SCIENCE AND EDUCATION IN KARAKALPAKSTAN

Science Magazine

chief editor:

Reymov A.M.

Deputy editor in chief:
B.Utemuratov

Executive secretary:
Sh.N.Abdinazimov

Editorial board:

Ayimbetov N.K. Dr of Economic Sciences academician
Turdimambetov I.R. Doctor of Geography
Ataniyazova O.A. Dr of Medical sciences
Ubaydullaev Kh. Dr of Economic Sciences
Umarova Q.U. Doctor of Law
Berdimuratova A.K. Doctor of Phylosophy
Abdullaeva J.A. Dr of Hist. Sciences
Arziev A.Dj. PhD in Phys-math Sciences
Ayimbetov M.J. PhD in Technical Sciences
Auezov O. Doctor of Tech. Sciences
Baimanov K.I. Dr of Technical Sciences
Bokieva G. Doctor of Philology
Imomov N.F. Doctor of Law
Jarimbetov K.H. Doctor of Philology
Juginisov T.I. Dr of Biol. Sciences
Ismayilov K.A. Dr of Phys-math sciences
Kayypbergenov B.T. Dr of Tech. Sciences
Kayypbergenov A.T. Dr of Tech. Sciences
Kuranbaev K. Doctor of Philology
Kudaybergenov K.K. Dr of Phys-math sciences
Kushiev H. Dr of Biol. Sciences
Mambetullayeva S.M. Dr of Biol. Sciences
Murtazayeva A.D. Dr of Hist. Sciences
Muslimov N. Doctor of Pedagogy
Nizamatdinov K.K. PhD in Law sciences
Nishonova Z.T. Dr of Psychology sciences
Nurimbetov B.Ch. PhD in Chem. sciences
Oripova M.H. Dr of Tech. Sciences
Rakhmonov I.U. Dr of Tech. Sciences
Razhapov A. Dr of Tech. Sciences
Sadullaev A. Dr of Phys-math sciences, acad
Seypullaev J.X. Dr of Phys-math sciences
Tagaev M.B. Dr of Phys-math sciences
Toreniyazov E.Sh. Dr of Agr. Sciences
Topildiev B.R. Doctor of Law
Utebayev T.T. Doctor of Pedagogy
Holbaev I. Dr of Phys-math sciences
Hursanov R.X. Doctor of Law
Duysenbaev O.I. PhD in Philology
Kurbanbaev T.K. PhD in Phys-math sciences
Egamberdiev F. Dr of Economic Sciences
Yuldashev J.I. Doctor of PhD of Law
Kalekeev K.J. PhD in Philology
Karlibaeva G.E. Doctor of Philology
Tleumuratov G. PhD in Philology
Kubeysinova D.T. PhD in Philology
Ismaylov B.A. PhD in Economic sciences
Kurbanbaev Dj. A. PhD in Pedagogy
Seytjanov J.E. PhD in Philology

ANALOGUE OF LELONG'S THEOREM FOR $\boldsymbol{\alpha}$-SEPARATELY HARMONIC FUNCTIONS

Abdikadirov S.M[1,2].
[1]*Karakalpak State University named after Berdakh*
[2]*Institute of Mathematics named after V.I. Romanovsky, Academy of Sciences of the Republic of Uzbekistan*
e-mail: subxan01102017@gmail.com

Summary. *This paper investigates α-separately harmonic functions and establishes an analogue of Lelong's theorem for these functions, where* $\boldsymbol{\alpha}$ *is a differential biform.*

Key words: *separately harmonic function,* $\boldsymbol{\alpha}$*-separately harmonic function, closed and strictly positive differential form.*

INTRODUCTION

As is well known, the class of separately harmonic functions, i.e., functions that are harmonic with respect to each variable when the others are fixed, plays a significant role in various problems of complex analysis, particularly in potential theory. The study of separately harmonic functions originates from the work of P. Lelong (see [1]). Subsequently, in the general setting, separately harmonic functions were investigated by many authors, including A. Zeriahi (see [2]) and J. Hecart (see [3]). In addition, A. Sadullaev and S. Imomkulov (see [4]) obtained results concerning the problem of analytic continuation of separately harmonic functions. The study of such functions is also closely related to the theory of separately analytic functions (see [5], [6]).

The well-known Hartogs theorem (see [7]) asserts *that a function* $f(z,w)$ *defined on a domain* $D\times G\subset\mathbb{C}^n(z)\times\mathbb{C}^m(w)$ *and holomorphic in each variable separately is holomorphic with respect to all variables in the domain.* In 1961, P. Lelong established the following analogue of this theorem for separately harmonic functions.

Theorem 1. (see [1]). *Let* $u(x,y)$ *be a separately harmonic function in a domain* $D\times G\subset\mathbb{R}^n(x)\times\mathbb{R}^m(y)$*; that is,* $u(x,y)$ *is harmonic in each variable when the others are fixed. Then* u *is harmonic with respect to all variables in* $D\times G$.

In this article, we introduce and study the concepts of $\boldsymbol{\alpha}$-separately harmonic functions. Under certain additional assumptions, we establish analogue of Lelong's theorem for these functions, where $\boldsymbol{\alpha}=(\alpha',\alpha'')$ denotes a differential biform.

PRELIMINARIES

We begin by recalling several fundamental notions required for the proof of the main results.

Let α be an arbitrary closed, strictly positive differential form of bidegree $(n-1,n-1)$ in a domain $D\subset\mathbb{C}^n$, given by

$$\alpha=\left(\frac{i}{2}\right)^{n-1}\sum_{j,k=1}^{n}\alpha_{jk}(z)dz[j]\wedge d\overline{z}[k],$$

where $\alpha_{jk}(z)\in Lip_\lambda(D)$ for all $j,\ k=\overline{1,n}$ and $0<\lambda<1$. The forms

$$dz\big[j\big]=dz_1\wedge\ldots\wedge dz_{j-1}\wedge dz_{j+1}\wedge\ldots\wedge dz_n,$$

$$d\overline{z}\big[k\big]=d\overline{z}_1\wedge\ldots\wedge d\overline{z}_{k-1}\wedge d\overline{z}_{k+1}\wedge\ldots\wedge d\overline{z}_n$$

are defined in the standard way. Moreover, the form α is closed, i.e. $d\alpha=0$.

Strict positivity of α means that for every compact set $G \Subset D$ there exists a constant $\varepsilon > 0$ such that the differential form $\alpha - \varepsilon\beta^{n-1}$ is positive on G, where $\beta = dd^c(|z|^2)$ denotes is the standard volume form in $\mathbb{C}^n$.

For any twice continuously differentiable function $u(z) \in C^2(D)$, $D \subset \mathbb{C}^n$, the operator $dd^c u \wedge \alpha$ can be represented as

$$dd^c u(z) \wedge \alpha(z) = \Delta_\alpha u(z) \cdot dV,$$

where

$$\Delta_\alpha u(z) = \sum_{j,k=1}^{n} \alpha_{j,k}(z) \frac{\partial^2 u}{\partial z_j \partial \overline{z}_k} = \sum_{j,k=1}^{n} \alpha_{j,k}(z)(\mathfrak{D}_j - i\mathfrak{D}_{n+j})(\mathfrak{D}_k + i\mathfrak{D}_{n+k})u(z),$$

$$dV = dx_1 \wedge dx_2 \wedge \ldots \wedge dx_{2n},\ \mathfrak{D}_j = \frac{\partial}{\partial x_j},\ j = \overline{1,2n}.$$

Definition 1 (see [8]). *A function $u(z) \in C^2(D)$ is called α-harmonic in $D \subset \mathbb{C}^n$ if $dd^c u \wedge \alpha = 0$ in D.*

Definition 2 (see [9]). *A function $u(z) \in L^1_{loc}(D)$ is called α-harmonic in $D \subset \mathbb{C}^n$ if the operator $dd^c u \wedge \alpha$ equals zero in the generalized sense:*

$$dd^c u(z) \wedge \alpha(z)(\omega) := \int u(z)\alpha(z) \wedge dd^c \omega(z) = 0,\ \forall \omega \in F(D).$$

Let α' be an arbitrary closed, strictly positive differential form of bidegree $(n-1, n-1)$ in a domain $D \subset \mathbb{C}^n(z)$, given by

$$\alpha' = \left(\frac{i}{2}\right)^{n-1} \sum_{j,k=1}^{n} \alpha'_{jk}(z) dz[j] \wedge d\overline{z}[k],$$

where $\alpha'_{jk}(z) \in Lip_\lambda(D)$, $0 < \lambda < 1$, and $d\alpha' = 0$.

Similarly, let α'' denote an arbitrary closed, strictly positive differential form of bidegree $(m-1, m-1)$ in a domain $G \subset \mathbb{C}^m(w)$, given by

$$\alpha'' = \left(\frac{i}{2}\right)^{m-1} \sum_{j,k=1}^{m} \alpha''_{jk}(w) dw[j] \wedge d\overline{w}[k],$$

where $\alpha''_{jk}(w) \in Lip_\lambda(G)$, $0 < \lambda < 1$, and $d\alpha'' = 0$.

Consider the operators acting in the class C^2:

$$d_z d^c_{\overline{z}} u(z,w) \wedge \alpha'(z) = \left(\frac{i}{2}\right)^{n} \sum_{j,k=1}^{n} (-1)^{k+j+1} \alpha'_{jk}(z) \frac{\partial^2 u(z,w)}{\partial z_j \partial \overline{z}_k} dz \wedge d\overline{z},\ \forall w \in G,$$

$$d_w d^c_{\overline{w}} u(z,w) \wedge \alpha''(w) = \left(\frac{i}{2}\right)^{m} \sum_{j,k=1}^{m} (-1)^{j+k+1} \alpha''_{jk}(w) \frac{\partial^2 u(z,w)}{\partial w_j \partial \overline{w}_k} dw \wedge d\overline{w},\ \forall z \in D.$$

Definition 3. *A function $u(z,w)$ is called $\boldsymbol{\alpha}$-separately harmonic in a domain $D \times G \subset \mathbb{C}^n(z) \times \mathbb{C}^m(w)$, where $\boldsymbol{\alpha} = (\alpha', \alpha'')$ is a biform, if it is locally integrable with respect to each variable and*

(i) $d_z d^c_{\bar{z}} u \wedge \alpha' = 0$ *in the generalized sense:*

$$\int u(z)\alpha'(z) \wedge d_z d^c_{\bar{z}} \omega(z) = 0\,,\ \forall \omega \in F(D)\,,$$

(ii) $d_w d^c_{\bar{w}} u \wedge \alpha'' = 0$ *in the generalized sense:*

$$\int u(w)\alpha''(w) \wedge d_w d^c_{\bar{w}} \omega(w) = 0\,,\ \forall \omega \in F(G)\,.$$

For an $\boldsymbol{\alpha}$-separately harmonic function w belonging to the class C^2, the following theorem holds.

Theorem 2. *If a function* $u(z,w) \in C^2(D \times G)$ *is* $\boldsymbol{\alpha}$*-separately harmonic, then with respect to the all variables*

$$dd^c u(z,w) \wedge \alpha(z,w) = 0\,,$$

i.e. $u(z,w)$ *is* α*-harmonic with respect to the total set of variables, where* $\alpha(z,w) = \alpha'(z) \wedge \alpha''(w) \wedge \beta$*, and* $\beta = dd^c\left(|z|^2 + |w|^2\right)$.

It should be noted that if the differential form α is real-analytic, then an α-harmonic function is also real-analytic.

MAIN RESULTS

As in the case of harmonic functions, to study the continuation of α-harmonic functions, we first reduce the problem to holomorphic functions and then apply the principles of holomorphic continuation. The following lemma will be useful for this purpose.

Lemma 1. *Let the differential form* α *be real-analytic in a domain* $D \subset \mathbb{C}^n \cong \mathbb{R}^{2n}$ *. Then there exists a domain* $\tilde{D} \subset \mathbb{C}^{2n}$ $\left(\mathbb{C}^n \cong \mathbb{R}^{2n} \subset \mathbb{C}^{2n}\right)$ *such that every* α*-harmonic function in* D *can be analytically (holomorphically) continued to* $\tilde{D}$.

Proof. Every α-harmonic function admits an integral representation. Indeed, if $B = B(x^0, R) \Subset D$ is an arbitrary ball and $u(x)$ is α-harmonic in D, then

$$u(z) = \int_{\partial B} P_\alpha(z,\xi) u(\xi) d\sigma(\xi)\,,$$

where $P_\alpha(z,\xi)$ denotes the Poisson kernel. Clearly, for each fixed $\xi \in \partial B$, the function $P_\alpha(z,\xi)$ is α-harmonic with on D. Since the differential form α is real-analytic in the domain $D \subset \mathbb{C}^n \cong \mathbb{R}^{2n}$, the kernel $P_\alpha(z,\xi)$ is also real-analytic in B, and hence it admits a a holomorphic continuation into some domain $\tilde{B} \subset \mathbb{C}^{2n}$ wiht $\tilde{B} \supset B$ .Thus, by the Poisson representation, any α-harmonic function in B can be holomorphically extended into $\tilde{B}$. Consequently, there exists a domain $\tilde{D}$ such that $D \subset \tilde{D} \subset \mathbb{C}^{2n}$. *The lemma is proved.*

Using this lemma together with the Siciak-Zakharyuta theorem (see [10], [11]) and Theorem 3, we can now establish the following analogue of Lelong's theorem for $\boldsymbol{\alpha}$-separately harmonic functions.

Theorem 3. *Let* α' *and* α'' *be real-analytic differential forms in the domains* $D \subset \mathbb{C}^n(z)$ *and* $G \subset \mathbb{C}^m(w)$*, respectively. Then every* $\boldsymbol{\alpha}$*-separately harmonic function* $u(z,w)$ *in* $D \times G$ *(where* $\boldsymbol{\alpha} = (\alpha', \alpha'')$*) is real-analytic and* α*-harmonic with respect to all variables:*

$$dd^c u(z,w) \wedge \alpha = 0\,,\ \forall (z,w) \in D \times G\,,$$

where $\alpha = \alpha'(z) \wedge \alpha''(w) \wedge \beta$, *and* $\beta = dd^c\left(|z|^2 + |w|^2\right)$.

Proof. Without loss of generality, assume that the domain $D \times G$ is bounded and that $u(z,w)$ satisfies the hypotheses of the theorem in a neighborhood of the closure $\overline{D} \times \overline{G}$. By Lemma 1, there exist domains $\tilde{D} \subset \mathbb{C}^{2n}$ and $\tilde{G} \subset \mathbb{C}^{2m}$ such that $u(z,w)$ can be separately analytically continued to the set

$$X = \left(D \times \tilde{G}\right) \bigcup \left(\tilde{D} \times G\right),$$

i.e., there exists a separately analytic function $\tilde{u}(z,w)$ defined on X with $\tilde{u}(z,w)\big|_{D\times G} = u(z,w)$. By the Siciak–Zakharyuta theorem (see [10], [11]), $\tilde{u}(z,w)$ admits a holomorphic extension to the domain

$$\tilde{X} = \left\{(\zeta,\eta) \in \tilde{D} \times \tilde{G} : \omega^*(\xi, D, \tilde{D}) + \omega^*(\eta, G, \tilde{G}) < 1\right\}.$$

Clearly, $D \times G \subset \tilde{X}$, hence $u(z,w)$ is real-analytic in all variables on $D \times G$. Finally, by Theorem 2, $u(z,w)$ is α-harmonic with respect to all variables, where $\alpha = \alpha'(z) \wedge \alpha''(w) \wedge \beta$ *. The theorem is proved.*

1. INTRODUCTION. PROBLEM STATEMENT

Let $\Omega \subset \mathbb{R}^n$ be an arbitrary bounded domain with piecewise smooth boundary $\partial\Omega$ and T>0 Consider in the cylinder $\Omega x(0,\mathrm{T})$ the following equation

$$u_{tt} - \Delta u_{tt} + \nu^2 \Delta u = f(x), \quad x \in \Omega, \ 0 < t < T, \tag{1}$$

where parameter ν is a positive number, $f(x) \in \mathrm{L}_2(\Omega)$

Let A be a positive self - adjoint extension of the Laplace operator

$$-\Delta : \mathrm{A}u = -\Delta u, \quad u \in C_0^{\infty}(\Omega),$$
$$(\mathrm{A}u, u) \geq \mu(u, u), \qquad \mu > 0, \quad u \in D(A).$$

We assume that A has a compact inverse operator A^{-1}. In particular, this self - adjoint extension may be produced by the boundary conditions like

$$\alpha(x)\frac{\partial u}{\partial n} + \beta(x)u = 0, \quad x \in \partial\Omega, \tag{2}$$

with some appropriate $\alpha(x)$ and $\beta(x)$. We consider non-local conditions

$$u(x,0) = u(x,T), \tag{3}$$

$$\int_0^T u(x,t)dt = \phi(x). \tag{4}$$

Equations of the form (1) are known as linearized Boussinesq-type equations (see [2, eq. 26], and it becomes necessary to study the solvability of such equations. For a review of results on boundary value problems for Boussinesq-type equations, including non-linear equations, see [3].

In [4] T.K.Yuldashev considered the problem of solvability and construction of a solution of a boundary value problem for equation of the from (1) where parameter ν^2 is standed by the sign - , with nonlocal conditions similar to (3)-(4) in the case $\Omega = \{x \in R \,|\, 0 < x < 1|\}$ (see [4, condition 6]). These results were developed in [1] for arbitrary domains $\Omega \subset R^N, N > 1.$

The purpose of this paper is to study the solvability and construction of a solution for equation (1) with initial conditions (3) and (4).

We define the solution of the problem (1), (3) and (4) as the function $u(x,t)$ which:

1) belongs to the domain $D(A)$ for every t from interval $0 \leq t \leq T$ and is continuous with respect to t in the norm of $\mathrm{L}_2(\Omega)$ on this interval;

2) together with the function $Au(x,t)$ is two times continuously differentiable on the open interval $(0,T)$ in the norm of $\mathrm{L}_2(\Omega)$;

3) satisfies the equation (1) and conditions (3), (4).

In order to formulate the results on existence and uniqueness we introduce some important parameters. Let λ_k and $\upsilon_k(x)$ be the eigenvalues and corresponding eigenfunctions of the self - adjoint operator A:

$$A\upsilon_k(x) = \lambda_k \upsilon_k(x), \qquad x \in \Omega. \tag{5}$$

The spectral decomposition of any function $\phi(x) \in \mathrm{L}_2(\Omega)$ has the form

$$\phi(x) = \sum_{k=1}^{\infty} \phi_k \upsilon_k(x), \quad \phi_k = (\phi, \upsilon_k).$$

According to our assumptions,

$\mu \le \lambda_1 \le \lambda_2 ... \le \lambda_k \to \infty$.

Set

$$\nu_k = \nu \sqrt{\frac{\lambda_k}{1+\lambda_k}}. \tag{6}$$

In this paper, the validity of the following statements is proved.

Theorem. *Let* $\phi \in D(A)$, $\tilde{f} \in D(\mathrm{A})$ *and* $\tilde{f} = (f(x), \upsilon_k)$. *Then the solution of the problem (1), (3) and (4) exists and is unique.*

Remark. If the self-adjoint extension of Laplace operator is generated by Dirichlet boundary value problem (i.e. when $\alpha = 0$ and $\beta = 1$ in condition (2)), then $D(A) = W_2^2(\Omega) \cap \overset{0}{W}{}_2^1$ (see [6], chapter 3, sec. 2).

The paper is organized as follows. In the next Section 2, we find the spectral expansion of the solution associated with eigenfunctions of self - adjoint operator A.

In the final Section 3, we prove Theorem 3.

2. SPECTRAL EXPANSION OF THE SOLUTION

We can rewrite (1) as

$(I + A)u_{tt} - \nu^2 Au = f(x)$

or

$$u_{tt} - \nu^2 A(I + A)^{-1} u = (I + A)^{-1} f(x), \qquad x \in \Omega, \quad 0 < \mathrm{t} < \mathrm{T}. \tag{7}$$

Assume that $u(x,t)$ is solution of the problem (7), (3) and (4). Then, the spectral decomposition of the solution has the form

$$u(x,t) = \sum_{k=1}^{\infty} C_k(t) \upsilon_k(x), \tag{8}$$

where

$C_k(t) = (u, \upsilon_k) = \int u(x,t) \upsilon_k(x,t) dx$

Multiplying equation (7) by $\upsilon_k(x)$, k =1,2,.. we obtain

$$(u_{tt}, \upsilon_k) - \nu^2 (A(I + A)^{-1} u, \upsilon_k) = ((I + A)^{-1} f(x), \upsilon_k) \tag{9}$$

According to definition of the solution, we have

$$(u_{tt}, \upsilon_k) = \frac{d^2}{dt^2}(u, \upsilon_k) = C_k''(t).$$

Recall that operator A is self - adjoint. Taking into account the equation (5), we can write

$$(A(I + A)^{-1} u, \upsilon_k) = (u, A(I + A)^{-1} \upsilon_k) = \frac{\lambda_k}{1+\lambda_k}(u, \upsilon_k) = \frac{\lambda_k}{1+\lambda_k} C_k(t)$$

$$((I + A)^{-1} f(x), \upsilon_k) = (f(x), (I + A)^{-1} \upsilon_k) = \frac{1}{1+\lambda_k}(f(x), \upsilon_k) = \tilde{f}$$

Using the notation (6), we can write

$$v^2(A(I+A)^{-1}u,\upsilon_k)=\nu_k^2C_k(t). \qquad (10)$$

Therefore it follows from (9) and (10) that the equation

$C_k''(t)-\nu_k^2C_k(t)=\tilde{f}$

is valid. Hence,

$$C_k(t)=a_k\operatorname{ch}\nu_kt+b_k\operatorname{sh}\nu_kt+\tilde{C}(t)$$

where $\tilde{C}(t)=-\dfrac{\tilde{f}}{\nu_k^2}$

then we have $C_k(t)=a_k\operatorname{ch}\nu_kt+b_k\operatorname{sh}\nu_kt-\dfrac{\tilde{f}}{\nu_k^2}$. (11)

We add to this equation two conditions that follow from (3) and (4):

$$C_k(0)=C_k(T) \qquad (12)$$

$$\int_0^T C_k(t)dt=\phi_k \qquad (13)$$

Using (12), we obtain $a_k-\dfrac{\tilde{f}}{\nu_k^2}=a_k\operatorname{ch}\nu_kT+b_k\operatorname{sh}\nu_kT-\dfrac{\tilde{f}}{\nu_k^2}$.

Then we have $a_k(1-\operatorname{ch}\nu_kT)=b_k\operatorname{sh}\nu_kT$ or

$$-a_k\operatorname{sh}^2\frac{\nu_kT}{2}=b_k\operatorname{sh}\frac{\nu_kT}{2}\operatorname{ch}\frac{\nu_kT}{2}. \qquad (14)$$

As, all ν_k are different from zero, then we have $\operatorname{sh}\dfrac{\nu_kT}{2}\neq 0$. Then derive from (14) that

$$-a_k\operatorname{sh}\frac{\nu_kT}{2}=b_k\operatorname{ch}\frac{\nu_kT}{2}. \qquad (15)$$

Let $\operatorname{ch}\dfrac{\nu_kT}{2}\neq 0$. Set $d_k=\dfrac{a_k}{\operatorname{ch}\dfrac{\nu_kT}{2}}=-\dfrac{b_k}{\operatorname{sh}\dfrac{\nu_kT}{2}}$. Then, according to (11), we have

$$C_k(t)=d_k(\operatorname{ch}\frac{\nu_kT}{2}\operatorname{ch}\nu_kt-\operatorname{sh}\frac{\nu_kT}{2}\operatorname{sh}\nu_kt)-\frac{\tilde{f}}{\nu_k^2}.$$

Hence,

$$C_k(t)=d_k\operatorname{ch}\left[\nu_k(t-\frac{T}{2})\right]-\frac{\tilde{f}}{\nu_k^2}. \qquad (16)$$

Therefore, for the coefficients of the expansion (8) we get the equation (16). Further, according to (13), we have

$$\phi_k=\int_0^T C_k(t)dt=\int_0^T\left[d_k\operatorname{ch}\left[\nu_k(t-\frac{T}{2})\right]-\frac{\tilde{f}}{\nu_k^2}\right]dt=\frac{2d_k\operatorname{sh}\dfrac{\nu_kT}{2}}{\nu_k}-\frac{\tilde{f}T}{\nu_k^2}.$$

Therefore, it is true that

$$d_k=\frac{\phi_k\nu_k^2+\tilde{f}T}{2\nu_k\operatorname{sh}\dfrac{\nu_kT}{2}} \qquad (17)$$

Therefore, if the solution of the problem (1), (3) and (4) exists, then it has the following form

$$u(x,t)=\sum_{k=1}^{\infty}\left[\frac{\phi_k\nu_k^2+\tilde{f}T}{2\nu_k\,\mathrm{sh}\,\frac{\nu_k T}{2}}\mathrm{ch}\left[\nu_k(t-\frac{T}{2})\right]-\frac{\tilde{f}}{\nu_k^2}\right]\upsilon_k(x)\,. \tag{18}$$

Hence, we proved the validity of the following statement.

Proposition 2.1. *Let the function* $u(x,t)$ *be the solution of the problem (7), (3) and (4) for* $\phi\in L_2(\Omega)$ *. Then its spectral expansion has the form (18).*

Recall that the function $u(x,t)$ to be a solution of the considered problem, it is necessary that it and its second derivatives in t belong to the domain of the definition of the operator A. So, the following two statements relate to these conditions.

Proposition 2.2. *The function* $u(x,t)$ *defined by expansion (18) belongs to* $D(A)$ *uniformly with respect to* $t>0$ *if and only if*

$$\sum_{k=1}^{\infty}\frac{\left[|\phi_k|\lambda_k^2+\tilde{f}T\right]^2}{\nu_k{}^2\,\mathrm{sh}^2\,\frac{\nu_k T}{2}}<+\infty\ . \tag{19}$$

Proof. Applying operator *A* to equation (18), we obtain the following equation

$$Au(x,t)=\sum_{k=1}^{\infty}\lambda_k\left[\frac{[\phi_k\nu_k^2+\tilde{f}T]}{2\nu_k\,\mathrm{sh}\,\frac{\nu_k T}{2}}\mathrm{ch}\left[\nu_k(t-\frac{T}{2})\right]-\frac{\tilde{f}}{\nu_k^2}\right]\upsilon_k(x) \tag{20}$$

Hence, from (20) we have

$$\|Au(\cdot,t)\|^2=\sum_{k=1}^{\infty}\lambda_k{}^2\left[\frac{[\phi_k\nu_k^2+\tilde{f}T]}{2\nu_k\,\mathrm{sh}\,\frac{\nu_k T}{2}}\mathrm{ch}\left[\nu_k(t-\frac{T}{2})\right]-\frac{\tilde{f}}{\nu_k^2}\right]^2.$$

It follows that the inequality $\|Au(\cdot,t)\|^2\le\mathrm{const}$, $0\le t\le T$, holds when the following condition

$$\sum_{k=1}^{\infty}\lambda_k{}^2\left[\frac{[\phi_k\nu_k^2+\tilde{f}T]}{2\nu_k\,\mathrm{sh}\,\frac{\nu_k T}{2}}\mathrm{ch}\left[\nu_k(t-\frac{T}{2})\right]-\frac{\tilde{f}}{\nu_k^2}\right]^2\le\mathrm{const},\quad 0\le t\le T \tag{21}$$

is met.

Note that the definition (6) implies the inequality

$$\frac{\mu}{\mu+1}\nu^2\le\nu_k{}^2<\nu^2\,. \tag{22}$$

Hence, estimate (21) is valid if and only if the condition (19) is satisfied.

Proposition 2.3. *Let the condition (19) be fulfilled. Then the functions* $u(x,t)$ *and* $Au(x,t)$ *are two times continuously differentiable with respect to* $t>0$.

Proof. Differentiating equation (20), we obtain the following equation

$$\frac{\partial^2}{\partial t^2}Au(x,t)=\sum_{k=1}^{\infty}\frac{\lambda_k\nu_k[\phi_k\nu_k^2+\tilde{f}T]}{2\,\mathrm{sh}\,\frac{\nu_k T}{2}}\mathrm{ch}\left[\nu_k(t-\frac{T}{2})\right]\upsilon_k(x)\,.$$

Applying Parseval's equality, we get

$$\| \frac{\partial^2}{\partial t^2} Au(\cdot,t) \|^2 = \sum_{k=1}^{\infty} \frac{\lambda_k{}^2 \nu_k{}^2 [\phi_k \nu_k^2 + \tilde{f}T]^2}{4 \operatorname{sh}^2 \frac{\nu_k T}{2}} \operatorname{ch}^2 \left[\nu_k (t - \frac{T}{2}) \right].$$

Taking into account (22), we may state that the estimate

$$\| \frac{\partial^2}{\partial t^2} Au(x,t) \| \leq \text{const}$$

is valid if and only if the condition (19) is satisfied.

3. PROOF OF THEOREM

In this case the uniqueness of the solution follows immediately from Proposition 2.1.

According to Propositions 2.2 and 2.3, to prove the Theorem , it is enough to check that the series (19) converges.

Using the inequalities (22), we obtain

$$\frac{\operatorname{sh}(\nu_k T / 2)}{\nu_k T / 2} > \frac{\operatorname{sh}(\sqrt{\frac{\mu}{\mu+1}} \nu T / 2)}{\nu T / 2}$$

Then we have that

$$\operatorname{sh}(\nu_k T / 2) > \frac{\nu_k}{\nu} \operatorname{sh}(\sqrt{\frac{\mu}{\mu+1}} \nu T / 2) = \sqrt{\frac{\lambda_k}{1+\lambda_k}} \operatorname{sh}(\sqrt{\frac{\mu}{\mu+1}} \nu T / 2)$$

Therefore, the following estimate is true

$$\operatorname{sh}(\nu_k T / 2) > C_\nu(T) > 0, \tag{23}$$

$$C_\nu(T) = \sqrt{\frac{\lambda_1}{1+\lambda_1}} \operatorname{sh}(\sqrt{\frac{\mu}{\mu+1}} \nu T / 2)$$

According to assumption, $\phi \in D(A)$. Since $A\phi(x) = \sum_{k=1}^{\infty} \lambda_k \phi_k \upsilon_k(x),$ we have

$$\| A\phi \|^2 = \sum_{k=1}^{\infty} \lambda_k{}^2 \left| \phi_k \right|^2 < +\infty . \tag{24}$$

It follows from (23) and (24) that the series (17) converges.

Summary: *Although the saprobity levels in the studied fish farms of the territorial region were not analyzed, the ecological and sanitary condition of each pond was explained based on the quantitative indicators of indicator-saprobic species. In addition, the influence of polluting sources is also noted.*

Keywords: *Fish ponds' algoflora, indicator-saprobes, ecology-sanitation.*

Analysis of sources on the topic. Significantly fewer studies have been conducted on the analysis of indicator-saprobic species in the algoflora of fishery ponds and the assessment of the ecological and sanitary state of water through them. The algoflora of fishery ponds from existing water bodies in the territory of Southern Tajikistan was studied. M.T. Boboev (2018), 245 species. The role of a number of ecological factors in the formation of the algoflora of fish ponds in this area is explained. At the same time, it provides an analysis of indicator-saprobic species in these fishery ponds.

Sh.Sh. Shernazarov (2021), who separately analyzed the indicator-saprobic species in the algoflora of a number of fish ponds in the Samarkand region, noted that the algoflora of the studied ponds contains 144 indicator-saprobic species, which constitutes 55.81% of the total number of species. Of these, 66 species are oligosaprobes, 42 species are beta-mesosaprobes, 22 species are xenosaprobes, and 14 species are alpha-mesosaprobes. Although the saprobity levels in the studied fish farms of the region were not analyzed, the ecological and sanitary condition of each pond was explained depending on the quantitative indicators of indicator-saprobic species. In addition, the influence of polluting sources is also noted.

However, in the above-mentioned sources, the degree of occurrence of indicator-saprobic species in the algoflora of the ponds of fish farms studied in both sources, saprobity indices, and the degree of water pollution, as well as pollution classes, were not analyzed.

Y.Sh. Tashpulatov (2016, 2018), who studied the algoflora of the middle reaches of the Zarafshan River, separately analyzed the indicator-saprobic species in the composition of the river's algoflora and noted that the ecological and sanitary state of the river changes seasonally and along the flow.

Similar studies revealed the ecological situation in artificial and natural water bodies as a result of analyzing the quantitative and qualitative indicators of indicator-saprobic species in the algoflora of various basins of the Western Zarafshan Range (B.Dustov, 2024).

B.Kabulova (2025), who studied indicator-saprobic species in the algoflora of Lake Khadicha, located in the territory of Bukhara region, as a separate group, studied the ecological and sanitary state of the lake by seasons and the years of research. In addition, a cadastre of indicator-saprobic species was developed (Kabulova, 2023).

In the course of our research, a separate analysis of the studied indicator-saprobic species was carried out in the section of ponds of fish farms and in the section of seasons. These studies are significant not only for the first time in this region, but also on a republican scale.

Object and methods of the study. According to the analysis of the research results, the average saprobity index of water in the reservoirs of the Khojeyli fish farm in spring was 1.60, in summer it increased to 1.78, and by autumn it slightly decreased to 1.76. The water class (3), discharge (3a - sufficiently clean) and indicators of the saprobic zone (β1-mesosaprobe) did not

change in all seasons. These results show that the deterioration of the ecological and sanitary condition of the Khojeyli fishery ponds increases significantly from spring to summer, and although this decreased somewhat by autumn, according to the general indicators, it remained moderate throughout the year (Table 1).

Table 1

Ecological and sanitary condition of the ponds of the Khodzheyli fish farm

Division		**Spring**	**Summer**	**Autumn**
Cyanoprocaryota		1,79	1,79	1,79
Dinophyta		1,6	1,6	1,6
Chrysophyta		1	2	2
Bacillariophyta		1,52	1,46	1,60
Euglenophyta		2,4	2,4	2,4
Cholorophyta		1,5	1,43	1,21
Average saprobity index		1,60	1,78	1,76
Water quality	class	3	3	3
	discharge	3a (sufficiently clean)	3a (sufficiently clean)	3a (sufficiently clean)
Saprobic zone		β^1-mezosaprobic	β^1-mezosaprobic	β^1-mezosaprobic

According to the analysis of the research results, the average saprobity index of water in the ponds of the Khojeyli fish industry fish farm in spring was 1.70, in summer it increased to 1.98, and by autumn it slightly decreased to 1.65. The water class (3), discharge (3a - sufficiently clean) and indicators of the saprobic zone (β1-mesosaprobe) did not change in all seasons. These results show that the deterioration of the ecological and sanitary condition of the fishery ponds of the Khojeyli fish industry increases significantly from spring to summer, and although this decreased somewhat by autumn, according to general indicators, it remained moderate throughout the year (Table 2).

Table 2

Ecological and sanitary condition of fishery ponds of the Khojeyli fish industry

Division		Spring	Summer	Autumn
Cyanoprocaryota		1,78	1,78	1,74
Dinophyta		1,6	1,5	1,66
Chrysophyta		1	3	1
Bacillariophyta		1,24	1,27	1,17
Euglenophyta		3	3	3
Cholorophyta		1,6	1,35	1,35
Average saprobity index		1,70	1,98	1,65
Water quality	class	3	3	3
	discharge	3a (sufficiently clean)	3a (sufficiently clean)	3a (sufficiently clean)
Saprobic zone		β^1-mezosaprobic	β^1-mezosaprobic	β^1-mezosaprobic

Conclusion. According to the results of the analysis of quantitative and qualitative indicators of indicator-saprobic species in the algoflora of the studied ponds of fish farms, the ponds of the Khojaly fish industry fish farm are more polluted with organic substances compared to other ponds. These farm pools have been operating for several years. The sources of water supply are the Old Canal from the Amu Darya, wastewater from agricultural crops, and wastewater from residential areas. The ponds are equipped with special devices for feeding fish, the bottom of which is made of clay and gravel. The number of fish raised is significantly higher than in other fishery ponds. This, in turn, requires more feed. All these factors led to an increase in the amount of organic matter in the water. Therefore, this led to an increase in the quantity and quality of indicator-saprobic species compared to the ponds of other fish farms.

OBTAINING MICROSPHERICAL NANOHYBRID BIOPOLYMER/SILICA ADSORBENT FOR CHROMATOGRAPHY

Begimkulova Ch.K., Shakarova D.Sh.
Institute of General and Inorganic Chemistry of the Academy of Sciences of Uzbekistan

Summary: *Microspherical nanohybrid fibroin/silica adsorbent was synthesized in situ by sol-gel process based on silk fibroin and silica by introducing silk fibroin into hydrolytic polycondensation of tetraethoxysilane (TEOS). Synthesis was performed in 4% formic acid solution by adding NH_4OH as a catalyst, at different fibroin:TEOS ratios, at temperature from 50 ^oC to 80 ^oC and high stirring rate. It can be seen that the synthesis process takes several minutes. Obtained samples were characterized by nitrogen porosimetry and scanning electron microscopy with EDS. Results of elemental analysis indicate the presence of both fibroin (by C, O, N) and silicon dioxide (by Si) in the composition of the obtained adsorbent. The obtained adsorbent consists of microspherical particles with dimensions of 10-30 μm, with a pore size of 23 nm and a surface area of 318 m^2/g. The possibility of studying the obtained adsorbent in thin-layer chromatography is demonstrated by the effective separation of a test mixture of nitroaniline isomers.*

Key words: *biopolymer, tetraethoxysilane, fibroin, sol-gel process, nanohybrid, fibroin/silica adsorbent, hybrid material, o-, m-, p-, nitroanilines, thin-layer chromatography.*

Introduction: In recent years, significant progress has been made in the obtaning of stable hybrid materials using the sol-gel process based on natural biopolymers and inorganic materials [1]. Research into the production of hybrid materials based on multicomponent materials, proteins belonging to the class of biopolymers, and inorganic substances opens up new opportunities for the creation of innovative solutions in various fields, such as sorption technologies, biomedicine, electronics and ecology [2].

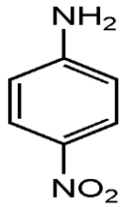
Currently, known options for synthesizing nanomaterials, such as polymer-inorganic and hybrid materials, make it possible to obtain a new generation of nanohybrid adsorbents with unique properties. Of particular interest are hybrid materials based on biopolymers and silica, which have attracted the attention of scientists due to their unique combination of mechanical properties, biocompatibility and functional potential [3].

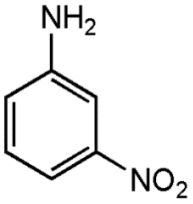
The choice of biopolymers for the synthesis of nanohybrid adsorbents plays a key role in ensuring their properties and functionality. Biopolymers such as chitosan [4], alginates [5], and fibrillar protein [6] have unique characteristics that can significantly affect the results of the sol-gel process. These polymers not only provide the necessary mechanical strength and stability, but also contribute to the creation of a microstructure with specific adsorption properties, which is of paramount importance for chromatography. Hybridization with silica-containing components can increase the surface area and reactivity, which improves the interaction with target molecules. However, the choice of a specific biopolymer should take into account both its chemical compatibility with silica matrices and the influence of the sol-gel process conditions on its behavior. Among the biopolymers, silk fibroin, obtained from silkworm cocoons (Bombyx mori), has attracted the attention of researchers due to its mechanical and biochemical properties, namely biocompatibility and biodegradability. The use of biopolymer/silica adsorbents synthesized by the sol-gel technology opens new horizons in the development of effective materials for chromatographic separation.

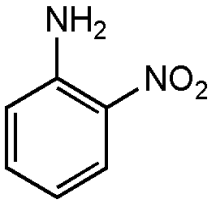
The aim of this work is to obtain biopolymer/silica microspherical nanohybrid adsorbent based on fibroin and tetraethoxysilane by the sol-gel process in situ and their application for planar (thin layer) chromatography.

Object and methods of research: Formic acid, tetraethoxysilane, lithium bromide, 25% ammonium hydroxide solution, isopropyl alcohol, n-hexane, o-, m- and p- nitroaniline, ethyl acetate, hydrochloric acid, sodium carbonate, sodium hydroxide, benzene, crystalline iodine, deionized water. All reagents were obtained from Sigma- Aldrich and were used without further purification. Microspherical silica gel (MS) was obtained using the method described in [7]. Regenerated silk

fibroin was obtained from the cocoons of the silkworm Bombyx mori, cultivated by farmers in our Republic, using the processes of degumming, dialysis of fibroin solution in an aqueous solution of lithium bromide and lyophilization of the resulting fibroin solution.







Nanohybrid microspherical fibroin/silica adsorbent was obtained according to the method of our previous work [8]. Samples obtained at ratios of 0.02:1, 0.03:1 (fibroin: TEOS) were named AFS2, AFS3, respectively.

The synthesized biopolymer/silica adsorbent was characterized by scanning electron microscope SEM-EDS Jeol JSM-IT200LA (Japan) using energy dispersive analyzer application.

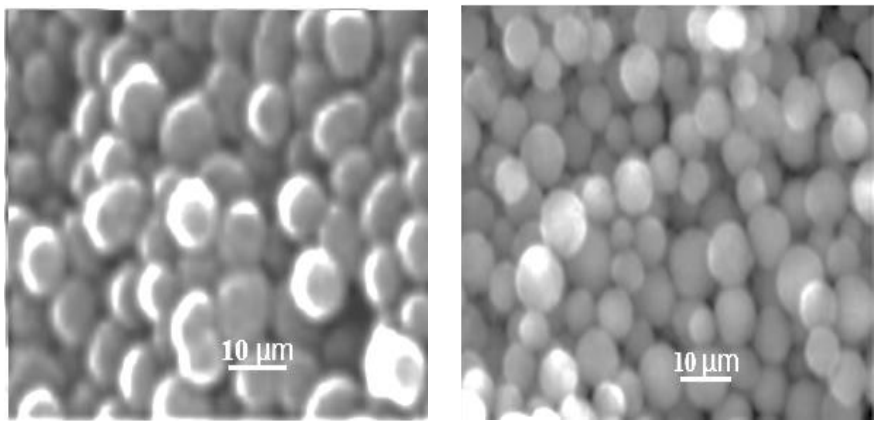
The structural characteristics of fibroin/silica nanohybrid samples were determined by low-temperature nitrogen adsorption at 77 K using a Quantachrome Nova 1000e static adsorption system.

Chromatography in a thin layer of fibroin/silica adsorbent was performed on the glass plate with dimensions of 10x10 cm. For the study, 1% benzene solutions of o-, m and p- nitroaniline and structural the formulas of which are presented in Table 1.

Table 1. Structural formula of the investigated nitroaniline isomers.

Substance number		
1	2	3
 4-nitroaniline	 3-nitroaniline	 2-nitroaniline

The eluent for separating isomeric nitroanilines on fibroin/silica nanohybrid adsorbents was a mixture of benzene with ethyl acetate in the ratio of 4:1. Iodine vapor is used as a developer.



Results and discussion: The influence of temperature, pH of the system, the ratio of the initial reagents and the reaction time on the morphology and porosity of the final product was studied in our previous work [8]. From the results, it was noted that an increase in temperature promotes the complete development of the polymerization process, which in turn improves the adsorption properties of the material. In addition, variations in the pH of the medium affect the distribution of microparticles in the matrix and affects the final shape and properties of the adsorbent. As a result of careful control of the conditions for obtaining fibroin/silica adsorbents based on the sol-gel process, the optimal conditions for obtaining the target material for planar chromatography were found. We found that the optimal conditions for the synthesis of microspherical fibroin/silica adsorbent is the fibroin-TEOS ratio of 0.03:1, the amount of catalyst of 2.3 ml, the temperature of 60 ^{0} C and the stirring speed of 1800 rpm. The conditions of sol-gel synthesis of materials significantly affect their physicochemical properties. The obtained samples of microspherical nanohybrid biopolymer/silica adsorbents AFS2 and AFS3 were studied for their physicochemical properties and used as a stationary phase for the separation of nitroaniline isomers in thin-layer chromatography.

The structural characteristics of the obtained fibroin/silica adsorbents, given in Table 2, correspond to mesoporous adsorbents, which allow them to be used in chromatographic separations.

Table 2. Structural characteristics of microsphere silica gel and fibroin/silica sorbent samples

Structural characteristics	Samples		
	MS	AFS2	AFS3
Specific surface area $S_{sp,}$ m^2/g	287	297,238	318,348
Total volume $W_{0,}$ cm^3/g	0.24	1,018	1,032
Pore radius, nm	17	28.07	29.74

Fig. 1 shows the SEM results of the obtained AFS2 and AFS3 samples, and as can be seen from the images, the obtained adsorbents have the spherical shape.

(a) (b)

Fig. 1. SEM images of synthesized samples of AFS2(a) and AFS3(b)

form with a particle diameter from 5 to 30 µm. Elemental analysis of the obtained fibroin/silica sorbent samples at the ratio of the initial fibroin-TEOS reagents of 0.02:1 and 0.03:1, the results of which are given in Table 3, showed the presence of both fibroin (by the presence of C and N) and silica (by the presence of Si) in the samples.

Table 3. Elemental analysis of synthesized samples AKS2 and AKS3

Samples	Elemental analysis			
	C wt %	N wt %	O wt %	Si wt % [α]
AFS2	10.06±0.06	2.14±0.09	51.36±0.09	36.44±0.06
AFS3	26.29±0.05	3.04±0.09	48.93±0.06	24.78±0.03

[α] Calculated value

To separate nitroaniline isomers, we used nanohybrid fibroin/silica adsorbents and, microspherical silica gel for comparison. Since the particle size of these stationary phases is 10±1 µm, thin-layer chromatography using them is considered highly efficient. The results obtained are presented in Table 3 as Rf values.

From the presented data it is evident that the selectivity index of separation of nitroaniline isomers relative to each other ($\alpha_{n/n-1}$) >1 is equal to both for microspherical silica gel and for nanohybrid fibroin/silica adsorbents, which indicates complete separation of these substances.

Table 3. Results of thin layer chromatography of nitroaniline isomers

Substance number (n)	Microporous silica gel			Nanohybrid fibroin/silica adsorbent					
				AFS2			AFS3		
	R_f	$\alpha_{n/n-1}$	$\alpha_{n/1}$	R_f	$\alpha_{n/n-1}$	$\alpha_{n/1}$	R_f	$\alpha_{n/n-1}$	$\alpha_{n/1}$
1	0, 38			0.27			0.2 1		
2	0.42	1,1	1,1	0.34	1,2	1,2	0, 3 0	1.4	1.4
3	0, 51	1,2	1.3	0.49	1.4	1.8	0, 4 5	1.5	2.1

The obtained results show that the selectivity is higher on fibroin/silica adsorbents (AFS2 and AFS3) than on MS. A qualitative comparison of the obtained Rf thin layer chromatography values shows that the most effective separation of the nitroaniline isomers occurs on the nanohybrid fibroin/silica adsorbent (AFS3), since thin-layer chromatography allows for a clear identification of the nitroaniline isomers under study.

Based on the obtained results, it can be concluded that nanohybrid fibroin/silica adsorbents are a more effective mobile phase than silica gel for separating nitroaniline isomers by thin-layer chromatography, using benzene-ethyl acetate mixture in a volume ratio of 4:1 as the stationary phase.

This is due to the presence in the structure of fibroin/silica adsorbent of the combined effect on the chromatographic process of silanol groups together with NH_2 –, OH^-, and $COOH^-$ and other groups contained in the side peptide chains of the fibroin macromolecule. These groups provide the synthesized fibroin/silica adsorbents with active centers for the separation of various organic compounds.

Conclusions: Thus, mesoporous fibroin/silica adsorbent was synthesized based on silk fibroin and tetraethoxysilane by the sol-gel method and their physicochemical properties were studied. Structural analysis of the microspherical fibroin/silica adsorbent obtained under the found optimal conditions showed that the adsorbent with a pore size of 29 nm and the surface area of 318 m^2/g belongs to mesoporous structures and can be used as an adsorbent in thin-layer chromatography. SEM analysis showed that the morphology of the obtained adsorbent samples is microspheres, and the results of elemental analysis confirm the presence of fibroin and silica in the composition of the hybrid materials. It was found that the synthesized microspherical fibroin/silica adsorbent can be used as the suitable adsorbent for efficient separation of nitroaniline isomers in thin layer chromatography.

ANALYSIS OF PHOTOSYNTHETIC PIGMENTS IN MILLET LEAVES: CHLOROPHYLL AND CAROTENOIDS

Kurbanbaeva G.S.
Karakalpak State University named after Berdakh

Summary: *This article covers the millet plant, its biological characteristics, cultivation technology, requirements for climatic and soil conditions, and its importance as food and feed.*

The article also analyzes the method for applying triterpenoid-nature biostimulants created on the basis of polyisoprenoids—namely Glycyrrhizic Acid (GK), Indoleacetic Acid (ISK), Indoleacetic Acid + 4-aminoantipyrine (ISK:4AA), "GLITSBUT," and "GLINBUT"—to grain crops under the conditions of the Republic of Karakalpakstan. It examines their effect on growth and development, product quality, and certain biochemical parameters within them.

Furthermore, the correlation between different SPAD 502 indicators and the content of chlorophyll and carotenoids in millet leaves was determined.

Key words: *millet plant, food, biological properties, chlorophyll "a," chlorophyll "b," carotenoids*

INTRODUCTION.

The existence of the Aral Sea problem limits the possibilities of increasing grain production in our country by expanding crop areas. Currently, the development and implementation of technologies for cultivating crops that save water and energy during yield production, increase soil fertility, and ensure high and qualitative yields from grain crops, are being carried out. At present, the use of growth stimulants is considered one of the promising and sufficiently effective directions for increasing the level of yield.

These are analogs of plant phytohormones, which can be of both natural origin and synthesized by humans.Plant growth stimulants have a complex effect on the physiological and biochemical processes that occur in plant organs.

Their application allows for accelerating the onset of phenological phases and thus contributes to the overall shortening of the growing season, which, in turn, allows for a more rational use of agricultural machinery during harvesting. Plant growth stimulants are non-toxic and are considered safe for humans and the environment due to their origin. [5.28-29]

Growth stimulants are widely used in various agricultural crops. Studies were conducted on almost all cereal crops, and their positive effect was noted. [6. 15–18].

Grain crops belong to the most important group of cultivated plants, which are characterized by an extremely high diversity. They all belong to the family Gramineae (also known as Poaceae). This family is one of the largest, including over 500 genera and more than 5000 species of annual and perennial plants widely distributed all over the world. Food products, raw materials, and concentrates are obtained from grain crops. [7.22-23]

Millet (Tariq) is one of the very common cereal crops in Uzbekistan. The groats (psheno) prepared from its grain are famous for being tasty and nutritious. Bread made from millet is small in size and quickly goes stale. Millet waste (produced during processing) is good feed for cattle. The grain, either whole or ground, is given to poultry and pigs; 1 kg of grain contains 0.97 feed units (o.b.).

Its straw contains 0.51 feed units per 1 kg, and its chaff contains 0.42 feed units. Millet straw and chaff contain, respectively, 3.9% and 7.9% protein, 38.6% and 39.5% nitrogen-free extractives (NFE), 33.9% and 32.4% fiber (cellulose), 1.8% and 2.9% fat, and 5.8% and 19.6% ash. 5.1 kg of its green mass is equal to one feed unit. The starch content in the grain reaches 57.6%, and in the groats (psheno), it reaches 71%. Millet starch turns into sugar faster than rice starch. When millet groats are cooked in milk, their nutritional and biological properties increase. [8.174-175]

Millet is cultivated in Uzbekistan as a main and repeated (second) crop. Its importance is great for harvesting two grain yields per year. Its value is further enhanced by its low seeding rate, early maturity, and being a short-day plant. It can also be used to repair sparsely grown grain fields.

One variety of millet has been registered in the State Register for planting in Uzbekistan: Saratovskaya-853, created at the former Saratov experimental station, and zoned for planting in the conditional irrigated and rain-fed lands of our republic. [8.177-178]

In the Republic of Karakalpakstan, traditional farming methods are used in millet cultivation. Farmers utilize advanced technologies and knowledge passed down through generations to ensure high yield and product quality [7].

Millet products are widely used in local cuisine and hold a special place in the traditional culture of the Karakalpaks. Furthermore, millet cultivation in the Republic of Karakalpakstan has important economic and social significance, shaping the lifestyle of local communities and contributing to the regional agricultural economy in various ways.

First, millet farming provides employment for a large part of the population in the villages of Karakalpakstan. Millet cultivation involves a series of activities that create jobs and generate income for farmers and workers, from planting and harvesting to processing and sales.

Second, for many small farmers in Karakalpakstan, millet cultivation serves as an important source of income and a means of diversifying their livelihoods. By cultivating millet alongside other crops and engaging in livestock farming, farmers can mitigate risks associated with seasonal fluctuations and market volatility, thereby increasing their resilience to economic hardship. During the research process, it was determined that the field germination of the seeds, the seedling density, and the plant survival rate varied under the influence of the year's conditions and the growth regulators.

On the field experimental plot of the Nukus District Grain and Rice Research and Production Association, millet seeds were sown in field conditions after being pre-treated for 24 hours in prepared biostimulants of triterpenoid nature: GK, ISK, glitsBUT, and ISK:4AA at concentrations of 10^{-5}, 10^{-6}, and 10^{-7}, as well as a Control (distilled water). The research was carried out at the Shortanboy field experimental plot.

30-40-day-old millet leaves were selected, and the selected samples were homogenized in a centrifuge in 50 milligrams of 5 ml of a 95% ethyl alcohol solution and allowed to settle for 15 minutes. Pigments in plant leaves are an important physiological process. The SPAD 502

Figure 1. Sowing of millet seeds at the field experimental plot of the Nukus District Scientific-Production Association of Grain and Rice

Spectrophotometer is used to detect them.

EXPERIMENTAL PART

The purpose of this study is to determine the correlation between different SPAD 502 indicators and the content of chlorophyll and carotenoids in millet leaves.

Photosynthesis is the main condition for life for plants, green algae, and some microorganisms. This complex biochemical process absorbs solar energy and synthesizes organic substances. The efficiency of the photosynthetic process is directly dependent on the amount of photosynthetic pigments in the plant leaves, such as chlorophyll 'a', chlorophyll 'b', and carotenoids. These pigments function to absorb light and convert it into chemical energy.

This article reviews the results of a scientific analysis on how the content of photosynthetic pigments changed in the leaves of the 'Saratovskoe 853' millet variety under the influence of various biostimulants. The effect of different concentrations (10^{-5}, 10^{-6}, 10^{-7}) of the biostimulants GK, ISK, GlitsBUT, and ISK:4AA on chlorophyll content and germination was investigated.

The main objective of the study is to assess the influence of 10−5, 10−6, and 10−7 concentrations of bio-growth substances, such as GK, ISK, Glycine BUT, and ISK:4AA, on the pigment composition of the millet plant. These substances are considered agents that accelerate plant growth and development and increase stress resistance. The control group (untreated plants) also participated in the experiment. The method of spectral analysis was used to determine the results of the experiment. Using this method, the indicators of light absorption (optical density) of plant leaves at a certain wavelength were measured, and based on this, the quantitative composition of pigments was calculated.

Figure 2. Determination of different SPAD 502 indicators and the content of chlorophyll and carotenoids in millet leaves.

RESULTS AND DISCUSSION

According to the analysis of the data obtained, the majority of the applied biostimulants increased the content of photosynthetic pigments in the millet leaves. This indicates that these substances significantly improve the photosynthetic activity of the plants.

For example, in millet plants treated with different concentrations of the GK biostimulant, the content of chlorophyll 'a', chlorophyll 'b', total chlorophylls, and carotenoids was higher compared to the control group. In particular, the 10^{-7} concentration of the GK substance recorded the highest results, confirming the positive effect of this substance on the photosynthetic apparatus.

SPAD 502 indicators of chlorophyll and carotenoid content in millet leaves

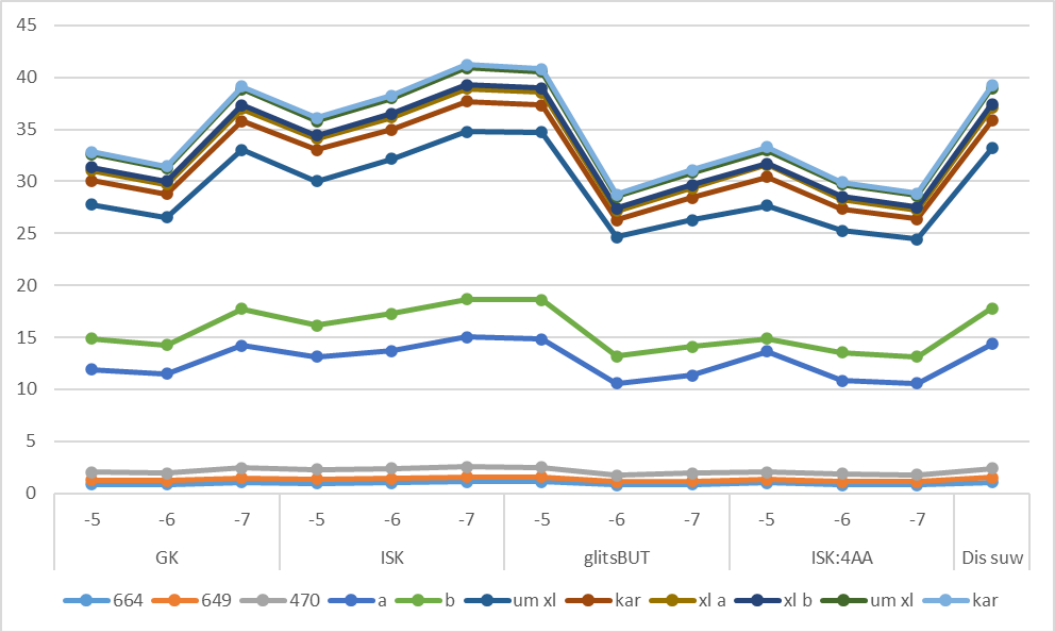

Table 1

Millet ***Saratovskaya—853***								
Biostimulator	Concentration mol/l	664	649	470	Chlorophyll *α*	Chlorophyll *β*	Total Chlorophyll	Carotenoid Content
GK	10^{-5}	0,883	0,37	0,785	0,98766	0,29791	1,2855	0,2303
	10^{-6}	0,852	0,352	0,747	0,95558	0,27371	1,2293	0,2237
	10^{-7}	1,054	0,44	0,934	1,17978	0,35107	1,5309	0,2756
ISK	10^{-5}	0,967	0,396	0,933	1,08639	0,30102	1,3874	0,2991
	10^{-6}	1,014	0,431	0,953	1,13102	0,35887	1,4898	0,2813
	10^{-7}	1,114	0,462	0,98	1,24853	0,3627	1,6112	0,2918
glitsBUT	10^{-5}	1,102	0,465	0,935	1,23094	0,38067	1,6116	0,2619
	10^{-6}	0,791	0,329	0,605	0,88603	0,26016	1,1461	0,1625
	10^{-7}	0,84	0,35	0,73	0,94059	0,27797	1,2185	0,2136
ISK:4AA	10^{-5}	1,002	0,34	0,71	1,16221	0,119	1,2812	0,2769
	10^{-6}	0,803	0,337	0,72	0,89791	0,27236	1,1702	0,2117
	10^{-7}	0,787	0,325	0,658	0,88276	0,25243	1,1351	0,1915
Control	N1	1,043	0,441	0,908	1,16457	0,36275	1,5273	0,2578

At this concentration, the content of total chlorophylls was 1.5309 mg/g, which signifies a significant increase compared to the control group. The substances ISK and glitsBUT also showed a positive effect on the pigment composition of the millet plant. Specifically, the 10^{-7}concentration of ISK increased the total chlorophyll content up to 1.6112 mg/g. This result indicates that this substance also plays an important role in enhancing the plant's photosynthetic potential.

Furthermore, the 10^{-5} concentration of the glitsBUT substance demonstrated one of the highest indicators, reaching a total chlorophyll content of 1.6116 mg/g. This suggests that the substance at this concentration is effective in increasing the green mass and enhancing the yield of the millet plant.

Analysis of the content of chlorophyll "a," chlorophyll "b," total chlorophyll, and carotenoids in millet leaves

The germination of seeds sown in the experimental field, that is, according to the initial germination indicators, in the control variant, millet was 60%.

***Growth rate of grain crops grown under the influence of biostimulants in the conditions of the Republic of Karakalpakstan (%)**

Table 2

Biostimulants	Conc. (molar)	Germination, %
		Tarı 3000079 (Saratovskoe 853)
Control (dist.water)	-	60
GK	10^{-5}	84
	10^{-6}	74
	10^{-7}	79
ISK	10^{-5}	83
	10^{-6}	89
	10^{-7}	79
ISK :4AA	10^{-5}	78
	10^{-6}	78
	10^{-7}	78
Glits BUT	10^{-5}	67
	10^{-6}	74
	10^{-7}	66

In this case, the **highest germination rate** in millet was observed with the ISK 10^{-6} M (89%) concentration, followed by ISK 10^{-5} M (83%), GK10^{-5} M (84%), ISK:4AA (78 %), and GlitsBUT 10^{-6} (74 %). Considering these concentrations, ISK 10^{-6} M showed the highest result.The results clearly indicate that higher germination rates were observed across various compositions compared to the control variant.

Diagram of the germination rate of the 'Saratovskoe 853' millet variety grown in the conditions of the Republic of Karakalpakstan under the influence of biostimulants.

Conclusion

This study presents a scientifically grounded method for applying triterpenoid-nature biostimulants, created on the basis of polyisoprenoids, to the 'Saratovskoe 853' millet variety. It is possible to increase the yield by enhancing the activity of the plant's photosynthetic apparatus.

The ISK and GK biostimulants provided a high level of germination in tests conducted at various concentrations (approximately 83-89%). The germination rate of ISK at a lower concentration (10^{-6} M) was slightly higher (89%) , indicating that this substance is effective even at

a low concentration. GK, on the other hand, showed a germination rate almost equal to ISK at 10^{-5} M (84 %).

Therefore, the germination effectiveness of the ISK and GK substances is high and at a similar level, but ISK may also work effectively at a lower concentration. These results create new opportunities for increasing efficiency in agricultural practice and seed production.

Summary. *This paper investigates* ***α-separately subharmonic functions*** *and establishes an* ***analogue of Lelong's theorem*** *for these functions. An analogue of Lelong's theorem is proved under additional assumptions, where* $\boldsymbol{\alpha}$ *is a* ***differential biform****.*

Key words: *separately subharmonic function,* $\boldsymbol{\alpha}$*-separately subharmonic function, closed and strictly positive differential form.*

INTRODUCTION

The well-known Hartogs theorem (see [1]) asserts *that a function* $f(z,w)$ *defined on a domain* $D\times G\subset\mathbb{C}^n(z)\times\mathbb{C}^m(w)$ *and holomorphic in each variable separately is holomorphic with respect to all variables in the domain.* In 1961, P. Lelong established the following analogue of this theorem for separately harmonic functions.

Theorem 1. (see [2]). *Let* $u(x,y)$ *be a separately harmonic function in a domain* $D\times G\subset\mathbb{R}^n(x)\times\mathbb{R}^m(y)$*; that is,* $u(x,y)$ *is harmonic in each variable when the others are fixed. Then* u *is harmonic with respect to all variables in* $D\times G$*.*

Since the publication of Lelong's aforementioned work, separately harmonic, separately R-analytic, and separately subharmonic functions have become the subject of study for many authors. The main focus has been directed toward the following problem: *Is a separately subharmonic function subharmonic with respect to the totality of variables?* The answer to this question is negative. More precisely, in 1988, Jan Wiegerinck (see [3]) constructed an example of a separately subharmonic function that is not subharmonic with respect to all variables taken together.

Under additional assumptions, this question has been studied in the works of various authors, including V. Avanissian [4], M. G. Arsove [5], J. Riihentaus [6], as well as D. H. Armitage and S. J. Gardiner [7], where important results were obtained.

Further advances in the study of separately subharmonic functions are associated with additional conditions, such as harmonicity or real analyticity with respect to one group of variables.

In this article, we introduce and study the concepts of **α**-separately subharmonic functions. Under certain additional assumptions, we establish analogue of Lelong's theorem for these functions, where $\boldsymbol{\alpha}=(\alpha',\alpha'')$ denotes a differential biform.

PRELIMINARIES

We begin by recalling several fundamental notions required for the proof of the main results.

Let α be an arbitrary closed, strictly positive differential form of bidegree $(n-1,n-1)$ in a domain $D\subset\mathbb{C}^n$, given by

$$\alpha=\left(\frac{i}{2}\right)^{n-1}\sum_{j,k=1}^{n}\alpha_{jk}(z)dz[j]\wedge d\bar{z}[k],$$

where $\alpha_{jk}(z) \in Lip_{\lambda}(D)$ for all $j, k = \overline{1, n}$ and $0 < \lambda < 1$. The forms

$$dz[j] = dz_1 \wedge ... \wedge dz_{j-1} \wedge dz_{j+1} \wedge ... \wedge dz_n,$$

$$d\overline{z}[k] = d\overline{z}_1 \wedge ... \wedge d\overline{z}_{k-1} \wedge d\overline{z}_{k+1} \wedge ... \wedge d\overline{z}_n$$

are defined in the standard way. Moreover, the form α is closed, i.e. $d\alpha = 0$.

Strict positivity of α means that for every compact set $G \Subset D$ there exists a constant $\varepsilon > 0$ such that the differential form $\alpha - \varepsilon\beta^{n-1}$ is positive on G, where $\beta = dd^c(|z|^2)$ denotes is the standard volume form in $\mathbb{C}^n$.

For any twice continuously differentiable function $u(z) \in C^2(D)$, $D \subset \mathbb{C}^n$, the operator $dd^c u \wedge \alpha$ can be represented as

$$dd^c u(z) \wedge \alpha(z) = \Delta_{\alpha} u(z) \cdot dV,$$

where

$$\Delta_{\alpha} u(z) = \sum_{j,k=1}^{n} \alpha_{j,k}(z) \frac{\partial^2 u}{\partial z_j \partial \overline{z}_k} = \sum_{j,k=1}^{n} \alpha_{j,k}(z)(\mathfrak{D}_j - i\mathfrak{D}_{n+j})(\mathfrak{D}_k + i\mathfrak{D}_{n+k})u(z),$$

$$dV = dx_1 \wedge dx_2 \wedge ... \wedge dx_{2n}, \ \mathfrak{D}_j = \frac{\partial}{\partial x_j}, \ j = \overline{1, 2n}.$$

Definition 1 (see [8]). *A function $u(z) \in C^2(D)$ is called α-subharmonic in $D \subset \mathbb{C}^n$ if $dd^c u \wedge \alpha \geq 0$ in D.*

Definition 2 (see [9]). *A function $u(z) \in L^1_{loc}(D)$ is called α-subharmonic in $D \subset \mathbb{C}^n$ if*

(i) it is upper semicontinuous in D, i.e.

$$\overline{\lim_{z \to z^0}} u(z) \leq u(z^0), \ \forall z^0 \in D$$

(ii) the operator $dd^c u \wedge \alpha$ is positive in the generalized sense, that is,

$$dd^c u(z) \wedge \alpha(z)(\omega) := \int u(z)\alpha(z) \wedge dd^c \omega(z) \geq 0, \ \forall \omega \in F(D), \ \omega \geq 0.$$

Let α' be an arbitrary closed, strictly positive differential form of bidegree $(n-1, n-1)$ in a domain $D \subset \mathbb{C}^n(z)$, given by

$$\alpha' = \left(\frac{i}{2}\right)^{n-1} \sum_{j,k=1}^{n} \alpha'_{jk}(z) dz[j] \wedge d\overline{z}[k],$$

where $\alpha'_{jk}(z) \in Lip_{\lambda}(D)$, $0 < \lambda < 1$, and $d\alpha' = 0$.

Similarly, let α'' denote an arbitrary closed, strictly positive differential form of bidegree $(m-1, m-1)$ in a domain $G \subset \mathbb{C}^m(w)$, given by

$$\alpha'' = \left(\frac{i}{2}\right)^{m-1} \sum_{j,k=1}^{m} \alpha''_{jk}(w) dw[j] \wedge d\overline{w}[k],$$

where $\alpha''_{jk}(w) \in Lip_{\lambda}(G)$, $0 < \lambda < 1$, and $d\alpha'' = 0$.

Consider the operators acting in the class C^2:

$$d_z d_{\bar{z}}^c u(z,w) \wedge \alpha'(z) = \left(\frac{i}{2}\right)^n \sum_{j,k=1}^{n} (-1)^{k+j+1} \alpha'_{jk}(z) \frac{\partial^2 u(z,w)}{\partial z_j \partial \bar{z}_k} dz \wedge d\bar{z}\,,\ \forall w \in G\,,$$

$$d_w d_{\bar{w}}^c u(z,w) \wedge \alpha''(w) = \left(\frac{i}{2}\right)^m \sum_{j,k=1}^{m} (-1)^{j+k+1} \alpha''_{jk}(w) \frac{\partial^2 u(z,w)}{\partial w_j \partial \bar{w}_k} dw \wedge d\bar{w}\,,\ \forall z \in D\,.$$

Definition 3. *A function* $u(z,w)$ *is called* $\boldsymbol{\alpha}$*-separately subharmonic in a domain* $D \times G \subset \mathbb{C}^n(z) \times \mathbb{C}^m(w)$*, where* $\boldsymbol{\alpha} = (\alpha', \alpha'')$ *is a biform, if it is locally integrable and upper semicontinuous with respect to each variable, and the following conditions are satisfied:*

(i) The operator $d_z d_{\bar{z}}^c u \wedge \alpha'$ *is positive in the generalized sense:*

$$\int u(z)\alpha'(z) \wedge d_z d_{\bar{z}}^c \omega(z) \geq 0\,,\ \forall \omega \in F(D)\,,\ \omega \geq 0\,.$$

(ii) The operator $d_w d_{\bar{w}}^c u \wedge \alpha''$ *is positive in the generalized sense:*

$$\int u(w)\alpha''(w) \wedge d_w d_{\bar{w}}^c \omega(w) \geq 0\,,\ \forall \omega \in F(G)\,,\ \omega \geq 0\,.$$

For an $\boldsymbol{\alpha}$-separately subharmonic function w belonging to the class C^2, the following theorem holds.

Theorem 2. *If a function* $u(z,w) \in C^2(D \times G)$ *is* $\boldsymbol{\alpha}$*-separately subharmonic, then with respect to all variables*

$$dd^c u(z,w) \wedge \alpha(z,w) \geq 0\,,$$

i.e. $u(z,w)$ *is* $\boldsymbol{\alpha}$*-subharmonic with respect to the total set of variables, where* $\alpha(z,w) = \alpha'(z) \wedge \alpha''(w) \wedge \beta$*, and* $\beta = dd^c\left(|z|^2 + |w|^2\right)$.

It should be noted that if the differential form α is real-analytic, then an α-harmonic function is also real-analytic.

MAIN RESULTS

As in the case of harmonic functions, to study the continuation of α-harmonic functions, we first reduce the problem to holomorphic functions and then apply the principles of holomorphic continuation. The following lemma will be useful for this purpose.

Lemma 1. *Let the differential form* α *be real-analytic in a domain* $D \subset \mathbb{C}^n \cong \mathbb{R}^{2n}$*. Then there exists a domain* $\tilde{D} \subset \mathbb{C}^{2n}$ $\left(\mathbb{C}^n \cong \mathbb{R}^{2n} \subset \mathbb{C}^{2n}\right)$ *such that every* α*-harmonic function in* D *can be analytically (holomorphically) continued to* $\tilde{D}$*.*

Under additional assumptions on an $\boldsymbol{\alpha}$-separately subharmonic function $u(z,w)$, the following theorem holds, which is an analogue of Lelong's theorem for $\boldsymbol{\alpha}$-separately subharmonic functions.

Theorem 3. *Let a real-analytic differential biform* $\boldsymbol{\alpha} = (\alpha', \alpha'')$ *be given in a domain* $D \times G \subset \mathbb{C}^n(z) \times \mathbb{C}^m(w)$*, and let* $u(z,w)$ *be a* $\boldsymbol{\alpha}$*-separately subharmonic function in* $D \times G$ *satisfying the following conditions:*

(i) For each fixed $w^0 \in G$*, the function* $u(z,w^0)$ *is real-analytic with respect to the variable* z*;*

(ii) For any fixed $z^0 \in D$ *, the function* $u(z^0, w)$ *is* α''*-harmonic with respect to the variable* w.

Then $u(z,w)$ *is a real-analytic* α*-subharmonic function in* $D \times G$ *with respect to all variables, where* $\alpha = \alpha'(z) \wedge \alpha''(w) \wedge \beta$.

Proof. Assume without loss of generality that $D \times G$ is bounded and that $u(z,w)$ satisfies the above assumptions in a neighborhood of $\bar{D} \times \bar{G}$.

By Lemma 1, for each fixed $w \in G$, the function $u(z,w)$ with respect to the variable z can be holomorphically extended from $\bar{D}$ to a certain domain $\tilde{D}_w \subset \mathbb{C}^{2n}$. Let $d(\bar{D}, \tilde{D}_w)$ denote the distance from $\bar{D}$ to $\partial \tilde{D}_w$. Denote by $\tilde{u}(\zeta, w)$ the holomorphic extension of the function $u(z,w)$ with respect to the first group of variables.

By the α''-harmonicity of the function $u(z,w)$, for every $z \in \bar{D}$ there exists a domain $\tilde{G} \subset \mathbb{C}^{2m}(\eta)$, with $\bar{G} \subset \tilde{G}$, such that $u(z,w)$ can be holomorphically extended from $\bar{G}$ to $\tilde{G}$; denote this function by $\hat{u}(z,\eta)$.

Define the following sequence of sets

$$E_k = \left\{ w \in \bar{G} : d(\bar{D}, \tilde{D}_w) \geq \frac{1}{k} \right\},\ k = 1, 2, \ldots .$$

Clearly, $\bigcup_{k=1}^{\infty} E_k = \bar{G}$. Since $\bar{G} \subset \mathbb{C}^m \cong \mathbb{R}^{2m} \subset \mathbb{C}^{2m}$ is non-pluripolar in $\tilde{G} \subset \mathbb{C}^{2m}(\eta)$, there exists an index l such that E_l is non-pluripolar in $\tilde{G}$. Fix a domain $\tilde{D} \subset \mathbb{C}^{2n}(\zeta)$ with $\bar{D} \subset \tilde{D} \subset \tilde{D}_w$ for all $w \in E_l$, and denote

$$E_l^M = \left\{ w \in E_l : \left|\tilde{u}(\zeta, w)\right| \leq M, \forall\, \zeta \in \tilde{D} \right\}.$$

Since $\bigcup_{N=1}^{\infty} E_l^M = E_l$, there exists M such that $E = E_l^M$ is non-pluripolar in $\tilde{G}$.

We now show that for each $w \in \bar{E}$, the function $u(\cdot, w)$ can be holomorphically extended from $\bar{D}$ to $\tilde{D}$. For $w \in E$, this is immediate. If w^0 is a limit point of E, take a sequence $\{w_l\} \subset E$ with $w_l \to w^0$. Since $\left|\tilde{u}(\zeta, w_l)\right| \leq M$ for all $\zeta \in \tilde{D}$, by Montel's theorem there exists a subsequence $\left\{\tilde{u}(\zeta, w_{l_k})\right\}_{k=1}^{\infty}$ converging uniformly on $\tilde{D}$. Let us note that the limiting function on $\bar{D}$ coincides with $\tilde{u}(z, w^0) = u(z, w^0)$; hence, it also coincides with $\tilde{u}(\zeta, w^0)$ in $\tilde{D} \cap \tilde{D}_{w^0}$. It then follows that $\tilde{D} \subset \tilde{D}_{y^0}$.

Thus, we have defined a separately analytic function $u(z,w)$ on

$$X = \left(\tilde{D} \times \bar{E}\right) \bigcup \left(\bar{D} \times \tilde{G}\right).$$

By the Siciak–Zakharyuta theorem (see [10], [11]), $u(z,w)$ can be holomorphically extended to the open set

$$\hat{X} = \left\{(z,w) \in \tilde{D} \times \tilde{G} : \omega^*(z,\overline{D},\tilde{D}) + \omega^*(w,\overline{E},\tilde{G}) < 1\right\}.$$

Since $D \times G \subset \hat{X}$, the function $u(x,y)$ is real-analytic and, by Theorem 2, α-subharmonic $D \times G$. *The theorem is proved.*

ECOLOGICAL ANALYSIS OF THE ALGOFLORA OF THE RESERVOIRS OF NUKUS AGROFISH FISH FARMS

Aitbayeva K.K[1]., Kaypov K.P[2].
[1]*Assistant Professor of Karakalpak State University and independent researcher of the Sharaf Rashidov Samarkand State University*
[2]*Doctor of Philosophy in Biological Sciences (PhD), Acting Associate Professor of Karakalpak State University*
**e-mail: qurbangulaytbaeva6@gmail.com*

Summary:. *In this article, scientific research is being conducted to observe the ecological changes observed in the water bodies of fish farms of the Republic of Karakalpakstan, to assess the pollution of water bodies under the influence of organic substances depending on the level of biodiversity, data are presented on the specific features of fish ponds in the regions, and the results of the analysis of the life forms of the algoflora of the studied territory showed that phytoplankton clearly leads in the studied water bodies, which were studied by dividing them into groups according to the number of species.*

Key words: *Algoflora fish ponds, leadership, phytobenthos, periphyton, littoral, epiplanton*

Analysis of sources on the topic. A number of studies have been conducted on the algoflora of artificial reservoirs, their ecological features, and the regularities of the formation of algoflora in reservoirs in Central Asia and other regions (Nomokonova V.I., Pautova V.N. Pervichnaya 2013. , Alimjanova Kh.A., Tashpulatov Y.Sh., 2014, M.T. Boboev, 2018. Shernazarov Sh.Sh., 2021; Tashpulatov I.Sh., Kobulova B.B., 2015)

Object and methods of the study. The study of the algoflora of fish ponds in Karakalpakstan, through the analysis of the ecological characteristics of the species in it, plays an important role in thinking about the algoflora as a whole and in understanding the features of its formation.

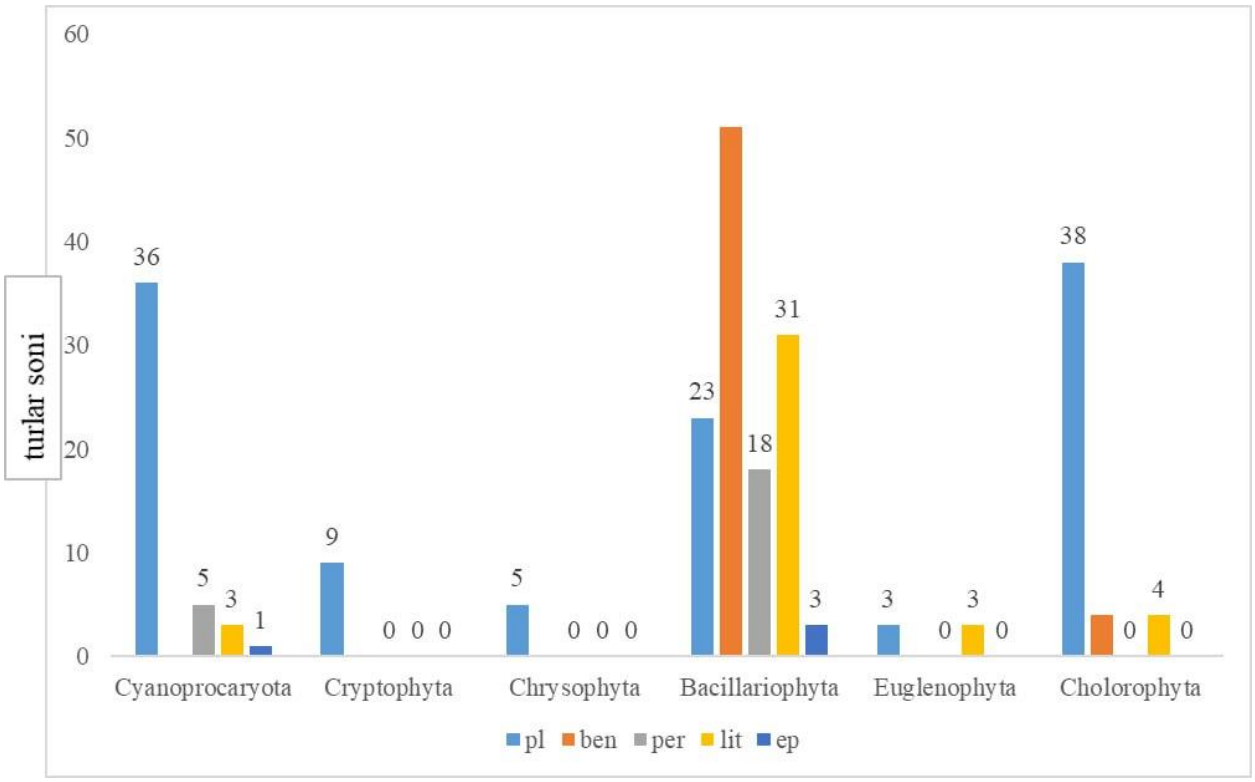
The obtained results and their analysis. The results of the analysis of the life forms of the algoflora showed that in the studied water bodies, phytoplankton clearly dominated, constituting 114 species, which accounted for 48.10% of the total algoflora. The following places are occupied by phytobenthoses, containing 55 species - 23.21%, periphyton - 23 species - 9.70%, littoral - 41 species - 17.30%, epiplanton - 4 species - 16.88%. Typical phytoplants include *Merismopedia elegans, Gomposphaeria lacustris* (blue-green), *Lindavia bodanica, Cyclotella meneghiniana, Diatoma tenuis* (diatom), *Peridiniopsis quadridens, Peridinium bipes, Parvodinium pusillum* (dinophyte), *Euglena deses, E. gracilis, E. salina* (evglena*), Chlamydomonas atactoga*ma, *Ch. Incerta, Chlorogonium elongatum* (green) can be cited as examples.

Phytobenthos include *Fragilaria construens* Ehr, *Navicula bacillum* Ehr (diatom), *Ulothrix tenuissima* Kutz *Oedogonium oblongum* Wittr. (green) is an example.

The following table shows the distribution of life forms of algae by sections (Table 1).

Table 1.

Distribution of life forms of algae by sections



Division	p	%	b	%	per	%	L	%	ep	%
Cyanoprocaryota	36	31,58	0	0	5	21,74	3	7,32	1	25
Dinophyta	9	7.89	0	0	0	0	0	0	0	0
Chrysophyta	5	4,38	0	0	0	0	0	0	0	0
Bacillariophyta	23	20.17	51	92,73	18	78,26	31	75,61	3	75
Euglenophyta	3	2,63	0	0	0	0	3	7,32	0	0
Cholorophyta	38	33,33	4	7,27	0	0	4	9,75	0	0
	114	**100**	**55**	**100**	**23**	**100**	**41**	**100**	**40**	**100**

Note: p - plankton, b - benthos, L - littoral; per - periphyton, earth-epiplactone

Bentos *was found in the Department of Green Algae: Ulothrix tenuissima* Kutz *, U. zonata (L.)* Ehr. *Morch.* Kutz., *Oedogonium oblongum* Wittr, *Cladophora glomerata* Kutz. (1.69%) species.

Identified in the Department of Litoral Green Algae *Zygnema. pectinalis (*Vauch.*) Ag. emend. Czurda, Spirogyra varians (*Hass.) Kutz *, Euastrum . Dentikulatum (*Kirchn *.) Gay , Micrasterias (1.69%) of species.*

As can be seen from the analysis, planktonic algae occupy a leading place in the algoflora of the studied water bodies. This is a characteristic feature of all non-flowing water bodies. From this, it can be concluded that phytoplankton has a significant share in these water bodies, which indicates the presence of favorable conditions for the initial feeding stages of herbivorous fish and all fish fry that feed on phytoplankton.

Note: p - plankton, b - benthos, L - littoral; per - periphyton, earth-epiplactone

Conclusion. From this, it can be concluded that phytoplankton has a significant share in these water bodies, which indicates the presence of favorable conditions for the initial feeding stages of herbivorous fish and all fish fry that feed on phytoplankton.

NITROPHOSPHORUS FERTILIZERS OBTAINED BASED ON AMMONYUM SELITER AND AMMOPHOS

Tanirbergenova Z.B., Madenov B.D., Reymov A.M.
Karakalpak State University named after Berdakh

***Summary**: The article states that granulated ammonium nitrate containing from 2.33 to 12.08% P2O5 is obtained by adding powdered ammophos to the ammonium nitrate melt. It has been shown that the strength of saltpeter granules increases from 1.60 MPa to 6.94 MPa with the addition of ammophos in the amount of 12.08% P2O5, and the porosity decreases from 8.64 to 7.66%.*

The article describes the production of granulated ammonium nitrate with a P2O5 content of 2.33 to 12.08% by introducing powdered ammophos into its melt. It was shown that the strength of nitrate granules increases from 1.60 MPa without the addition of ammophos to 6.94 MPa with the addition of ammophos in the amount of 12.08% P2O5, and the porosity of granules decreases from 8.64 to 7.66%.

This article described the production of ammonium nitrate with a P2O5 content of 2.33 to 12.08% by injecting powdered ammophos into its melt. It was shown that the strength of saltpeter grains increases from 1.6 MPa without additional ammophos to 6.94 MPa with the addition of ammophos in the amount of 12.08% P2O5, but the porosity of the grains under it decreases from 8.64 to 7.66%.

***Key words:** ammonium nitrate, nitrate fertilizer, Makham-Chirchik, ammophos (Ammophos-Maxam), P2O5 (phosphorus pentoxide), N (nitrogen), granulation, granule strength, porosity, crystallization temperature, melt, oxidizing property, storage and transportation rules, agrochemical efficiency*

Ammonium nitrate is one of the most effective and widely used nitrogen fertilizers in the world. In Uzbekistan, three large industrial enterprises - OAO "Maxam-Chirchik," OAO "Navoiazot," and OAO "Ferganaazot" - produce it for agriculture. The combined capacity of these three plants is over one million tons of saltpeter per year. However, this fertilizer has two very serious drawbacks - its caking tendency during storage and increased explosion hazard [1, 2]. If they have learned to combat caking by introducing various additives (calcium and magnesium salts, sulfate, sulfate-phosphate, sulfate-phosphate borate additives) into the saltpeter [3], then the problem of explosion safety has not been fully resolved.

It is known that pure ammonium nitrate is an oxidizer capable of maintaining combustion [4]. Under normal environmental conditions, ammonium nitrate is a stable substance. When heated in a closed space, when the thermal decomposition products cannot be freely removed, saltpeter can explode under certain conditions. It is also capable of detonating when exposed to a strong impact load or initiated by explosives.

1921 г1947 г2001 г2004 гIt is known to the human community that explosions occurred during the violation of the rules for handling ammonium nitrate and fertilizers based on it during their storage and transportation (September 21 at the plant's warehouse in the city of Oppau, Germany; April 16 on a ship in the Bay of Texas City, USA; September 21 at the plant's warehouse in Toulouse, France; April 22. at the Ryonqchon railway station, North Korea, etc.) [5].

We also know that many accidents and terrorist acts using ammonium nitrate have occurred over the past century [6]. The Irish Republican Army (IRA) began using ammonium nitrate in terrorist acts for the first time. During the IRA's activities (1969-1994), 14,000 explosions were carried out. At the height of the explosions in the early 70s, the British government banned the sale of ammonium nitrate to Northern Ireland. Similar restrictions were also introduced in Ireland. But, despite this, two major explosions were carried out in London.

A series of ammonium nitrate terrorist acts in Southeast Asia, Russia, the USA, and Uzbekistan, carried out at the beginning of the 21st century, put ammonium nitrate consumers and producers in a

difficult situation. A number of countries - China, the Philippines, Colombia, Ireland - have banned the use of ammonium nitrate in agriculture.

In this regard, worldwide, the search is underway for fertilizers based on ammonium nitrate that retain agrochemical effectiveness, have significantly greater resistance to external influences, and, consequently, a lower explosion hazard.

0,1 ммWe decided to obtain stabilized ammonium nitrate by introducing finely ground powder - ammophos, produced at "Ammofos-Maxam" OJSC, into its melt. Granulated ammophos was ground in a porcelain mortar to particle size. Amofos composition: P_2O_5 - 46.5%, N - 10.1%.

The ammonium nitrate produced by OJSC "Maxam-Chirchik" was melted in a metal bowl on an electric stove. Powdered ammophos was introduced into the melt in such a quantity that the final product contained from 2.0 to 12.0% P_2O_5.

1 ммAs the preliminary results showed, adding ammophos to the ammonium nitrate melt significantly reduces the melt's crystallization temperature (Table. Therefore, the resulting mixture was cooled to 155^0C with constant stirring. Then the melt was poured into a granulator, which is a metal beaker with a perforated bottom, the diameter of the holes in which is equal to. A pump created pressure in the upper part of the glass and sprayed the melt from the ninth floor of the building onto the polyethylene film lying on the ground. After this, the strength of the granules was measured, and the granules were then ground and analyzed according to known methods [7].

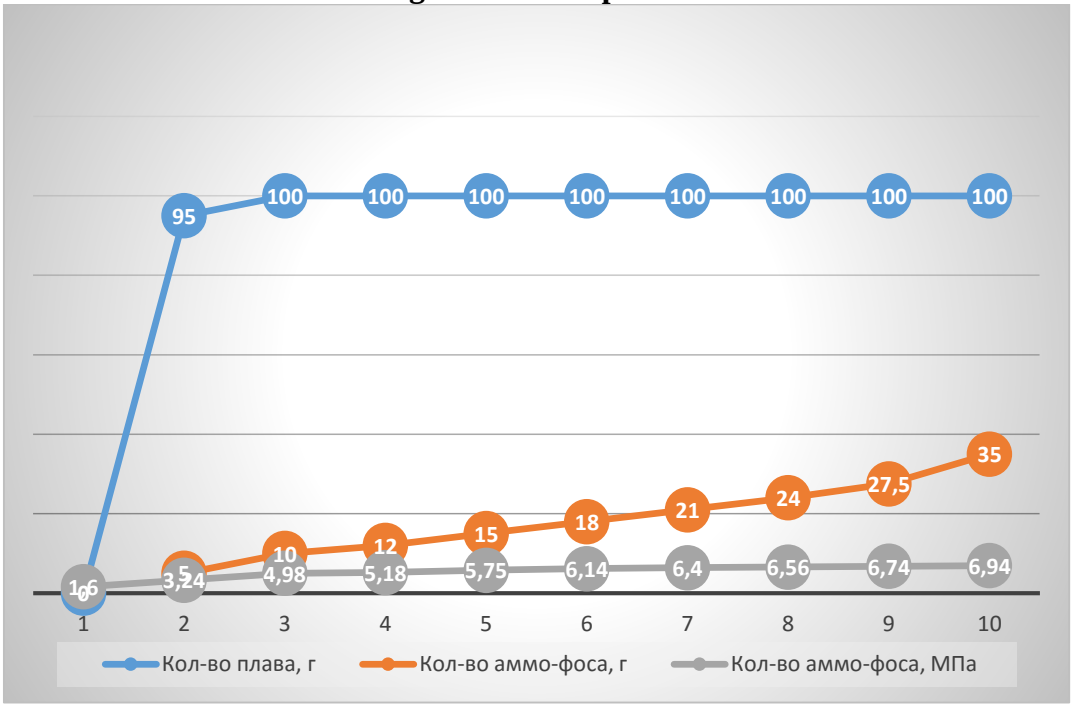
100.	35,0	28,01	12,08	11,42	11,78	10,37	94,53	97,51	85,84



The table shows that at all ratios of ammonium nitrate: ammophos, high-concentrated nitrogen-phosphorus fertilizers with a nitrogen content of 28.01-33.31% and a phosphorus content of 2.33-12.08% are obtained. The amount of phosphate additive practically does not affect the relative content of assimilable and water forms P2O5 in the finished product.

The strength of granules is one of the most important indicators characterizing stabilized ammonium nitrate. We determined this indicator using the method [8]. The test results are presented in the table. 2. Ammonium nitrate with a 12-% additive P_2O_5 has the highest granule strength of 6.94 MPa. Such granule strength indicates a decrease in porosity and the internal specific surface area of

the nitrate, which means a decrease in the penetration of diesel fuel into the granule, leading to a decrease in the detonation capacity of the nitrate.

Figure 1

Strength of granules of fertilizers obtained by introducing ammonium nitrate into the melt of ground ammophos

10 гThe porosity of the granules is also one of the quality indicators of ammonium nitrate. The porosity value of the granules was determined by the volumetric method [3]. The essence of determining the porosity of granules using this method was as follows. A certain amount of cryoscopic benzene (V_1) was poured into a 25 ml burette equipped with a tap. Then, ammonium nitrate or nitrogen-phosphorus fertilizer, obtained by introducing ammophos into its melt, was added to it, and after 1-2 minutes, the changed volume in the burette was recorded (V_2). Then the tap was opened and the benzene between the fertilizer granules was discharged into the second burette (also 25 ml) and its volume was measured (V_3). The porosity (in percent) was calculated using the formula:

$$П = \frac{V_1 - V_3}{V_2 - V_3} \times 100$$

For porous ammonium nitrate used as a component of explosive mixtures, this indicator is 20% or more. For ordinary ammonium nitrate - 9.15%.

The results of the experimental data are presented in Figure 1. The obtained data show that the addition of ammophos to the ammonium nitrate melt in an amount of from 2.33 to 12.08% in terms of P_2O_5 contributes to a decrease in the porosity of the granules of the obtained nitrogen-phosphorus fertilizers from 8.64 to 7.66%.

Thus, by introducing ground ammophos into the melt of ammonium nitrate, it is possible to obtain concentrated nitrogen-phosphorus fertilizers with improved physicochemical properties.

BIOECOLOGICAL PROPERTIES AND AGROTECHNOLOGY OF THE MEDICINAL PLANT *CICHORIUM INTYBUS* L.-IN THE TERRITORY OF KARAKALPAKSTAN

Abdiniyazova G.J., Toreniyazova S.E.
Karakalpak State University named after Berdakh

Summary: *The article provides information on the agricultural technology, composition, use, distribution, and raw materials of Cichorium intybus L. in laboratory conditions, including seed germination studies in water-soaked and control variants, as well as field experiments.*

Key words: *Karakalpakstan, medicinal plants, Asteraceae family, life form, folk medicine, agricultural technology*

INTRODUCTION

The search for new species of medicinal plants to expand the range of domestic herbal remedies remains a pressing area of modern pharmacy. Studying the chemical composition of both organic and inorganic substances is a necessary step in substantiating the pharmacological action of drugs during their development. Plants of the chicory genus (*Cichorium* L.) represent promising candidates for herbal remedy development. The most common species both cultivated and wild, is common chicory. Common chicory (*Cichorium intybus* L.) belongs to the genus Chicory (*Cichorium*) of the *Asteraceae* family. The plant has sedative, choleretic, diuretic, anthelmintic, and anti-inflammatory properties. It regulates metabolism, improves digestion, lowers blood sugar levels, and somewhat improves cardiac function. Chicory also has astringent, antimicrobial, antiparasitic, and antipyretic properties. Tincture of this plant improves appetite, digestion, and has a calming effect on the nervous system.

MATERIALS AND METHODS

Cichorium intybus L.– In our country, chicory is mainly found in alfalfa among irrigated crops. Chicory begins to grow in March-May, blooms and bears fruit from July to October. It is a plant that reproduces by seeds. The roots of chicory contain up to 20% inulin. In addition, the roots and leaves of chicory contain a large amount (up to 11%) of polysaccharides, insulin, proteins (4%), glycoside intebelin, which are unique in their own way. Organic acids are vitamins - thiamine, riboflavin, ascorbic acid, carotene; seeds contain 15-28% fatty oil, young leaves contain dacarotene, ascorbic acid (up to 0.08%), inulin, potassium salts. It is used instead of starch or sugar in diabetes, helps digestion and soothes the stomach. It is also recommended to consume the plant when the spleen and spleen organs are disturbed. The plant is also useful for the heart. The inflorescences of the plant are an effective tool for the normal functioning of the heart. In addition, the plant is widely used as a fever reducer. The plant has many other medicinal properties. Namely, it is an expectorant, antimicrobial, anti-inflammatory, and is used in the treatment of liver and gastrointestinal tract diseases. In folk medicine, decoctions are prepared from its roots and used for skin diseases and to improve metabolism.

RESULTS AND DISCUSSION

The agrotechnology of cultivation of *Cichorium intybus* L. was studied in the conditions of Karakalpakstan. The seeds of the plant were sown in Petri dishes in laboratory conditions at temperatures of +10-13^{0}C, +15-18 ^{0}C, +20-23 ^{0}C, and the results obtained are presented in Table 1.

Table 1

Germination of Cichorium intybus L. seeds under laboratory conditions (2024 seeds)

After observation in laboratory conditions, the plant Cichorium intybus L. was studied in field experimental conditions by sowing seeds in March, April, and May 2024 and 2025(table 2,3,4,5). The effect of sowing dates on the growth and development of the plant was also studied (Table 2).

To study the fertility of *Cichorium intybus* L. in field conditions, the plant was planted four times and the average was taken(Table 3). The results obtained in March, April and May are presented below(Table 4).

Agrotechnology of cultivation: The *Cichorium intybus* L. plant is considered a wild plant that grows naturally along the banks of ditches, among various plant crops. However, the medicinal properties of this plant and its use in other fields require its cultivation in field areas.

Tillage and seeding: Initially, the experimental area was cleared of weeds and the planting area was determined as 1 m2. There were 5 rows, with a row spacing of 15 cm. It is noted in the literature that 3-25 thousand seeds can be obtained from one sachratqi ball.

It was determined that one ball of seeds planted in the experimental area contained up to 10-20 seeds. A total of 50 seeds were sown in each row, 10 seeds, at a depth of 1 cm. The plant grows well on moderately dry and moist soils. The soil should be enriched with organic matter and have a normal pH. The plant does not grow well in saline or constantly wet soil [4.5.7]. Two seeds were sown 15-20 cm from the marked moisture line, and the seeds were covered with a thin layer of dry soil from 1-3 cm to 4-5 cm above this line. The moisture around the seeds should be maintained for 3 days (late sowing / warmer) to 5 days (early sowing / cooler).

ON CONVERGENCE OF DIFFERENCE SCHEMES FOR A NONLINEAR PROBLEM

Yarlashov R.Sh.
Karakalpak State University named after Berdakh
E-mail: rinatyarlashov@gmail.com

Summary: *In this paper, difference schemes are constructed for a nonlinear problem of quasistationary processes in semiconductors with a stationary distribution of free charge current sources. The finite difference method is used to discretize the spatial variable, and the resulting system of nonlinear ordinary differential equations is solved by the first- and second-order Euler methods. Based on the theory of difference equations, stability conditions for the difference schemes are obtained, as well as a priori estimates of convergence.*

Key words*: nonlinear pseudo-parabolic equation, difference equation, difference schemes, stability, uniform stability, convergence, accuracy.*

1. Introduction. Many applied problems require the solution of non-classical Sobolev-type equations. Numerical methods play a key role in tackling such problems arising in filtration theory, semiconductor physics, biology, ecology, and hydrology. Among these, finite difference methods are particularly important in numerical analysis, as they reduce the solution process to a finite number of arithmetic operations, making the implementation straightforward.

Typically, numerical approaches are employed to solve nonlinear, time-dependent initial–boundary value problems. The method of lines is commonly used to approximate differential equations by discretizing only the spatial variables. The resulting system of nonlinear ordinary differential equations is then solved using Runge–Kutta methods of various orders of accuracy. One of the main challenges in the analysis of difference schemes lies in proving their stability and obtaining *a priori* convergence estimates between the discrete and continuous solutions.

Recently, much attention has been given to developing and analyzing numerical methods for pseudoparabolic equations that contain a linear operator in the time derivative. Analytical treatments of such problems can be found in [1]–[4], while numerical approaches are presented in [5]–[9]. In [5], L^2-stable difference schemes, known as Complex Rosenbrock Schemes (CROS), were developed for both linear and nonlinear pseudoparabolic equations with initial–boundary conditions. Reference [6] discusses the construction of schemes on quasi-uniform grids for related problems. These works primarily focus on the formulation and implementation of the schemes but do not address their stability or convergence properties. In [7] and [8], finite difference and finite element methods were applied to construct and analyze high-order schemes for linear pseudoparabolic equations.

In this paper, we construct and analyze a difference scheme for a nonlinear problem arising in semiconductor theory. The method of lines is first employed to discretize the spatial variables. The resulting Cauchy problem for a nonlinear ordinary differential equation is then solved using Euler methods. Based on the theory of difference equations developed in [9], we derive stability conditions for the proposed scheme and obtain *a priori* convergence estimates.

2. Problem statement. In domain $\overline{Q}_T = \left\{(x,t): x \in \overline{\Omega} = [0 \le x \le l],\ t \in [0,T]\right\}$, we consider the following initial-boundary value problem for a nonlinear pseudo-parabolic equation:

$$\frac{\partial}{\partial t}(\Delta u - u) + u^3 = f(x,t),\ \ (x,t) \in Q_T, \tag{1}$$

$$u(x,0) = u_0(x),\ \ x \in \overline{\Omega}, \tag{2}$$

$$u\big|_{\partial\Omega} = 0,\ \ t \in (0,T], \tag{3}$$

where $\Delta = \dfrac{\partial^2}{\partial x^2}$ - is the one-dimensional Laplace operator, $Q_T = \Omega \times (0,T]$, $\Omega = \{0 < x < l\}$.

Equation (1) describes quasistationary processes in semiconductors in the presence of a stationary distribution of free charge current sources. The solvability and uniqueness of the solution to problem (1)–(3) are given in [1].

3. Spatial Discretization. Let us construct subspace $\overset{\circ}{H}_h$ approximating H –Hilbert space with scalar product (u,ϑ) and norm $\|\cdot\|$. Here, $\overset{\circ}{H}_h$ – is the space of discrete functions vanishing at the boundary points. We approximate equation (1) by the finite difference method with respect to the spatial variable and introduce uniform grid $\bar{\omega}_h = \{x = ih,\ i = \overline{0,N},\ h = l/N\}$ in domain $\bar{\Omega}$. Here $\bar{\omega}_h = \omega_h + \gamma_h$. Further, we define subspace $H_h = H_0^1(\omega_h)$ – the space of grid functions $\vartheta(x)$ with norm $\|\vartheta\|_1^2 = \sum_{i=0}^{N} h(\vartheta_{\bar{x}})^2 \le M$, where constant M is independent of h, where $\vartheta = \vartheta_i = \vartheta(ih)$, $\vartheta_{\bar{x}} = (\vartheta_i - \vartheta_{i-1})/h$. Then from (1)-(3), we obtain the following Cauchy problem for a system of first-order ordinary differential equations:

$$D\frac{du_h}{dt} = f(u_h),\quad u_h(0) = u_{h,0}, \tag{4}$$

where $D = \Lambda - E$ is the linear constant operator that acts from $H_h \to H_h$,

$$\Lambda = \frac{1}{h^2}\begin{pmatrix} -2 & 1 & 0 & \dots & \dots & 0 \\ 1 & -2 & 1 & 0 & \dots & 0 \\ 0 & 1 & -2 & 1 & \dots & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & \dots & \dots & 1 & -2 & 1 \\ 0 & \dots & & 0 & 1 & -2 \end{pmatrix},\quad E = \begin{pmatrix} 1 & 0 & 0 & \dots & 0 \\ 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & \dots & 0 \\ \dots & \dots & \dots & \dots & \dots \\ 0 & \dots & \dots & 1 & 0 \\ 0 & \dots & & 0 & 1 \end{pmatrix}.$$

Here $D^* = D > 0$, $\forall\, t \ge 0$, $f(u_h) = -u_h^3 + f_h$, $u_h = u_h(t) \in H_h$, $f(u_h),\ f_h \in H_h$, $\Lambda u_h = u_{h,\bar{x}x}$, u_h is the value of the function at a fixed node $x = (ih)$, $u_{h,\bar{x}x} = [u_h((i+1)h) - 2u_h(ih) + u_h((i-1)h)]/h^2$, f_h approximates $f(x,t)$. The difference operator (matrix) D approximates the second-order differential operator $\Delta u - u$, i.e. $O(h^2)$. Here, operator D is non-degenerate, hence, there exists the inverse operator D^{-1}.

4. Time discretization. To discretize the time variable in (4), we use the first- and second-order Euler methods.

1° *Explicit Euler scheme*. We introduce the uniform time grid $\bar{\omega}_\tau = \{t_n = n\tau,\ n = 0,1,...\}$, $\tau > 0$. Let y be the grid function that approximates semi-discrete function u_h. From (4), we obtain the following difference scheme:

$$Dy_t = f(y),\ y(0) = u_0,\ n = 0,1,..., \tag{5}$$

where $y_t = (y_{n+1} - y_n)/\tau$, $y = y_n = y(t_n) \in \overset{\circ}{H}_h$.

As is known, scheme (5) has the first-order accuracy, i.e. $\left|y-u_h\right|=O(\tau)$. Let us rewrite it as the following difference equation:

$$y_{n+1}=S_n y_n+\tau D^{-1}f(y_n),\ y_0=u_{h,0},\ n=0,1,\ldots, \tag{6}$$

where $S_n\equiv E$.

We investigate the stability of scheme (5) or (6) based on the following difference equation:

$$y_{n+1}=S_n y_n+f_n(y_n),\ y_0=u_{h,0},\ n=0,1,\ldots \tag{7}$$

To do this, we use the results of [9], where the following theorems were proven.

Theorem 1. *Suppose that the following conditions are satisfied*

a) the trivial solution to equation

$$y_{n+1}=S_n y_n,\ y_0=u_{h,0},\ n=0,1,\ldots \tag{8}$$

is uniformly stable, i.e., $\forall j>0,\ j\le n$, *estimate* $\|y_n\|\le M_1\|y_j\|$ *holds,* $j=0,1,\ldots,n_0-1,\ 0\le n\le n_0$, *where* M_1 *- is the positive constant;*

b) the nonlinear right-hand side of equation (7) satisfies the following conditions:

$$\|f(y_n)\|=K_n\|y_n\|^r,\ r>1,\ f_n(0)=0,\ \sum_{m=0}^{n-1}K_m\le M_2<\infty,$$

where M_2 *is some positive constant. In this case, the trivial sequence* $y_n=0$ *is the solution to equation (8);*

c) the initial perturbation y_0 *is sufficiently small.*

Then the trivial solution of the equation (8) is stable, i.e., the following estimate holds:

$$\|y_n\|\le M\|y_0\|,\ \forall n=0,1,\ldots,$$

where M *– is the positive constant.*

Now consider the following difference equation:

$$y_{n+1}=S_n y_n+f_n(y_n)+g_n,\quad y_0=u_{h,0},\quad g_n(0)\ne 0,\quad n=0,1,\ldots \tag{9}$$

Theorem 2. *Let the conditions of Theorem 1 be satisfied. Furthermore, the constantly acting perturbation* g *satisfies the following condition:*

$$\sum_{m=0}^{n=1}\|g_m\|\le\delta_0,\ \forall m,\ \delta_0>0,$$

where δ_0 *- is sufficiently small. Then the trivial solution to equation (9) is stable under constantly acting disturbances, and the following estimate is valid for its solution:*

$$\|y_n\|\le M\left(\|y_0\|+\sum_{m=0}^{n=1}\|g_m\|\right). \tag{10}$$

Let us define the error of scheme (5) $z=y-u$ $(y=z+u)$, which satisfies the following equation:

$$Dz_t=f(y_n)-f(u_n)+g_n,\ g_n(0)\ne 0,\ n=0,1,\ldots,\ z_0=0, \tag{11}$$

where g_n is the approximation error, i.e., $g=O(\tau)$, as a constantly acting perturbation.

Using the Fréchet derivative for functional f, we obtain:

$$f(y)-f(u)=f(u+z)-f(u)=f'(u)z+O(z^2),$$

i.e., from (11) we have

$$Dz_t = f'(u)z_n + q(z_n) + g_n,\ z_0 = 0, \tag{12}$$

where $q(z_n) = O\left(\|z_n\|^r\right),\ r > 1,\ f'(u) = \partial f(u) / \partial u$. From (12), it follows that

$$z_{n+1} = S_n z_n + \tau D^{-1} q(z_n) + \tau D^{-1} g_n,\ z_0 = 0, \tag{13}$$

where $S_n = 1 + \tau D^{-1} f'(u)$.

By Theorem 2, the scheme (12) is stable if the solution to its first approximation $z_{n+1} = S_n z_n$ is uniformly stable, i.e., the condition for the uniform stability of the solution is condition $\|S_n\| \le M$ ($M = 1 + c_0\tau$, $n = 0,1,2,...,n_0 - 1$, $c_0 \ge 0$ is the constant independent of the grid steps [10]). If this condition is satisfied, we obtain the uniform stability estimate

$$\|z_{n+1}\| \le M \|z_j\|,\quad j = 0,1,...,n_0.$$

Since $F'(u)$ is a bounded linear functional, $\|1 + \tau D^{-1} f'(u)\| \le M$ holds, and the remaining conditions of Theorem 2 are satisfied.

Now we prove the convergence of the scheme. By assumption, that solution (8) is uniformly stable (the first condition of Theorem 1), we obtain from (13):

$$\|z_{n+1}\| \le \|S_n\|\|z_n\| + \tau\left\|D^{-1} q(z_n)\right\| + \tau\left\|D^{-1} g_n\right\|.$$

Hence

$$\|z_{n+1}\| \le M\left(\|z_0\| + \tau\left\|D^{-1}\right\|\sum_{m=0}^{n-1} K_m \|z_n\| + \tau\left\|D^{-1}\right\|\sum_{m=0}^{n-1}\|g_m\|\right),$$

i.e., by Theorem 2, the following estimate holds

$$\|z_{n+1}\| \le \tilde{M}\left(\|z_0\| + \tau\sum_{m=0}^{n-1}\|g_m\|\right). \tag{14}$$

Provided that $\|S_n\| \le 1$, for $M = 1$ we get the following stability conditions

$|1 + \tau D^{-1} f'(u)| \le 1$ or $-1 \le 1 + \tau D^{-1} f'(u) \le 1$, i.e.

a) $1 + \tau D^{-1} f'(u) \le 1$ is satisfied, since $f'(u) = -3u^2 \le 0$;

b) $-1 \le 1 + \tau D^{-1} f'(u)$, $\tau\left|\bar{D}^{-1} f'(u)\right| \le 2$, $\tau \le 2 / \left[\left\|D^{-1}\right\|\left|f'(u)\right|\right]$.

Since $\left\|D^{-1}\right\| \le h^2 / 4$, we obtain the uniform stability condition for scheme (5)

$$\tau \le h^2 / [2|f'(u)|]. \tag{15}$$

Thus, the following theorem is proven.

Theorem 3. *Let the uniform stability condition (15) hold. Then the solution of the explicit difference scheme (5) is stable with respect to the initial data and the right-hand side. In particular, it satisfies the a priori estimate (14) and converges to the solution of the original problem (1)–(3) with rate* $O(\tau + |h|^2)$.

2°. Implicit Euler scheme. We approximate problem (4) with the following implicit difference scheme

$$Dy_t = f(\hat{y}),\ \ y(0) = u_0,\ \ n = 0,1,..., \tag{16}$$

where $\hat{y} = y_{n+1}$. This scheme also has first-order accuracy, i.e. $|y - u_h| = O(\tau)$.

For the error, we obtain problem $(z = y - u,\ y = z + u)$:

$$Dz_t = f(\hat{y}) - f(\hat{u}) + g_n.$$

Using the Fréchet derivative, we have

$$Dz_t = f'(u)z_{n+1} + q(z_{n+1}) + g_n. \tag{17}$$

where $\|q(z_{n+1})\| = K_{n+1}\|z_{n+1}\|^r$, $r > 1 (n = 0,1,...)$, $f'(u)$ is the bounded linear operator (functional). To study the convergence of scheme (17), we obtain the following first-approximation equation:

$$z_{n+1} = S_n z_n,\ \ S_n = \left(1 - \tau D^{-1} f'(u)\right)^{-1}.$$

Let the solution to this equation be uniformly stable, i.e., $\|S_n\| \le 1$, i.e., then we have the uniform stability condition of solution $1/\left(1 - \tau D^{-1} f'(u)\right) \le 1$. This condition is always satisfied, since $f'(u) \le 0$. Therefore, based on Theorem 2, the following theorem holds.

Theorem 4. *The solution of the implicit difference scheme (16) is absolutely stable with respect to the initial data and the right-hand side. In particular, it satisfies the a priori estimate (14), and it converges to the solution of the original problem (1)–(3) with at a rate* $O(\tau + |h|^2)$.

The schemes considered have first-order accuracy with respect to the time variable. Therefore, we consider difference schemes of a higher order of accuracy, i.e., a modified Euler scheme of second-order accuracy.

3°. We approximate problem (4) with the following difference scheme (parameter $\sigma > 0$)

$$Dy_t = (1-\sigma) f(y_n) + \sigma f(y_n + \tau f(y_n)),\ \ y(0) = u_0,\ \ n = 0,1,.... \tag{18}$$

It is known [10] that the difference scheme (18) has second-order accuracy, i.e., $|y - u_h| = O(\tau^2)$ for $\sigma = 1/2$. From (18) for $\sigma = 0$, we obtain the explicit difference scheme (5) and for $\sigma = 1$, we obtain the implicit difference scheme (16), where $y_{n+1} = y_n + \tau f(y_n)$ is the explicit Euler scheme.

Let us study the stability of scheme (18). To do this, we write it in the following form:

$$y_t = F(y_n),\ \ y(0) = u_0,\ \ n = 0,1,..., \tag{19}$$

where $F(y_n) = (1-\sigma)D^{-1} f(y_n) + \sigma D^{-1} f(y_n + \tau f(y_n))$. Next, defining the errors using expression $z = y - u$ and, substituting $y = z + u$ into the difference scheme (19), we obtain the problem for the scheme error.

$$z_t = F(y_n) - F(u_n) + g_n,\ \ n = 0,1,2,...,\ \ z_0 = 0.$$

Using the Fréchet derivative for $F(y)$, we obtain

$$z_t = F'(u_n)z_n + q(z_n) + g_n,\ \ z_0 = 0, \tag{20}$$

where

$$F'(u) = (1-\sigma)D^{-1} f'(u) + \sigma D^{-1} f'(u + \tau f(u)) \cdot (1 + \tau f'(u)).$$

From (20), we obtain the first-approximation equations

$$z_{n+1} = S_n z_n,\ \ S_n = 1 + \tau D^{-1} \tilde{f}'(u_n),$$

where

$$\tilde{f}'(u) = (1-\sigma) f'(u) + \sigma f'(u + \tau f(u)) \cdot (1 + \tau f'(u)). \tag{21}$$

Let us check under what conditions the uniform stability condition $\|S_n\| \le 1$is satisfied, i.e. $\left\|1+\tau D^{-1}\tilde{f}'(u_n)\right\| \le 1$ or $-1 \le 1+\tau D^{-1}\tilde{f}'(u_n) \le 1$. Hence,

a) $1+\tau D^{-1}\tilde{f}'(u_n) \le 1$ if $\tilde{f}'(u) \le 0$. From (21), it follows that $\tilde{f}'(u) \le 0$, if

$$\tilde{f}'(u) = (1-\sigma)D^{-1}f'(u) + \sigma D^{-1}f'(u+\tau f(u))\cdot(1+\tau f'(u)) \le 0. \qquad (22)$$

Applying the Taylor expansion formula for $f'(u+\tau f(u))$, we obtain the condition for inequality (22) to be satisfied.

$$\tilde{f}'(u) = f'(u) + \sigma\tau f(u) f''(u) + \frac{\sigma\tau^2}{2} f^2(u) f'''(u) + \sigma\tau f'^2(u) +$$

$$+\sigma\tau^2 f(u) f'(u) f''(u) + \frac{\sigma\tau^3}{2} f^2(u) f'(u) f'''(u) \le 0. \qquad (23)$$

Direct verification of condition (23) for $f(u) = -u^3$ leads to the uniform stability condition for scheme (18) $\tilde{f}'(u) = -u^2 + 5\sigma\tau u^4 - 5\sigma\tau^2 u^6 - 3\sigma\tau^3 u^8 \le 0$, which is always satisfied due to the first term and the smallness of $\tau << 1$ ($\sigma > 0$).

b) $-1 \le 1+\tau D^{-1}\tilde{f}'(u)$, $\tau\left|D^{-1}\tilde{f}'(u)\right| \le 2$, $\tau \le 2 / \left[\left\|D^{-1}\right\|\left|\tilde{f}'(u)\right|\right]$. Considering $\left\|D^{-1}\right\| \le h^2/4$, we obtain the uniform stability condition for scheme (18).

$$\tau \le h^2 / \left[2\left|\tilde{f}'(u)\right|\right]. \qquad (24)$$

This proves the following theorem.

Theorem 5. *Let condition (24) be satisfied. Then the solution of the difference scheme (18) for $\sigma > 0$ is stable with respect to the initial data and the right-hand side, and it satisfies the a priori estimate (14). Moreover, this solution converges to the solution of the original problem (1)–(3) with the rate $O(\tau^2 + |h|^2)$.*

5. Conclusions. The nonlinear problem of quasi-stationary processes in semiconductors, characterized by a stationary distribution of free charge current sources, has been addressed using Euler methods. To discretize the problem, the method of lines was first employed, leading to a Cauchy problem consisting of a system of nonlinear ordinary differential equations. This system was subsequently solved using first- and second-order Euler methods. Drawing on the theory of difference equations outlined in [9], we have derived stability conditions for the difference schemes and established a priori convergence estimates. Theorems regarding the accuracy of the scheme are presented.

DIVERSITY AND DISTRIBUTION OF CURCULIONIDAE (COLEOPTERA) IN KARAKALPAKSTAN

Oteniyazov R.B.
Karakalpak State University named after Berdakh
Email: rasuloteniyazov86@gmail.com

Summary: *This article provides information on the ecological factors influencing the biodiversity and activity of weevils (Curculionidae), whose distribution and life cycles depend on various abiotic and biotic conditions. These factors determine the development, reproduction, migration, and population dynamics of weevils in arid regions. The ecosystems inhabited by weevils are affected by natural processes and anthropogenic impacts, including desertification. This study analyzes key ecological factors affecting weevil life, with a focus on pest and invasive species such as Megamecus viridans (Menetries, 1849) and Lixus incanescens (Faldermann, 1837). A list of taxa collected during long-term field research in Karakalpakstan is provided, along with bioecological descriptions of some rare and endemic species from the collection. High-quality descriptions of rare species, such as Ammocleonus quadrimaculatus (Motschulsky, 1860), are presented, including their habitats and host plants.*

INTRODUCTION

The family Curculionidae (weevils) comprises over 50,000 species worldwide, making it one of the largest in the order Coleoptera. These insects play vital roles in ecosystems as phytophages, contributing to plant decomposition and serving as prey for predators. However, many species are economically significant pests, damaging crops, forests, and desert vegetation, leading to substantial losses in agriculture and forestry. The ecology and biology of weevils, particularly their adaptations to temperature, humidity, and salinity, are crucial for understanding their distribution and activity in arid zones. In the Palaearctic region, weevils are diverse, with several species exhibiting limited ranges. In Uzbekistan, numerous weevil species have been recorded, holding both ecological and economic importance. Nevertheless, data on the biodiversity and ecology of Curculionidae in Karakalpakstan remain limited. This region, characterized by extreme climatic conditions—hot summers (+40°C) and cold winters (-20°C to -30°C)—offers a unique setting for studying insect adaptations to desertification and environmental stress. The aim of this study is to address knowledge gaps regarding the weevil fauna of Karakalpakstan, investigating the biology and ecology of key species in the region. Insect activity, development, and reproduction are directly influenced by external temperatures. Sudden temperature fluctuations can impact populations significantly; for instance, cold winters induce diapause, while high summer temperatures accelerate feeding and reproduction. Humidity is another critical factor, with desert-adapted species tolerating low moisture levels, unlike those in humid tugai forests. Currently, in Karakalpakstan, anthropogenic landscape transformations and climate changes are degrading plant flora, creating favorable conditions for phytophagous weevils. Widespread desert plants like *Haloxylon* spp., *Tamarix* spp., and *Ferula* assa-foetida serve as key hosts, playing essential roles in local ecosystems.

Historical entomological research in Central Asia, including the works of Yakhontov (1950), Alimjonov (1950), Bekuzin (1962), Shamuratov (1970), Toreniyozov (1969), Avanesova (1982), Davletshina (1984), Utepbergenov (1990), Khamrayev (2000), Bekbergenova (2000), Shamuratova (2007), Qulumbetova (2008), Medetov (2010), and Qoshonova (2010), has documented the diversity of Curculionidae; however, post-desiccation updates specific to Karakalpakstan remain limited. International studies by Tauber et al. (1986), Lachininsky et al. (1992), Basset (1994), Ram and Tchernyshev (1995), Showalter (2011), Brockerhoff and Liebhold (2017), as well as by CIS researchers such as Yanshin and Goldenberg (1960), Chinayev (1964), Stolyarov (1967), Sinadsky (1972), Bey-Bienko (1980), Bogach (1982), Iskakov (1983), Kasheyev (2002), Zamotailov (2009), Zakhvatkin et al. (2009), and Childebaev (2011), have provided a broad context for understanding entomofauna in arid zones.

EXPERIMENTAL RESEARCH

The research materials were collected from the desert and tugai areas of Karakalpakstan in 2025. Standard entomological methods were employed, including visual observations, sweeping nets, pitfall traps, and soil excavations for collecting weevils (e.g., *Megamecus viridans*, *Lixus incanescens*, *Ammocleonus quadrimaculatus*).

1. In our studies, we used the Barber method of soil traps [1] to catch beetles. Glass containers with a diameter of 72–73 mm and a capacity of 0.5 liters and 0.25 liters (55 mm diameter) were used as traps, which were dug level with the soil surface. In each biotope, 10 traps were typically placed in a row, 10 meters apart. In some experiments, between 20 and 70 traps were used. Ethyl acetate solution was employed as the fixation liquid. The traps were often used for faunal collection.
2. In our research, we mainly used the light trap method described by N.L. Sakharova [2]

Specimens were photographed using a Canon PowerShot A640 camera and MicroMed MC-2-ZOOM microscope, with images edited in Adobe Photoshop 7.0. Species identification relied on international catalogs such as "Catalogue of Palaearctic Coleoptera" [6] and scientific references therein. A map of surveyed regions in Karakalpakstan was included (Figure 1), with symbols indicating collection sites, habitat types, and trap locations for visual context.

Figure 3. Map of surveyed areas in Karakalpakstan, showing trap sites, habitats, and collection points.

FIGURE 1. Territories where the scientific researches are held. A) The Lower Amudarya State Biosphere Reserve; B) The Sudochje-Akpetki State Reserve;

RESEARCH RESULTS

Weevil (Curculionidae) distribution and development are strongly influenced by environmental factors such as host plant availability, temperature, humidity, and soil salinity [1–3]. Anthropogenic impacts, including pesticide application and habitat modification, contribute to reductions in biodiversity and population abundance [4,5].

Megamecus viridans (Menetries, 1849)

Records from the Southern Aral region and Kyzylkum desert in Karakalpakstan indicate active spread of *Megamecus viridans*. Adults are typically observed on the flowers of *Glycyrrhiza glabra* and *Haloxylon* spp. during the May–June flowering period.

- Geographic distribution: Central Asia (Afghanistan, Iran, Kazakhstan, Uzbekistan)
- Host plants: *Glycyrrhiza glabra*, *Haloxylon* spp.
- Feeding habits: Larvae develop on roots and rhizomes of Apiaceae and Chenopodiaceae; adults feed on stems.
- Life cycle: 1–2 years; pupation occurs in soil cocoons.
- Adult activity: April–July; crepuscular or nocturnal, attracted to light
- Body length: 10–15 mm
- Collection records:
  - The Sudochje-Akpetki State Reserve; (2025): 5♂, 3♀ on *Glycyrrhiza*
  - Kyzylkum desert (2025): 2♂, 4♀ on *Haloxylon*

Lixus incanescens (Faldermann, 1837)

Lixus incanescens has a wide distribution from Europe to Central Asia, occurring in both tugai forests and desert ecosystems.

- Larval development: Occurs in stems and roots of dying herbaceous plants; galleries are irregular beneath bark and may penetrate wood for pupation.
- Adult activity: May–September, feeding on host plants or nearby felled vegetation.
- Records in Karakalpakstan: Taxtakopir district and Southern Aral regions (e.g., 42.5°N, 60.3°E); found alongside species such as *Ammocleonus quadrimaculatus* on *Tamarix* and *Haloxylon*.

Ammocleonus quadrimaculatus (Motschulsky, 1860)

Ammocleonus quadrimaculatus is polyphagous, feeding on at least ten plant species. Young plants with thin roots are particularly susceptible.

- Larval feeding: Larvae girdle roots, often leading to plant death [2].
- Control measures: Insecticides, e.g., imidacloprid, are applied in affected areas.
- Adult emergence: April–May at ~20°C; active in evenings, hide during daytime
- Reproduction: Females lay 200–250 eggs over ~2 months
- Larval development: 9–17 days; tunnels extend ~25 cm
- Pupation: Occurs in soil chambers
- Life cycle: Approximately 2 years

CONCLUSIONS

The study shows that populations of Megamecus viridans and Lixus incanescens in Karakalpakstan are tied to host plants like Glycyrrhiza glabra and Haloxylon spp., with peak activity during blooming in May–June. These align with prior research on weevil feeding (Zhuginisov T, 2023). Temperature and humidity influence activity, with higher temperatures boosting reproduction, but climate changes pose risks. Pesticides (e.g., imidacloprid) reduce pest numbers on trees, offering control options. However, long-term effects on biodiversity need further study.

Tadqiqot 2025 yilda o‘tkazilgan bo‘lib, an’anaviy entomologik usullar, masalan, tuproq va yorug‘lik tuzoqlari qo‘llanilgan. Aniqlangan turlar Qoraqalpoqistonning Janubiy Orolbo‘yi va Kizilqum cho‘llarida, ayniqsa Glycyrrhiza glabra va Haloxylon spp. o‘simliklarida topilgan. Tadqiqot ekologik omillar, masalan, harorat, namlik va oziq-ovqat manbalari turlarining tarqalishi va ko‘payishiga ta’sirini ko‘rsatdi. Shuningdek, inson faoliyati, jumladan pestitsidlar ishlatilishi, hasharot populyatsiyalari va yashash joylariga ta’siri o‘rganildi. Qoraqalpoqistonda filcha qo‘ng‘izlar haqidagi ma’lumotlar yetarli emasligiga qaramay, ushbu tadqiqot turlarning tarqalishi va ekologik afzalliklarini o‘rganishda muhim ma’lumotlarni taqdim etdi. Asosiy natijalar ekologik omillarning hasharot populyatsiyalarini shakllantirishdagi ahamiyatini ko‘rsatdi va Qoraqalpoqistonda bioxilma-xillikni saqlash zarurligini ta’kidlaydi.*

Резюме*: Это исследование посвящено экологическим и биологическим особенностям жуков-долгоносиков (Curculionidae) в Каракалпакстане, с акцентом на виды Megamecus viridans (Menetries, 1849) и Lixus incanescens (Faldermann, 1837). Исследование проводилось в 2025 год с использованием традиционных энтомологических методов, таких как почвенные и световые ловушки. Выявленные виды найдены в Южно-Приаралье и пустыне Кызылкум Каракалпакстана, особенно на растениях Glycyrrhiza glabra и Haloxylon spp. Работа рассматривает роль экологических факторов, таких как температура, влажность и источники пищи, в распространении и размножении видов. Также изучено влияние человеческой деятельности, включая использование пестицидов, на популяции насекомых и их среды обитания. Несмотря на недостаток данных о жуках-долгоносиках в Каракалпакстане, это исследование предоставляет важную информацию о распространении видов и их экологических предпочтениях. Основные результаты подчеркивают важность экологических факторов для формирования популяций насекомых и необходимость их учета для сохранения биоразнообразия в Каракалпакстане.*

Kalit so‘zlar*: Qoraqalpoqiston, filcha qo‘ng‘izlar, Megamecus viridans, Lixus incanescens, Glycyrrhiza glabra, ekologik omillar, entomologik tadqiqotlar, pestitsidlar, bioxilma-xillikni saqlash.*

AGRICULTURAL TECHNOLOGY FOR CULTIVATION OF THE PLANT *PLANTAGO MAJOR* L

Abdiniyazova G.J., Baxieva L.A.
Karakalpak State University named after Berdakh

Summary: *This article provides information on the agricultural technology, chemical composition, applications, distribution, and raw material processing of* Plantago major *L. Studies include seed germination experiments conducted under laboratory conditions (water-soaked and control variants) as well as field experiments.*

Key words: *Karakalpakstan, medicinal plants,* Plantaginaceae *Juss. family, life form, folk medicine, agricultural technology*

INTRODUCTION

Plantago major L. is a perennial herbaceous plant belonging to the *Plantaginaceae* Juss. family. It is characterized by a large, thick rhizome and is a stemless perennial herb. The above-ground portion consists of basal leaves and a flower spike 10-50 cm in height [1].

The leaves are long-petiolate, winged, broadly ovate or broadly elliptical, with 3-9 prominent parallel veins [1]. One or several flower spikes emerge from the plant. The small, inconspicuous, four-lobed flowers are arranged in a spike-like inflorescence at the apex of the flowering stem. The fruit is an ovoid, many-seeded capsule. The plant flowers and fruits mature during June-September. The stem is erect and branched, reaching 30-60 (80) cm in height [4]. The lower leaves have petiole sheaths, dry out early, and fall off. The middle and upper stem leaves are linear, entire-margined, and sessile. The flower heads are large and solitary at the ends of stems and branches. The marginal flowers of the head are light blue (rarely white or light pink), obliquely funnel-shaped, and sterile; the central flowers are tubular, blue-violet, and bisexual (Figure 1).

MATERIALS AND METHODS

The fruit is gray or yellowish gray with sparse hairs at the seed apex. Each plant produces up to 2,500 seeds. It blooms in June-July, with fruits ripening in August-September. Reproduction occurs exclusively by seed. The leaves of *P. major* are the primary medicinal raw material. Seeds are 12-15 mm long and 5-9 mm wide, slightly pubescent with a cobweb-like appearance. The lower and middle leaves are triangular, silvery-white or blackish brown in color, with short margins. The flower corolla is blue violet, with margins that are blue or purple, and in some cases light red or white. The marginal flowers are ovoid. Seeds are elliptical-oval, 3-4.5 mm long and 1.5-1.8 mm wide (Figure 2). The pappus is multi-rowed, 3-3.5 mm long, with inner hairs three times shorter than the outer ones, consisting of narrow bristles.

Figure 1. Flowers of *Plantago major* L.

Figure 2. Seeds of *Plantago major* L.

The 1000-seed weight of ***P. major*** is 1.0-1.7 g. According to State Pharmacopoeia requirements, dried ***P. major*** leaves should be ovate or elliptical with entire margins, bearing 5-9 parallel veins, up to 12 cm long and 8 cm wide, with short petioles. Moisture content should be 14%, yellowed and blackened leaves should not exceed 5%, flower stalks should not exceed 1%, organic and mineral impurities should be 1%, total ash content should not exceed 20%, and extractive substance content should be at least 30%. The moisture content of fresh plant leaves should be at least 70%.

Experimental Design

Laboratory Experiments

In our laboratory experiments, we first determined the germination rate of *P.major* seeds (Table 1). Experiments were initiated on March 27, 2024, and field experiments were conducted on April 23, 2024, at the experimental site in the Biology Faculty area (Table 2). The procedure was as follows:

- Seeds of *P. major* (collected in 2024) were counted.

- Four Petri dishes were thoroughly cleaned for the experiment, labeled, and prepared. Filter papers were placed in the Petri dishes, seeds were distributed, and 3-5 ml of water was added. Care was taken to avoid excess water. Seed germination was monitored and recorded. The dishes were kept moist throughout the experiment.

Seed germination of *P. major* was monitored at different temperatures. Forty seeds were counted in Petri dishes for each treatment, with four replicates (Table 1). Seeds were tested under two conditions: (1) untreated control and (2) water-soaked.

Table-1

Germination of Plantago major L. seeds under laboratory conditions (2024)

№	Treatment	Number of seeds	plant germination %		
			Sowing date	Germinated seeds	Germinatio%
1	Control (untreated)	40	27.03.2024	25	62,5 %
2	Water-soaked	40	27.03.2024	31	77,5 %

The experimental field was plowed on April 30, 2024, to a depth of 25-30 cm using specialized equipment. On May 6, 2024, the field was prepared for seed sowing. On May 9, 2024, seeds were sown with row spacing of 60-70 cm and plant spacing of 20-30 cm. Sowing depth was 1.0-1.5 cm.

The germination of *P.major* seeds was studied under various field conditions. Seeds sown in the experimental field at the Biology Faculty on April 23, 2024, germinated on May 16, 2024. Budding occurred on June 21, 2024, flowering on July 3, 2024, and fruiting on July 23, 2024.

A separate planting was established on May 1, 2024, to study cultivation in a front yard location, with germination occurring five days later. Budding occurred on July 18, 2024, flowering on June 26, 2024, and fruiting on July 30, 2024. The total vegetation period for *P. major* was approximately 85-90 days (Table-2).

Table-2

Germination of *Plantago major* L. seeds under different field conditions (2025)

	Sowing date	Germination date	Budding date	Flowering date	Fruiting date	Vegetation period (days)
Experimental area at Biology Faculty	23.04	15.05	21.06	3.07	23.07	85
Front yard	01.05	06.05	18.07	26.06	30.07	90

Medicinal preparations of *P.major* (infusions, preserved juice from freshly harvested leaves or aerial parts, and plantaglucid preparations) are used to treat gastrointestinal diseases including gastritis, enteritis, enterocolitis, colitis, and gastric and duodenal ulcers. Additionally, they are beneficial in cases of reduced gastric acid secretion. The juice extracted from leaves or aerial parts is used to treat colitis and wounds that are difficult to heal.

Seeds are sown using a seed drill with 60 cm row spacing. Sowing depth is 0.5-1.0 cm. Approximately 5-6 kg of seeds are required per hectare. Prior to sowing, seeds are thoroughly washed to remove the mucilaginous layer and dried.

To ensure even distribution, 1 kg of seeds is mixed with 10 kg of sand, powdered manure, or similar material. Seeds can also be sown in autumn, in which case they are first stratified to accelerate germination.

P.major requires 10-12 irrigations during the growing season, 3-4 cultivations, and fertilization with 30 kg nitrogen, 40 kg phosphorus, and 20 kg potassium per hectare during May-July.

In the second and subsequent years, in May, plants in two rows spaced 10 cm apart are thinned to maintain optimal density of 8-10 plants per linear meter. The field is irrigated 10-12 times during

the season, cultivated 3-4 times, and fertilized with 30 kg nitrogen, 40 kg phosphorus, and 20 kg potassium per hectare during May-July.

From the second year onward, 6-7 centners (600-700 kg) of dried leaves can be harvested from plantings of *P.major*. The plantation can be harvested for 3-4 years. Over the productive lifespan, 1.5-2 tons of dried leaves can be obtained per hectare.

The average 1000-seed weight of *P.major* is 1.0-1.7 g. Seeds are small and brown. In our 2024 experiments, the sowing date of March 25 showed good performance [2].

A decoction prepared from the leaves or fresh leaf juice has been used in folk medicine to treat respiratory tract diseases, eye diseases, skin conditions, malaria, colitis, and various infectious diseases, including anthrax. *P. major* leaves are also used in treating lung and stomach cancer and as an expectorant in respiratory diseases. Freshly picked leaves are crushed and applied to wounds, cuts, and abrasions. A decoction of seeds or seeds roasted with sugar is used to treat coughs, fevers, and other ailments. Freshly picked leaves crushed and mixed with equal amounts of sugar and kept in a warm place for three weeks yield a juice that is administered at 3-4 teaspoons per day to treat lung and stomach cancer [2,3].

The leaves of *P. major* contain xanthone glucoside, aucubin, alkaloids, tannins, mucilaginous substances, vitamin K, and uronic acids. Seeds contain steroid saponins, 44% mucilaginous substances, 22% fat, 0.16-0.17% pentosans, 22% protein, and 16% various amino acids. Both leaves and seeds contain vitamins C and K, carotene, and mucilage-forming substances. The roots contain up to 4% anthracene derivatives (anthraglycosides, chrysophanol, and emodin), 8-15% tannins, flavonoids, 0.19-0.95% essential oil, resins, vitamin K, mucilage, and other compounds. The fruit contains 0.73-0.83% anthracene compounds, 4.18-5.36% tannins, 123.1 mg % vitamin C, 2.86-2.91% mucilage, and resins. The leaves and stems contain 1.5-1.58% anthracene compounds, up to 98.9 mg% vitamin C, and resins [4].

THERMOCHEMICAL ACTIVATION AND SORPTION PROPERTIES OF SORGHUM STALK

[1]Abdurakhmonov E.B., [2]Djumanova Z.K.
[1]Termez State Pedagogical University
[2]Karakalpak state university named after Berdakh

Summary. *In the woodworking industry, lignin materials are disposed of into waste, a large amount of hydrolyzed lignin accumulates in landfills. Their processing by various thermal methods will allo.w, under certain conditions, to obtain high-quality adsorbents - activated carbon. The information given in this article is explained by the fact that it allows to obtain adsorbents with high structure parameters and high adsorption properties.*

Key words: *activated carbon, lignin, corn stalk, iodine, methyl blue, adsorption.*

INTRODUCTION. Currently, consumers are experiencing a shortage of high-quality activated carbons with high adsorption capacity. Review [1] examines the structure of activated carbon consumption. According to him, the main consumers of carbon adsorbents are food production (42%), technological use (38%), environmental protection (10%). It also explores the fields of using activated carbons, with particular attention to depyrogenation of solutions and water purification, chemical synthesis, gold and a number of other precious metals extraction processes, etc. [2].

Both granular and powdered activated carbon are suitable for cleaning liquids. Mostly continuous processes are carried out in granular AC and powdered AC is more suitable for working with batch processes. In order to ensure better contact of the cleaned medium with the coal, the process is often carried out with intensive mixing. The simplest method of separating the adsorbent from the liquid phase is precipitation, but it is rarely used due to the duration of the precipitation. Often, this method is used to purify wine and other alcoholic products [3]. Because of these difficulties, filtering is often used. The technologies of using powdered activated carbons are very diverse and allow to solve certain problems. For example, when cleaning wines, only powdered carbon dioxide is used, because in this case it is necessary to avoid short-term contact of the product with a large amount of coal. In many chemical industry processes, substances are recrystallized after filtration by treatment with activated carbon to obtain a pure crystalline end product.

Although the devices commonly used for solvent recovery are of standard design that provide approximately the same gas treatment efficiency, the devices used to treat air and gas without recovery of absorbed substances are quite different. Depending on the volume of air and the type of impurity, usually cylindrical filters with constant or open charge, as well as cassette filters of various shapes are used [4].

Sulfur dioxide emissions exceed all other toxic gases that pollute the atmosphere. It is formed by the combustion of sulfur, hydrogen sulfide, as well as by heating various sulfates in a stream of air or oxygen. Sulfur in fuels and ores turns into an aggressive gas when burned or oxidized. Pre-desulfurization of fuels (such as high-sulfur coal) and ores cannot completely eliminate sulfur dioxide emissions to the atmosphere. Thermal power plants are the main source of air pollution with sulfur dioxide. The concentration of SO_2 in the exhaust gases of thermal power plants mainly depends on the sulfur content of the fuel.

In the production of activated carbon, the starting material is first subjected to heat treatment in the absence of air, as a result of which volatile substances (moisture and partial resins) are removed from it. Carbonized materials are characterized by the reduction of oxygen and hydrogen [5]. The structure of the obtained raw coal is large-porous; and it cannot be used directly as an industrial adsorbent. The problem of obtaining an open work microporous structure during the activation process is solved. Activation is carried out by two main methods: oxidation with gas or steam or treatment with chemical reagents [6].

Activated carbon technologies implemented in industrial practice are mainly based on the use of steam-gas and chemical activation methods of various carbon materials [4].

It is necessary to study thermodynamic processes in microporous adsorbents at the molecular level. The authors conducted research on several types of micropores and studied their complete thermodynamic properties [7-12].

RESEARCH METHODOLOGY. Washing - the process of washing coal from soda products formed during pyrolysis. In preliminary studies, the most complete extraction of soda water was achieved by boiling the charcoal three times for half an hour (each time with a fresh portion of distilled water). The filtrates of the washings were combined and analyzed. At the end of the washings, the coal was treated with 0.5 n hydrochloric acid solution to reduce the ash content. After acid washing, the filter residue is washed with distilled water. The completion of acid washing of coal was monitored using universal indicator paper.

The existing technology for the production of carbon adsorbents using thermochemical activation methods made it possible to determine that, along with sulfate and carbonate, sodium hydroxide also has a certain effect on the formation of adsorptive properties. Its positive effect on the production of activated carbon from various carbon materials can be considered proven. Below are experimental data describing the activation properties of sodium hydroxide in connection with thermal processing of hydrolignin, as well as the possibility of using the obtained adsorbents for the production of high-power supercapacitors.

Discussion. The lignin was subjected to vibration grinding to ensure good contact of the carbon material particles with the activator. For this purpose, it was crushed in a vibrating mill and a lignin suspension was prepared in a 42% sodium hydroxide solution. The resulting mass was evaporated and dried in an oven at 103 °C, after which it was heat treated at temperatures of 500, 550 and 600 °C. Experimental data describing the productivity and adsorption properties of coal washed with hot water from sodium compounds are presented in Table 1.

From the experimental data of Table 1 follows. only at doses of 300% alkali compared to a.s. lignin forms a porous structure that allows iodine, MG, and heptane to be adsorbed in amounts that significantly exceed those of industrially produced powdered AC. The high efficiency of coal is noteworthy, it is 3 times higher for the steam-gas activation option. In the range of 500 - 600 ° C, the positive effect of temperature is weakly observed.

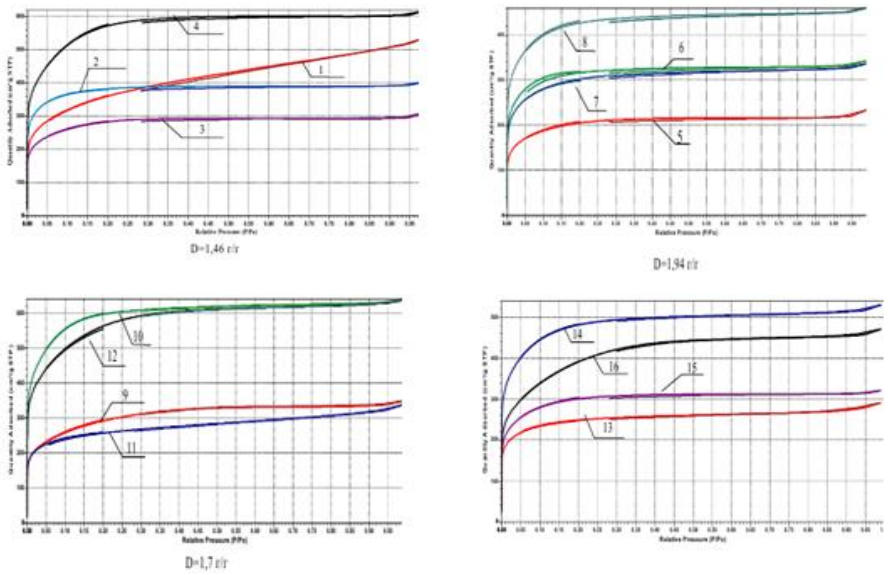
At the same time, for the practical implementation of such a process, the initial lignin should be dried to a moisture content of 18-20% and crushed in a vibrating mill.

Table 1 – Release and adsorption properties of activated carbon from vibration grinding lignin

№	D, r/r	Temperature TXA, ^{0}C	Coal output GL, %	Adsorption		
				Iodine, мг/г	MG, mg/g	Hepten, mg/g
1	1.8	500	55,31	320	75,4	304,7
2	1.8	600	53,37	335	74,9	327,6
3	1.8	700	53,95	305	72,6	304,2
4	2.4	500	53,14	4012	77,8	220,4
5	2.4	600	52,65	418	69,7	248,9
6	2.4	700	46,59	425	69,8	238,8
7	3.1	500	47,60	965	548,7	528,4
8	3.1	600	39,54	1074	539,7	553,9
9	3.1	700	37,32	1121	560,7	573,5

Taking into account the imperfection of the vibration grinding process and its inherent disadvantages, a comparative experiment of chemical activation of vibrating lignin with sodium hydroxide and original lignin without grinding was conducted. In the second case, lignin was divided into 5 fractions by particle size: 0-1 mm, 1-2 mm, 2-3 mm, 3-5 mm and more than 5 mm. All fractions made it possible to obtain an adsorbent with the same yield and the same properties. Table 2 therefore presents comparative data obtained with vibro-milled lignin and original unfractionated GL. The dose of alkali was 300%, and the heat treatment temperature was 600 °C.

Table 2 – Effect of sorghum extract and activated carbon on yield and properties



№	Lignin	Washed coal output,%	Adsorption	
			Iodine	MG
1	Extract residue	35.4	1222	581
2	Original plant	27.4	1145	588

Table 2 shows that the effect of grinding affects the yield of coal, but not the sorption properties. In addition, in the absence of grinding, the yield is significantly reduced: from 38.4 to 26.2%. At the same time, eliminating the need to use a GL vibration grinding step in practical implementation of the process makes it even more advantageous.

At the end of preliminary studies with vibratory grinding and the original unfractionated GL, four experiments were conducted that differed in the method of moisture removal from the reaction mass after the treatment of lignin with an aqueous alkali solution. In one case, both alkali-treated lignins were pre-dried in an oven, and in the second case, crude GL with NaOH was immediately placed in an oven heated to 600°C. The obtained experimental data show that the method of removing moisture from the reaction mass does not affect the yield and sorption properties of AC. In both cases, they remain at the levels presented in Table 2 for vibro-milled and original lignin.

In order to analyze the influence of the operating parameters of the AC synthesis on the formation of their porous structure, the planned experimental samples with a high dose of NaOH were used.

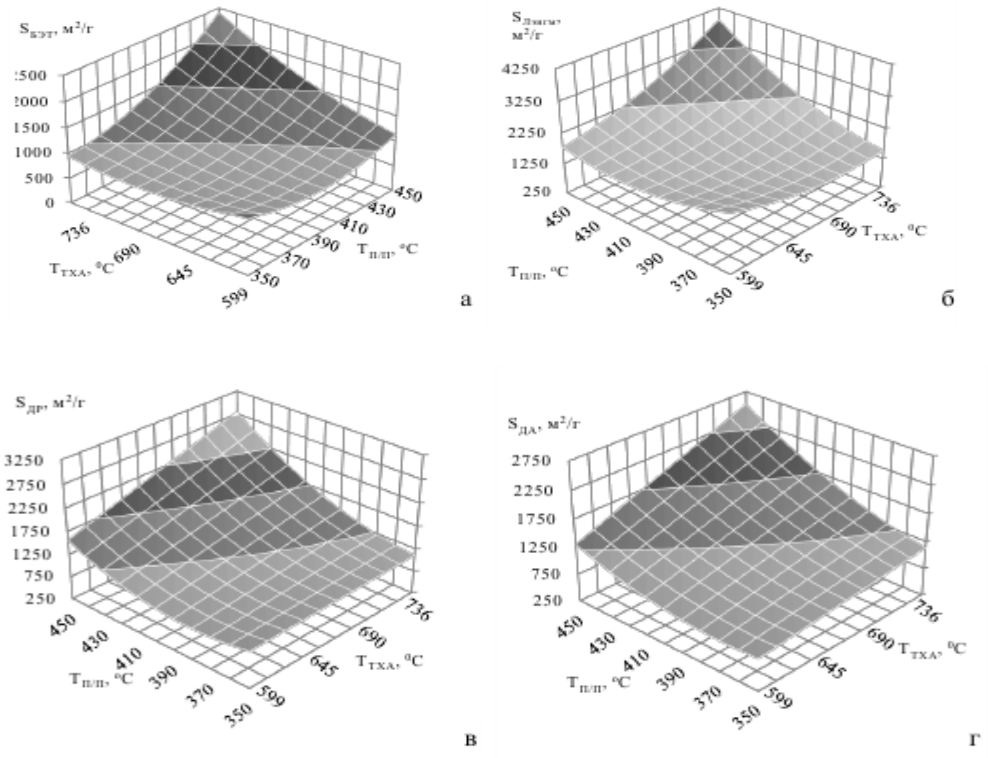
Nitrogen adsorption-desorption isotherms obtained for activated carbon samples under different conditions of thermochemical activation are presented in Figure 1 (the numbering of the curves corresponds to the experimental numbers in the table in Appendix B).

ТП/П=400 оС; ТТХА=675 оС

Figure 1. - Nitrogen adsorption - desorption isotherms

It can be seen from them that the porous structure is mainly represented by micropores (relative pressure up to 0.16). Mesopores are present in small amounts. In order to clarify the questions regarding the formation of the porous structure, these isotherms were processed using the BET equation, Langmuir equation, Dubinin-Radushkevich and Dubinin-Astakhov equations, as well as the t-line in the range of 0.05-0.35 relative pressure. equation (specific surface area of micropores), the size and dimensions of micropores in the studied materials were estimated by Horvat-Kawazoe, BET and Dubinin-Astakhov methods.

All adsorption isotherms obtained for the series samples are typical of type I according to the YuPAK classification, characteristic of microporous solids with predominant slotted pores, developed microporous system, and relatively small volume of pores of other sizes.



A summary table describing the values of the output parameters for these calculation methods is presented in Appendix B. They were used to calculate the coefficients of the regression equations connecting the obtained experimental data with the conditions of the experiments.

Analyzing the presented relationships, it becomes clear that their character is similar for all porosity parameters, except for the surface area using the t-plot method.

However, calculations using the Langmuir equation show clearly overestimated results, since adsorption using this method is assumed to occur via a monomolecular mechanism. This means that the adsorbed nitrogen, including the micropores, decomposes into a homogeneous surface in the form of a monolayer when it is filled in volume.

Calculation results using the Dubinin-Radushkevich and Dubinin-Astakhov equations turned out to be very close to the results obtained using the BET method. However, taking into account that in world practice, only the BET equation is used to describe the specific surface area according to the results of low-temperature nitrogen adsorption, we used this specific method in the following analysis.

To analyze the specific surface area determined by micro- and mesopores, we used the t-plot method, which, in our opinion, allows the most accurate assessment of the surface of these pores individually, if we take the total specific surface. area is determined by BET. The sum of Smi and Sme on the T-plot quantifies the specific surface area by BET. As can be seen from Figure 2, the total specific surface area of micropores is best generated under the conditions of the highest pyrolysis and thermochemical activation temperatures. In addition, the positive effect of prepyrolysis and TCA temperature mainly manifests itself at high temperatures of both factors.

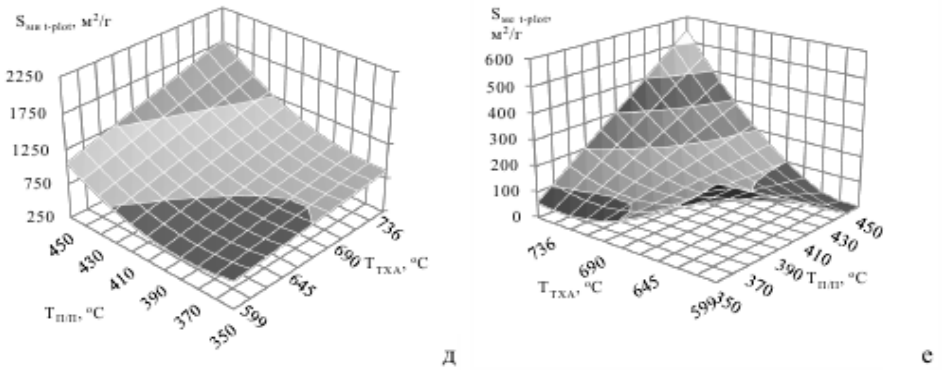


Figure 2. – **The effect of operating parameters on the formation of the specific surface of alternating current according to the indicator:**

a) specific surface according to BET, m^2/g; b) Langmuir specific surface area, m^2/g; c) specific surface according to Dubinin-Radushkevich, m^2/g; d) specific surface area according to Dubinin-Astakhov, m^2/g e) specific surface area using the t-plot method (micropores), m^2/g; e) specific surface of mesopores, m^2/g

The effect of the alkali dose on the specific surface of the samples is not visible, that is, it can be reduced without disturbing the parameters of the porous structure. As can be seen from Figure 2(e), the total specific surface area increases under the above conditions due to mesopores. As the prepyrolysis temperature increases from 350°C to 450°C at the maximum TCA temperature, the mesopore area increases from 50 to 550 m^2/g. Similarly, when the TCA temperature increases from 600 to 735°C, the surface area of mesopores increases more than 10 times. It can be seen from the regression equation, which is essentially a mathematical model of the process, that the alkali consumption under the experimental conditions has a very important effect on the formation of the specific surface of the mesopores. Analysis of coefficients for two-way interactions shows that the strongest and more positive effect of alkali on the value of the mesopore surface appears again at higher temperatures before pyrolysis and chemical activation. This is confirmed by both the sign of these coefficients and their absolute value. Naturally, the specific surface area of AC depends on the size of sorption pores, especially the size of micropores.

Summary. Using modern experimental methods, the effect of operational parameters on the value of the coefficients in the Freundlich and Langmuir equations during adsorption from methylene blue and iodine solutions was determined, which allows to predict their adsorption properties. Based on the data on low-temperature nitrogen adsorption, it was experimentally determined that the specific surface area of carbon adsorbents obtained from hydrolytic lignin under optimal synthesis conditions reaches 1600 m^2 BET and the pore structure is represented by 90% supermicropores.

STUDY OF THE MINEROLOGICAL COMPOSITION OF A COMPLEX FERTILIZER PREPARED FROM LOW-GRADE CENTRAL KYZYLKUM PHOSPHORITES.

Kazakhbaev S.A.
Karakalpak State University named after Berdakh

Summary: *The work studied the mineralogical composition of complex fertilizers obtained from low-grade phosphorites using modern physicochemical analysis methods. It was established that the obtained fertilizers consist of calcium nitrate, calcium dihydroorthophosphate, ammonium sulfate, and ammonium nitrate.*

Key words: *Nitrophosphate fertilizer; Low-grade phosphorite; Nitric acid decomposition; Sulfuric acid treatment; Hygroscopicity; Calcium nitrate; Calcium dihydroorthophosphate; Ammonium nitrate; Ammonium sulfate; Fluorocarbonate apatite.*

Phosphorite was decomposed with nitric acid at a stechometric norm of 45% relative to CaO, ammoniated to pH-3, and steamed to a density of 1.80 g/cm^3. The resulting melt was poured onto the horizontal surface and after hardening by crushing, irregularly shaped granules were obtained, resulting in their cross-sectional diameter being calculated approximately (1-2 мм) [1-2].

The surface of the NKFU granules was sprayed with 93% sulfuric acid in amounts of 8, 16, and 33% of the total mass. The resulting mass was neutralized with gaseous ammonia. Chemical analysis data showed that 60-80% of the total sulfuric acid content is present on the NKFU surface in the form $(NH_4)_2SO_4$ Thus, it has been established that when treated with sulfuric acid, the hygroscopicity class of NKFU transitions from very highly hygroscopic to highly hygroscopic[3-6].

Table 1

Dependence of the hygroscopic point of fertilizers on the sulfuric acid norm

Sample number	Sulfuric acid norm,%	Hygroscopic point,%
1.	NKFU+ 0	32.
2.	NKFU + 16%	35.
3.	NKFU + 33%	55.

As can be seen from the table. As the amount of sulfuric acid applied to the nitrogen-containing fertilizer increases, the hygroscopic point increases. Fertilizer without sulfuric acid treatment has a 32% hygroscopic point. Increasing the sulfuric acid content to 16 and 33% led to an increase in the hygroscopic point to 35 and 55%, respectively. Without treating the fertilizer with sulfuric acid, the hygroscopic point was too small, i.e., the resulting fertilizer can clearly be classified as very highly hygroscopic. From the data presented in Table 1, it follows that at all ratios of ammoniated nitric acid mixture: sulfuric acid, the hygroscopic point of fertilizers increases almost the same with an increase in the acid norm. This work examines the mineralogical composition of the obtained fertilizers using modern analysis methods [3-14].

The thermal analysis of the sample of the substance - 100-200 mg - was carried out on a Paulik-Paulik-Erdey derivatograph with a heating rate of 10-12 deg/min, in the temperature range of 20-10000C. The recording was carried out under atmospheric conditions with constant removal of gas using a water jet pump. A 7mm diameter platinum crucible served as the holder. Heated aluminum oxide was used as a standard [7-8].

The identification of the solid phase was carried out by methods of physicochemical analysis. The X-ray diffraction patterns of the studied compounds were taken on a Dron-2.0 diffractometer with filtered copper radiation at a voltage of 40kV, current strength of -20mA, and a speed of the counter of -2 deg/min. The values of the interplanar distances were determined from the reference book according to the reflection angle [9-10], and the intensity of the diffraction lines was determined from the stobalized scale. IR spectroscopic analysis was carried out to clarify the nature of interaction between the constituent components of the studied compounds with the registration of data on a

Specord IR-75 spectrophotometer in the 4000-400cm^{-1} frequency region. Samples were prepared by pressing with KBr, as well as by grinding in vaseline oil [12-14].

The approximate composition of the nitrogen-phosphorus fertilizer was determined by X-ray phase, thermogravimetric, and IR spectroscopic analysis methods. Nitrophosphorus fertilizers treated with sulfuric acid and without treatment differ little in the content of the main nutrient components.

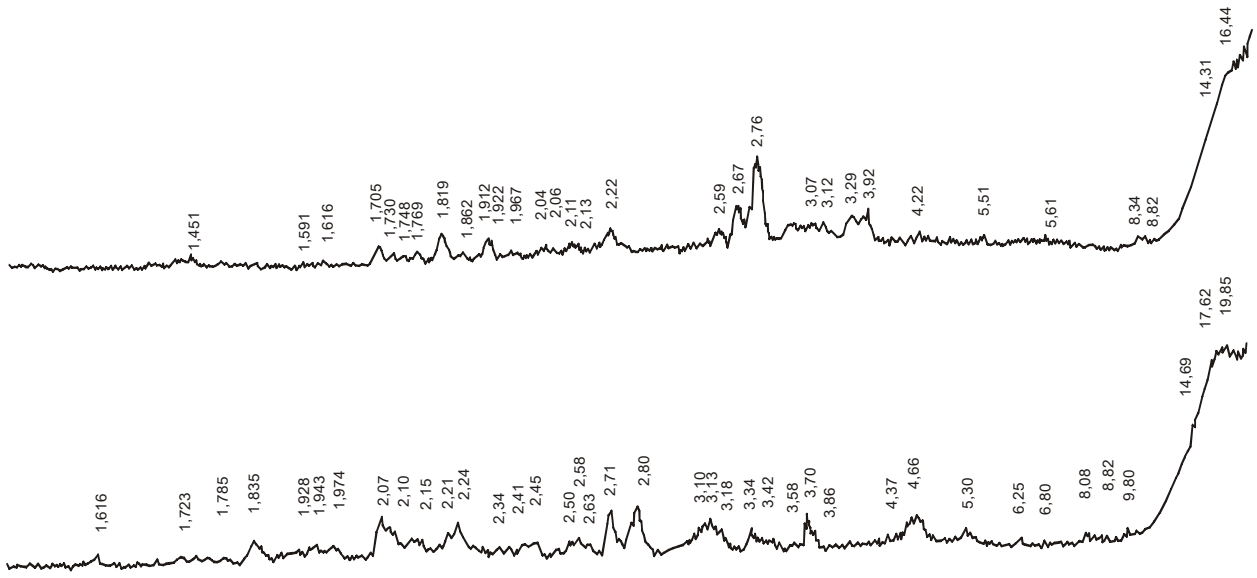

Figure 1 Radiographs of nitrogen-phosphorus fertilizers obtained:
1. By decomposition with nitric acid without treatment with sulfuric acid;
2. Decomposition by nitric acid with treatment with sulfuric acid

As can be seen from Figure 1, diffraction peaks of 2.76; 2.65, 1.83 A^{o,} which can be attributed to fluorocarbonapatite. The 2.27 A^{o} band is characteristic of calcite. This indicates that during the decomposition of Kyzylkum phosphorites with an incomplete norm of nitric acid, undecomposed phosphorites remain in the obtained fertilizers. In the diffractograms of fertilizers, in addition to fluorocarbonate apatite, diffraction bands belonging to calcium nitrate (2.05A^{o}), calcium hydroorthophosphate (3.13A^{o}), ammonium nitrate (3.92A^{o}) are recorded.

The X-ray diffraction pattern of the second fertilizer also shows peaks of 3.17 Å^{o}; 2.67A^{o}; 3.92; 2.80 and 2.23 A^{0} respectively, which can be attributed to calcium nitrate, calcium dihydroorthophosphate, ammonium sulfate, and ammonium nitrate.

The spectrograms of nitrogen-phosphorus fertilizers obtained by decomposition with nitric acid without treatment and treatment with sulfuric acid show the presence of gas absorption at 1400; 1550cm^{-1}characteristic for tetrahydrate calcium nitrate.

The IR spectra characterized by 1600 cm^{-1} bands apparently belong to the undecomposed phosphate part of the fertilizer. In the spectrograms, the brightly expressed absorption bands are 1055; 1354; 1380; 1733; c^{-1} refer to Ca $(NO_3)_2 \cdot 4H_2O$, $CaHPO_4 \cdot 2H_2O$ and $(NH_4)_2SO_4$.

The thermal behavior of fertilizers is important for determining the influence of the material composition, including impurities in the raw material, on the temperature characteristics and the nature of thermal effects accompanying the transformations of minerals during heating.

Thermal studies were conducted for two samples obtained by decomposition of phosphorites at a nitric acid norm of 50% from unenriched Kyzylkum phosphorite. The DTA curves are almost similar in terms of the nature of thermal effects, only a change in the depth of individual thermal effects was noted, caused by the influence of the quantitative ratio of phosphate, nitrate, and sulfate salts in fertilizers.

In the fertilizer obtained by decomposition with nitric acid (Figure 2), the content of Ca $(NO_3)_2$ *$4H_2O$, CaO P_2O_5, Ca $(H_2PO_4)_2$ is observed. With increasing temperature, the following changes are observed: at 75 -175

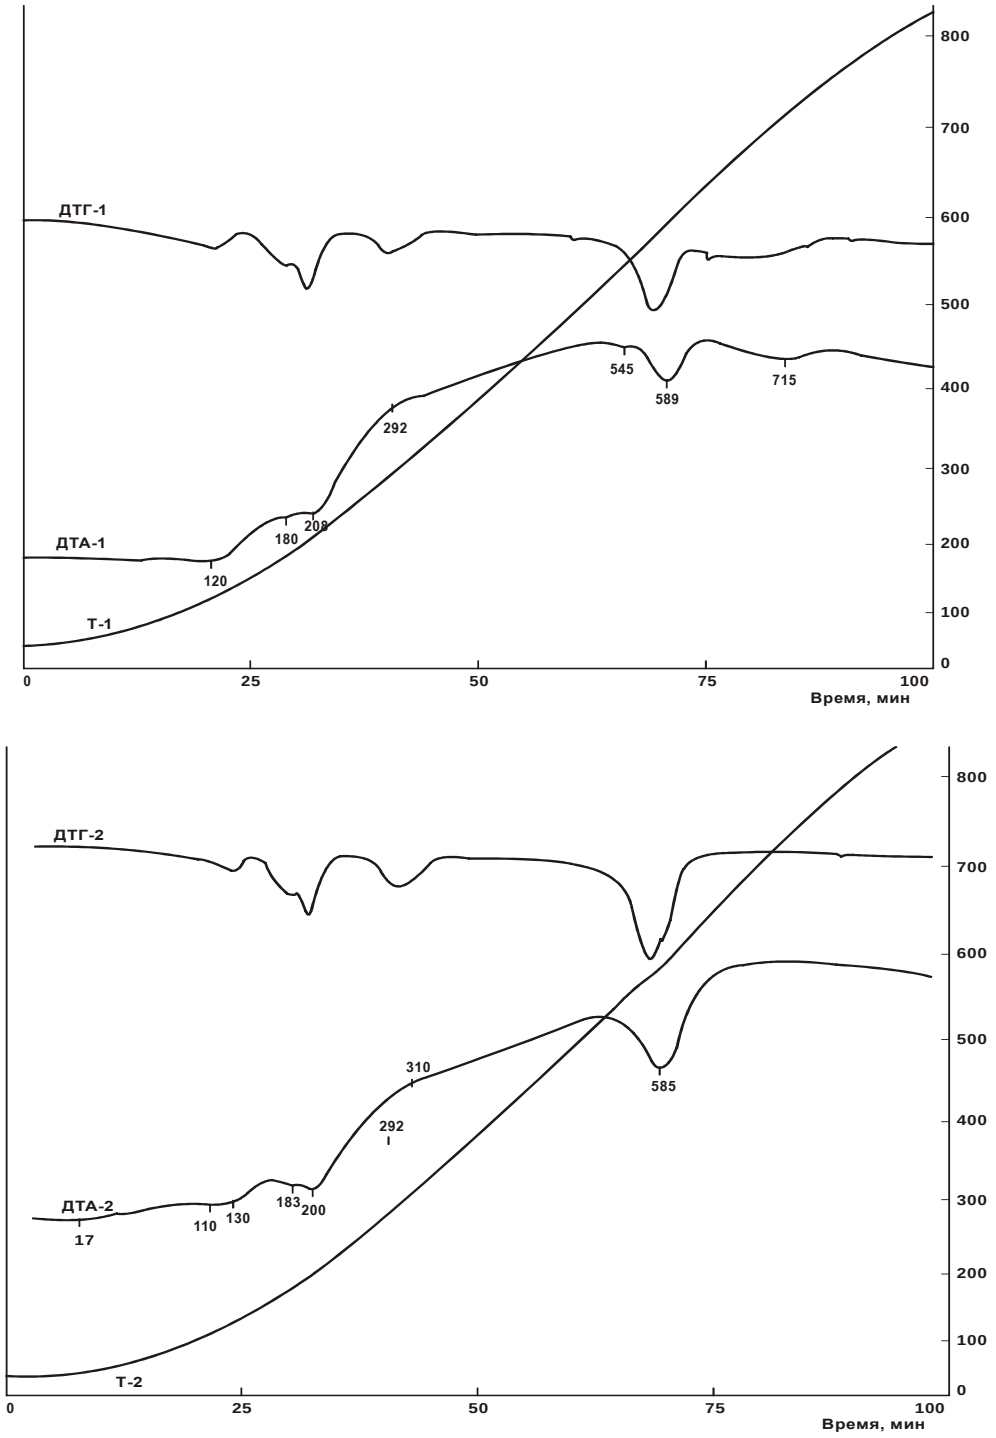

Fig. 2. Derivatograms of nitrogen-phosphorus fertilizers obtained:
1.Decomposition by nitric acid without sulfuric acid treatment.
2. Decomposition with nitric acid and treatment with sulfuric acid.

^{o}C absorption water loss occurs, which is observed on the DTA curve at a temperature of 120 ^{0}C.

At a temperature of 175-260 ºC, the loss of crystallization water Ca $(NO_3)_2 \cdot 4H_2O$ occurs. This effect is observed in DTA at temperatures of 180 ºC and 200 ºC. The process continues until 260 ºC.

Endothermic effects at 545º C and 589º C temperature indicate the decomposition of calcium nitrate, and at 715ºC - of monocalcium phosphate.

Monocalcium phosphate and dicalcium phosphate are stable at low temperatures. Their modification transformations from low-temperature to high-temperature forms begin at a temperature of 1050ºC.

In the thermogram of a nitrogen-phosphorus fertilizer stabilized with sulfuric acid, ammonium sulfate may be present in addition to known minerals. On the thermogram, in the temperature range of 75-175 ºC, the absorbed moisture begins to evaporate. An endoeffect is observed at a temperature of 130-183 ºC. In the temperature range of 175-260 ºC, a distinct endoeffect is observed at a temperature of 200ºC, indicating the evaporation of crystallization moisture from Ca $(NO_3)_2 \cdot 4H_2O$. At a temperature of 585ºC, a distinct endoeffect is observed, describing the process of melting and decomposition of Ca $(NO_3)_2$ to Ca$(NO_2)_2$. When treating nitrogen-phos Calcium phosphates and residual phosphorite acquire greater resistance to thermal decomposition, and their hygroscopic properties improve.

Summary: *This study is devoted to the molecular investigation of species of the genus* Ferula *(Apiaceae) occurring in the flora of Uzbekistan. Based on data retrieved from the NCBI GenBank database, 51 species of* Ferula *were analyzed. Among them, ITS (Internal Transcribed Spacer) sequence data were available for 42 species, while nine species lacked molecular information. The data were processed in the RStudio environment (v4.3.2), and an interactive sunburst diagram was generated using the* plotly *package to visualize the proportion of species with ITS, chloroplast (CP) genome, and missing data. Phylogenetic analysis was conducted with 1,000 bootstrap replicates. The resulting tree revealed several well-supported clades within* Ferula*. In particular,* F. prangifolia, F. kyzylkumica, F. lipskyi, *and* F. karatavica *formed a strongly supported clade with a 98% bootstrap value, indicating close evolutionary relationships. Similarly,* F. korshinskyi, F. sabulosa, *and* F. nuda *clustered into a distinct clade with 96% bootstrap support. The analysis confirmed the monophyly of the genus* Ferula*, indicating that all examined species originated from a common ancestor.* Diplotaenia cachrydifolia *and* Prangos ferulacea *were used as outgroup taxa to root the tree. This study provides important insights into the molecular phylogenetic structure of the genus* Ferula *and establishes a foundation for further systematic and evolutionary research.*

Keywords: Ferula*, ITS, chloroplast genome, NCBI GenBank, RStudio, phylogenetic analysis, flora of Uzbekistan*

Introduction

The genus *Ferula* L. (Apiaceae) comprises plants of significant biological and economic importance. Members of the genus are valued for their essential oils, use as fodder plants, medicinal properties, role in honey production, starch storage, aromatic compounds, nutritional value, and various industrial applications. Due to these biological and economic benefits, *Ferula* species represent a taxonomically and economically important group (Panahi et al., 2018).

At present, the genus *Ferula* includes about 228 recognized species worldwide, distributed from the Macaronesian Islands to the western Himalayas and Ethiopia, and from Eastern–Central Europe to Mongolia (POWO, 2025). In Central Asia, 105 species of *Ferula* have been recorded, of which 63 occur in the flora of Uzbekistan. More than 50 species are distributed in the western Tien Shan, approximately 60 in the Pamir–Alay system, and about 33 species in the southwestern Pamir–Alay region (Yang et al., 2022).

Recent molecular and systematic studies have demonstrated that *Ferula* is a polyphyletic genus and belongs to the tribe Scandiceae within the Apiaceae family (Kurzyna-Młynik et al., 2008). Further investigations in Central Anatolia (Turkey) revealed new endemic species—*Ferula turcica* and *Ferula latialata*—which were described as distinct taxa based on morphological, molecular, and phytochemical evidence (Tuncay et al., 2023). These findings indicate that the genus *Ferula* still harbors a high level of unexplored genetic and evolutionary diversity.

In this study, ITS (Internal Transcribed Spacer) sequence data available in the NCBI GenBank database were analyzed for *Ferula* species distributed in Uzbekistan to clarify their phylogenetic relationships. The main objective of the study was to assess the molecular diversity of *Ferula* species occurring in the flora of Uzbekistan and to determine their evolutionary affinities based on existing molecular evidence.

Materials and Methods

Data sources

In this study, 52 species of the genus *Ferula* (Apiaceae) occurring in the flora of Uzbekistan were examined. For each species, nuclear ribosomal ITS (Internal Transcribed Spacer) and chloroplast (CP) genome sequences were retrieved from the NCBI GenBank database. Specific searches were performed using scientific species names as keywords to ensure accurate data collection. The overall analysis revealed that ITS sequence data were available for 43 species, while nine species lacked molecular information in GenBank.

Data processing and visualization

The processing, classification, and visualization of molecular data availability were carried out in the RStudio environment (v4.3.2). A primary dataset was first compiled in Microsoft Excel 2021 and imported into R using the *readxl*, *dplyr*, and *plotly* packages. For each species, the presence or absence of ITS and CP marker data was encoded as "1" (present) or "0" (absent). Based on these data, an interactive sunburst diagram was generated to simultaneously display the proportion of *Ferula* species possessing ITS, CP, or no molecular data. The diagram was constructed using the *plotly* package and exported to high-quality HTML and PNG formats using the *htmlwidgets* and *webshot2* packages.

Phylogenetic analysis

ITS sequences of *Ferula* species were downloaded from the NCBI GenBank database in FASTA format and used for phylogenetic reconstruction. Phylogenetic analysis was performed using the RAxML program (v8.2.12) under the Maximum Likelihood (ML) criterion with 1,000 bootstrap replicates. The best-scoring ML tree was selected among all inferred trees, and the corresponding RAxML_bipartitions output file was generated. The tree was rooted using *Diplotaenia cachrydifolia* and *Prangos ferulacea* as outgroup taxa, as they are considered the closest relatives of *Ferula*. The final tree was visualized and edited in FigTree software (v1.4.4).

Results

A total of 51 species of the genus *Ferula* distributed in Uzbekistan were analyzed. According to the search results from the NCBI GenBank database, ITS (Internal Transcribed Spacer) sequence data were available for 42 species, while nine species lacked molecular information (Fig. 1).

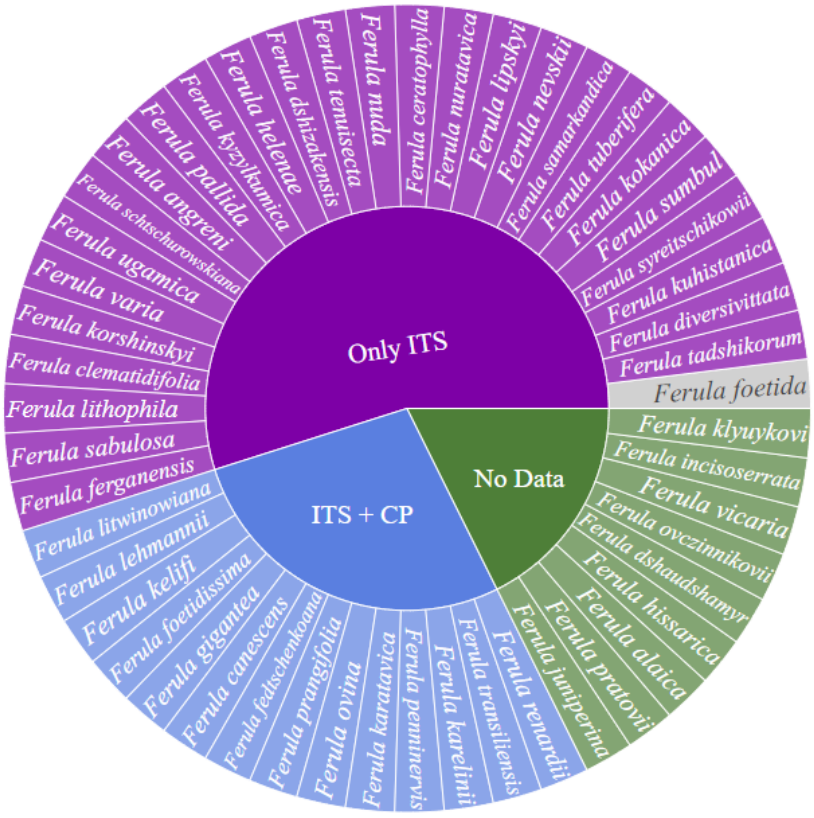

Figure 1. Analysis of the availability of molecular marker data for *Ferula* species occurring in Uzbekistan (based on NCBI GenBank information).

Phylogenetic relationships among *Ferula* species were analyzed based on ITS (Internal Transcribed Spacer) sequence data (Fig. 2). The analysis was performed using ITS sequences obtained from the NCBI GenBank database.

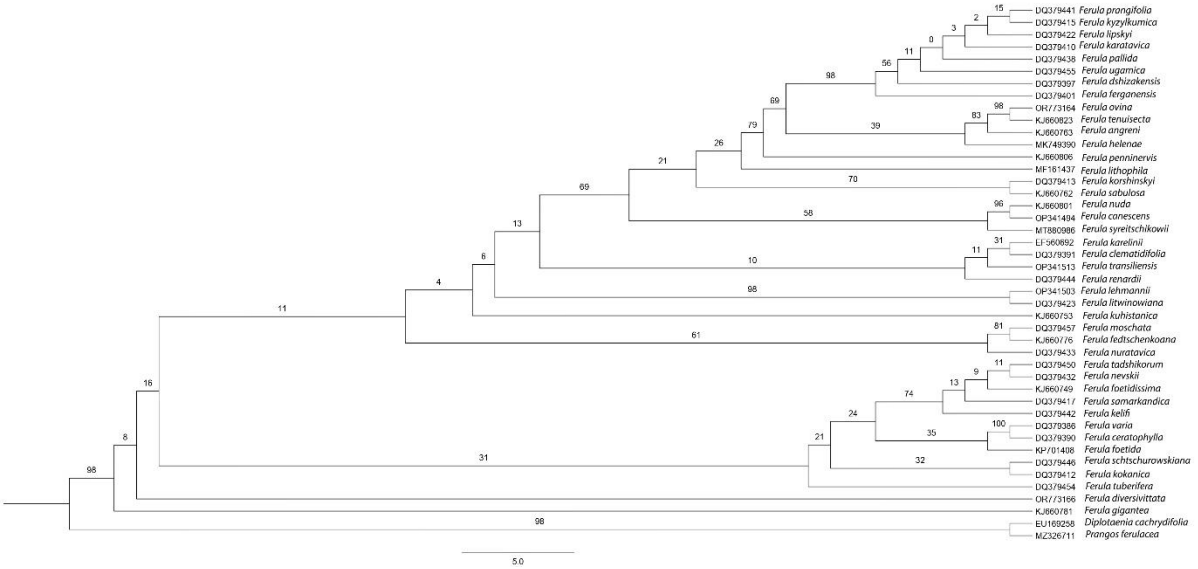

Figure 2. Phylogenetic tree of *Ferula* species based on ITS (Internal Transcribed Spacer) sequences constructed using the Maximum Likelihood (ML) method in RAxML.

Results

The Maximum Likelihood phylogenetic tree constructed in RAxML revealed the evolutionary relationships among *Ferula* species distributed in Uzbekistan. Node values represent bootstrap support percentages based on 1,000 replicates.

The results showed that *Ferula* species were divided into several well-supported major clades. In the upper part of the tree, *F. prangifolia*, *F. kyzylkumica*, *F. lipskyi*, *F. karatavica*, and *F. pallida* formed a strongly supported clade with a bootstrap value of 98%, indicating close evolutionary relationships. In the middle portion, *F. korshinskyi*, *F. sabulosa*, and *F. nuda* grouped together with 96% bootstrap support, reflecting high genetic affinity among them. Similarly, *F. moschata*, *F. tedtschenkoana*, and *F. nutans* clustered with 81% bootstrap support, suggesting moderate genetic relatedness and possible recent divergence.

In the lower part of the tree, *F. varia*, *F. ceratophylla*, *F. foetidissima*, and *F. samarkandica* formed a clade supported by a 74% bootstrap value, closely associated with *F. koksana* and *F. tuberifera*, together forming a distinct evolutionary branch.

The tree was rooted with *Diplotaenia cachrydifolia* and *Prangos ferulacea*, which were used as outgroup taxa closely related to *Ferula*. The inclusion of these outgroups allowed for correct tree orientation and reliable identification of the major *Ferula* clades.

Overall, the RAxML analysis demonstrated clear phylogenetic differentiation among *Ferula* species, with several lineages supported by high bootstrap values. The ITS-based phylogenetic tree accurately reflected the internal genetic structure of the genus, revealing evolutionary affinities and genetic divergence among taxa. These results provide a molecular framework for future comparative studies involving chloroplast genome (CP) data to better elucidate the evolutionary history of *Ferula*.

Discussion

The results of this study highlight the current state of molecular data availability and phylogenetic relationships among *Ferula* species in the flora of Uzbekistan. Analysis of the NCBI GenBank database revealed that 42 out of 51 species possessed ITS sequence data, confirming the ITS region as one of the most informative molecular markers for phylogenetic inference within *Ferula*.

The Maximum Likelihood tree generated in RAxML indicated a complex but evolutionarily coherent structure of relationships among *Ferula* species. High bootstrap support values confirmed strong genetic relatedness within certain clades, while lower values in other parts of the tree may reflect incomplete lineage sorting or unresolved genetic variation.

The clade comprising *F. prangifolia*, *F. kyzylkumica*, *F. lipskyi*, and *F. karatavica* (bootstrap = 98%) represents a well-defined evolutionary group widespread in Central Asia. Their close genetic similarity is consistent with previously reported morphological similarities (Maslova et al., 2017; Pimenov & Leonov, 2004), suggesting adaptation to similar ecological and climatic conditions.

The second major clade, including *F. korshinskyi*, *F. sabulosa*, and *F. nuda* (bootstrap = 96%), also indicates strong genetic relatedness. Morphologically, these species share similar leaf architecture and fruit characteristics (Korovin, 1940), supporting the molecular evidence of their close affinity.

Furthermore, *F. moschata*, *F. tedtschenkoana*, and *F. nutans* formed a moderately supported clade (bootstrap = 81%), implying genetic similarity despite some retained molecular differences. These taxa occur in geographically proximate areas, suggesting recent divergence from a common ancestor.

In the lower part of the phylogeny, *F. varia*, *F. ceratophylla*, *F. foetidissima*, and *F. samarkandica* formed a well-supported clade (bootstrap = 74%), sharing a common genetic background despite exhibiting distinct morphological traits.

The use of *Diplotaenia cachrydifolia* and *Prangos ferulacea* as outgroups was essential for determining the evolutionary direction of the tree, confirming the monophyly of the genus *Ferula*. Overall, the results affirm that *Ferula* is a monophyletic group, meaning that all analyzed species originated from a common ancestor. However, the presence of clades with lower bootstrap support indicates the need for further molecular and taxonomic studies to fully resolve phylogenetic relationships. Integrating molecular data with morphological evidence will provide a more comprehensive understanding of the intrageneric systematics of *Ferula*.

Conclusion

This study presents, for the first time, a systematic analysis of molecular data and phylogenetic relationships of *Ferula* species distributed in Uzbekistan using RStudio and RAxML environments. Database analysis revealed that 42 out of 51 species possess ITS sequence data, confirming the ITS region as an effective genetic marker for assessing genetic relatedness and evolutionary patterns within the genus.

The ITS-based phylogenetic tree demonstrated clear genetic differentiation among species and confirmed the polyphyletic origin of the genus *Ferula*. Several species formed highly supported clades, while others represented distinct evolutionary lineages. These results reveal the genetic diversity of *Ferula* species and their differentiation processes influenced by geographic and ecological factors. The findings provide a molecular foundation for future expanded phylogenetic research based on chloroplast DNA (CP markers) or multi-gene combinations (ITS + *rbcL* + *matK*), contributing to a deeper understanding of the evolutionary history of the genus *Ferula*.

CONSERVATION STATUS AND ECOLOGICAL ANALYSIS OF THE ENDANGERED MEDICINAL PLANT *LAGOCHILUS INEBRIANS* (BOZULBANG) IN UZBEKISTAN

Safarova Sh., Karimov B., Yusupov Z.
Institute of Botany, Academy of Sciences of the Republic of Uzbekistan, Tashkent, Uzbekistan

Summary: *Lagochilus Bunge ex Benth. (Lamiaceae) includes 46 species distributed worldwide. In the flora of Uzbekistan, this genus is represented by 18 species, four of which (L. vvedenskyi, L. olgae, L. proskorjakovii, and L. inebrians) are listed in the Red Data Book of the Republic of Uzbekistan. Anthropogenic pressures such as overgrazing, collection for medicinal purposes, habitat degradation, and drought have led to a reduction in the population size and distribution area of Lagochilus species. L. inebrians exhibits sedative, hypotensive, and antiallergic effects, and contains diterpene alcohol lagokhilin, essential oils, tannins, and vitamins. The Extent of Occurrence (EOO) of L. inebrians is 88,817 km², and its Area of Occupancy (AOO) is 96 km², mainly distributed in the Western Tien Shan and Central Asian semi-desert regions. Based on IUCN Red List criteria, this species could be assessed as "Endangered." This study emphasizes the need for habitat protection, population monitoring, and restoration efforts to ensure the conservation of L. inebrians in its natural environment in Uzbekistan.*

Keywords: *Lagochilus inebrians, conservation status, ecoregion, endangered species.*

Introduction

The genus *Lagochilus* Bunge ex Benth. belongs to the family Lamiaceae and comprises 46 species distributed across arid and semi-arid regions of the world [12]. In the flora of Uzbekistan, 18 species of *Lagochilus* have been recorded [7], four of which (*L. vvedenskyi*, *L. olgae*, *L. proskorjakovii*, and *L. inebrians*) are included in the Red Data Book of the Republic of Uzbekistan [8].

Populations of *Lagochilus* species are declining under the influence of anthropogenic factors such as livestock grazing, harvesting for forage and medicinal raw materials, and trampling [2,4,13]. Insufficient water supply and prolonged droughts are additional natural factors contributing to population reduction [10].

Lagochilus inebrians Bunge (Lamiaceae) extract is used as a sedative, hypotensive, antiallergic, and hemostatic agent. The plant contains diterpene alcohol lagokhilin, mono- and diacetyl derivatives of lagokhilin, vulgarol, essential oils, tannins, resins, carotene, vitamins K and C, organic acids, calcium, magnesium, and about 20 trace elements [3,6,15]. *L. inebrians* exhibits a wide range of therapeutic effects and is used in traditional and folk medicine as an infusion or decoction for its hemostatic properties [1].

Previous studies have investigated the ethnobotany [1], phytochemistry, and pharmacological properties [3] of *L. inebrians*. Additionally, microclonal propagation techniques under in vitro conditions have been developed [14]. However, no detailed studies have been conducted on the species' conservation status or eco-regional analysis. Therefore, this study provides a comprehensive assessment of the conservation condition and ecological distribution of *L. inebrians* in Uzbekistan.

Research Methodology.

To determine the distribution range of the medicinal plant *Lagochilus inebrians*, data from the National Herbarium of Uzbekistan (TASH), the Global Biodiversity Information Facility (GBIF), iNaturalist, and the database "Plants and Lichens of Russia and Neighboring Countries" (Plantarium) were used. Herbarium records were converted into GPS coordinates. For the ecoregional analysis, the map of terrestrial ecoregions of the world [11] was clipped to the territory of Uzbekistan using ArcGIS software. The Extent of Occurrence (EOO) and Area of Occupancy (AOO) were calculated using the GeoCAT platform.

Analysis and Results.

The main part of *L. inebrians* populations was found to grow in the Alai–Western Tianshan steppe ecoregion, and partly in the Central Asian southern desert and Badkhiz–Karabil semi-desert

ecoregions (Fig. 1).
The distribution range (EOO) of *Lagochilus inebrians* is 88,817 km², while the area of occupancy (AOO) is 96 km². The reduction in population size and habitat range of this species is mainly caused by factors such as insufficient precipitation, trampling by livestock, and large-scale harvesting over many years.

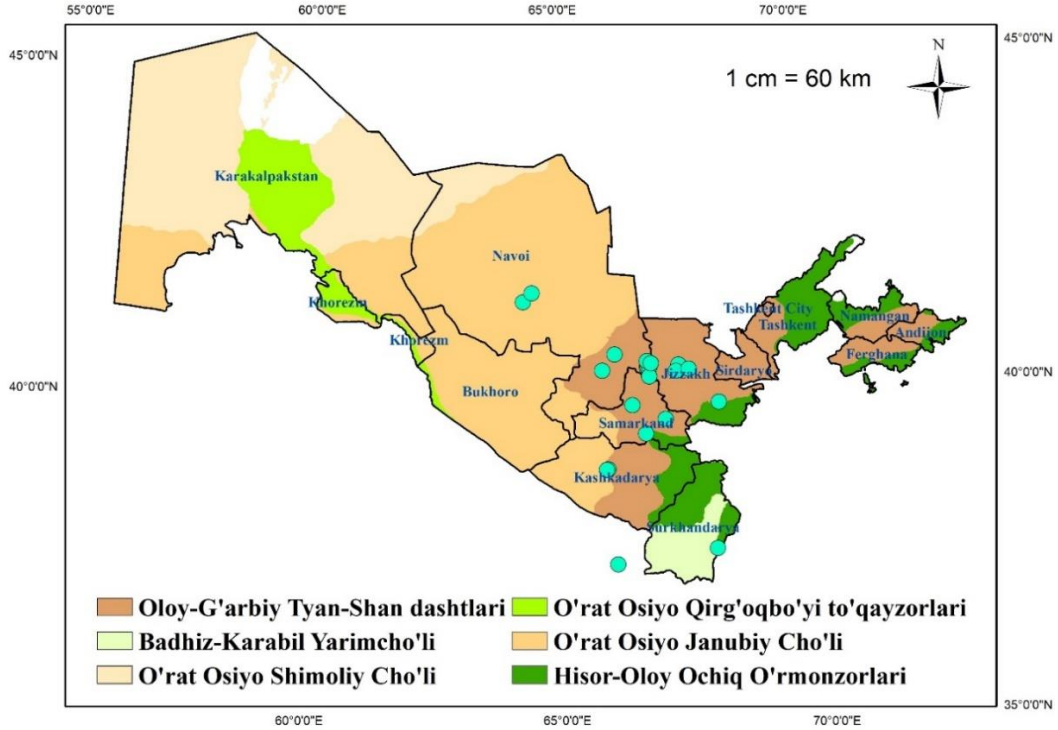

Figure 1. Distribution of *Lagochilus inebrians* across ecoregions

The species *Lagochilus inebrians* has not yet been formally assessed according to the criteria of the International Union for Conservation of Nature (IUCN) Red List. However, this species is included in the Red Data Book of the Republic of Uzbekistan, and there is evidence that its natural habitats are shrinking and being affected by anthropogenic factors. Based on these observations, *L. inebrians* may be considered as a species at high risk of extinction (Endangered).

Figure 2. Assessment of the conservation status of *Lagochilus inebrians*

The restricted distribution range, small population size, and various threats to its survival indicate the urgent need for conservation measures to prevent further reduction or possible extinction of *L. inebrians* within its natural range.

To ensure the long-term conservation and restoration of *L. inebrians* in Uzbekistan, the following actions are recommended:

Population monitoring and assessment: Regular monitoring of the status and dynamics of *L. inebrians* populations. Evaluation of population size, distribution area, and habitat characteristics. Collection and analysis of data on population conditions and threats.

Habitat protection: Preservation and protection of key habitats important for *L. inebrians*. Limitation of grazing, harvesting, and other anthropogenic impacts in the regions where the species occurs. Restoration and management of ecosystems to mitigate the effects of climate change.

Population recovery and propagation: Development of microclonal propagation technologies for *L. inebrians* to support both *ex situ* and *in situ* conservation. Implementation of programs aimed at strengthening natural populations and reintroducing the species into new suitable habitats.

Legislation and management: Inclusion of *L. inebrians* in the official IUCN Red List. Improvement of legislation regulating the protection and sustainable use of the species' habitats. Development of effective management strategies in cooperation with local communities, landowners, and other stakeholders.

Research and education: Promotion of new research on the biology, ecology, pharmacology, and ethnobotany of *L. inebrians*. Training of qualified specialists in species conservation and management. Raising public awareness about this species and its protection through mass media and the educational system.

The effective implementation of these approaches is crucial for ensuring the long-term conservation and restoration of *L. inebrians* within its natural range in Uzbekistan.

Conclusion.

The genus *Lagochilus* Bunge ex Benth. is represented by 18 species in the flora of Uzbekistan, four of which are listed in the Red Data Book. The populations of *Lagochilus inebrians* are under threat due to anthropogenic factors and natural conditions. Its extent of occurrence is 88,817 km², and its area of occupancy is 96 km². The species requires formal assessment under the IUCN evaluation system, but it is likely to be classified as Endangered. Ensuring the conservation of *L. inebrians* can be achieved through long-term protection and restoration measures, population monitoring, habitat conservation, and public awareness initiatives.

Summary: *The article examined the acute toxic properties of the supramolecular complexes of the monoammonium salt of glycyrrhizic acid with succinic acid (MASGA:SA) in a 2:1 molar ratio and the monoammonium salt of glycyrrhizic acid with bislupinine ether of succinic acid (MASGA:SA) in a 4:1 molar ratio on laboratory mice. LD_{50} indicators were determined based on the OECD criteria (2001). The changes in the body mass of mice were recorded and statistically analyzed. Also, these substances in high doses (5000 mg/kg) do not have toxic effects and are classified as relatively harmless compounds belonging to the VI class according to the OECD classification. These results will serve as an important theoretical basis for the development of pharmacological preparations in the future.*

Key words: *Monoammonium salt of glycyrrhizic acid, succinic acid, lupinine, supramolecule, acute toxicity, mice, LD_{50}, pharmacology, drug, MASGA:SA, MASGA:SLE, OECD classification, statistical analysis, dose, respiration, body weight, quarantine conditions, triterpenoid.*

Introduction

In recent years, interest in complex compounds derived from natural substances has been increasing in the fields of pharmaceuticals and medicine. Glycyrrhizic acid, a triterpenoid obtained from the roots of licorice, is well known for its anti-inflammatory, antioxidant, hepatoprotective, and antiviral effects. It has long been widely used in traditional medicine, particularly in Eastern countries (Ibn Sina). Numerous studies conducted by English and Russian researchers have confirmed its pharmacological properties (Haraguchi et al., 1998; Wang et al., 2013; Mironov, 2012).

Among plant growth stimulators, organic acids are considered effective agents for increasing the productivity of agricultural crops. Their application in crop science allows for accelerating flowering, reducing fruit drop, enhancing plant tolerance to drought, ensuring uniform ripening suitable for mechanized harvesting, and influencing various other developmental processes. Succinic acid, as an important metabolite of the Krebs cycle, represents a central component of cellular energy metabolism. It activates redox reactions in the organism and exhibits adaptogenic effects (Grishina, 2015).

Therefore, the search for new, highly effective, and environmentally safe plant growth stimulants based on succinic acid and its derivatives is of great significance. Consequently, studying the biological activity of supramolecular complexes formed from glycyrrhizic acid and succinic acid has become an important research direction. Without determining their toxicological safety, their application in pharmaceuticals and agriculture cannot be justified. For this reason, our study is devoted to evaluating the acute toxicity of complexes derived from glycyrrhizic acid and succinic acid in laboratory mice.

During the research, supramolecular complexes with different ratios (MASGA:SA, 2:1 and MASGA:SLE, 4:1) were synthesized using monoammonium glycyrrhizinate obtained from licorice roots growing in the Aral Sea region, based on methods described in the literature (Nuriyeva M.U. et al., 2023). Solutions of the obtained supramolecular compounds were prepared in various concentrations and ratios, and their effects on the germination and pigment accumulation processes of autumn and spring wheat grains were tested under laboratory and field conditions in the saline soils of the Republic of Karakalpakstan.

Literature Review

A considerable body of scientific literature provides information on the biological activities of glycyrrhizic acid derivatives. Haraguchi et al. (1998) demonstrated the effective antiviral activity of glycyrrhizic acid against influenza virus. Wang et al. (2013) confirmed its hepatoprotective properties, while Matsumoto et al. (2013) reported its positive effects on the immune system.

Extensive data are also available in Russian scientific sources. Mironov (2012) presented key methodological approaches in the toxicology of medicinal substances, whereas Stefanov (2002) described methods for conducting preclinical studies. Alekseeva (2010) provided insights into the role of succinic acid as a metabolic regulator, and Grishina (2015) elaborated on its significance in cellular bioenergetics. Based on these studies, complexes of glycyrrhizic and succinic acids are regarded as promising pharmacological agents.

In Uzbekistan, researchers such as S.V. Lukyanova, A.A. Toychiev, D.N. Dalimov, A.A. Akhunov, and H.H. Qoshiev have studied the effects of various physiologically active substances on the growth and development of agricultural crops. Studies by Allaniyazova M.K. (2023) and Djuraev T.A. (2019) have examined the mechanisms by which triterpenoid compounds influence wheat growth and development, highlighting the scientific and practical relevance of this research direction.

In our study, the acute toxicity of the most effective supramolecular complexes MASGA:SA (2:1) and MASGA:SLE (4:1) was evaluated using a mouse model. The experiments were conducted in collaboration with L.U. Makhmudov at the Pharmacology and Screening Laboratory of the Institute of Bioorganic Chemistry named after academician O.S. Sodiqov, Academy of Sciences of the Republic of Uzbekistan.

Materials and Methods

The experiments were conducted using the acute oral toxicity test at a fixed dose, as strictly recommended by OECD (2001).

This test allows for the assessment of acute toxicity of chemical substances through a single oral administration. Supramolecular complexes MASGA:SA (2:1) and MASGA:SLE (4:1) were administered to groups of animals of the same sex in a stepwise manner at a fixed dose of 5000 mg/kg. The experiments used male albino laboratory mice weighing 22 ± 2 g. The animals were kept under quarantine conditions for 10–14 days and selected for pharmacological testing when healthy and sexually mature.

The study was conducted in two stages. On the first day of stages I and II, the general condition of the animals was monitored hourly, including signs of tremors and possible mortality. For up to two weeks, all animals were observed daily for general condition, locomotor activity, skin and coat condition, respiration rate and depth, urine output, body weight changes, and other parameters [8]. The animals were provided with standard diet and water ad libitum.

The animals were divided into three groups (control and two experimental groups):

- **Control group** – received distilled water.
- **Experimental group 1** – received MASGA:SA (2:1) at a dose of 5000 mg/kg orally.
- **Experimental group 2** – received MASGA:SLE (4:1) at a dose of 5000 mg/kg orally.

The observation period lasted 14 days. Data were analyzed using arithmetic mean (M) and standard error of the mean (m). Statistical significance was accepted at $p<0,05$.

Results

Following oral administration of MASGA:SA at 5000 mg/kg, mice exhibited short-term accelerated respiration, temporary immobility, and slight narrowing of the eyes within 5 minutes. These effects lasted 15–20 minutes, after which normal behavior resumed.

After oral administration of MASGA:SLE at 5000 mg/kg, similar signs were observed 8 minutes post-administration and lasted 10–15 minutes, after which normal activity returned. Throughout the experiment, no mortality was recorded in mice receiving either MASGA:SA or MASGA:SLE at 5000 mg/kg (5/0).

No significant differences in body weight changes of mice in the experimental groups were observed compared to the control on days 7 and 14 ($p > 0.05$). The mean lethal dose (LD_{50}) for both complexes was determined to be $LD_{50} > 5000$ mg/kg, confirming their low acute toxicity (Table 1).

Table 1.

Evaluation of Acute Toxicity of Supramolecular Complexes GKMAT:SA (2:1) and GKMAT:YLE (4:1) in Male Mice (M ± m, n=5)

Group	Dose,mg/kg, ml	Total Animals / Deaths	Average Body Weight, g			LD_{50}, mg/kg
			Day 1	Day 7	Day 14	
Control	0,4 ml	5/0	22,0 ± 1,9	22,6 ± 2,2	23,2 ± 2,3	-
MASGA:SA (2:1)	5000 mg/kg	5/0	21,6 ± 1,8	21,9 +2,1	23,0 ± 2,2	>5000
MASGA:SLE (4:1)	5000 mg/kg	5/0	21,0 ± 2,0	21,7 ± 2,0	22,8 ± 2,1	>5000

Discussion

The results of this study confirmed that supramolecular complexes based on glycyrrhizic acid and succinic acid do not exhibit acute toxicity even at high doses. This indicates their potential as safe components for the development of pharmaceutical preparations.

Other studies have also highlighted the toxicological safety of glycyrrhizic acid derivatives (Fiore et al., 2008; Chen et al., 2019). However, the effects of long-term administration, including chronic toxicity, reproductive toxicity, and mutagenicity, have not yet been sufficiently investigated.

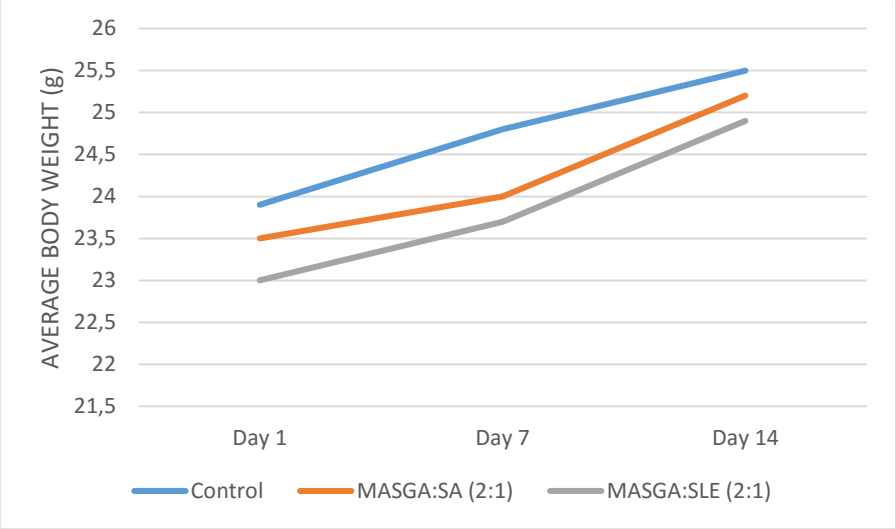

Figure 1. Body weight changes in mice during the experiment

Conclusion

1. Administration of the MASGA:SA (2:1) complex to mice at a dose of 5000 mg/kg resulted in no mortality, with an $LD_{50} > 5000$ mg/kg.
2. The MASGA:SLE (4:1) complex was also found to be safe at the same high dose. According to OECD classification, both complexes belong to Class VI, indicating relatively harmless substances.

These findings provide a significant scientific basis for the future development of glycyrrhizic acid and succinic acid complexes as pharmaceutical agents and as environmentally safe, effective biostimulators for enhancing plant growth in agriculture.

CONCEPT OF DESERTIFICATION AND DEFINITIONS PROVIDED FOR IT

Adilova O.A.
Jizzakh State Pedagogical University

Summary: *The article examines the process of desertification, its causes and consequences, as well as various definitions of desertification given by scientists. In addition, the study explores issues such as the broad promotion of innovative projects aimed at combating desertification and drought, increasing the awareness of the local population regarding measures to fight desertification and drought, and the development and practical implementation of programs ensuring sustainable land use.*

Key words: *arid, desertification, degradation, scale, pasture, ecosystem, geosystem, erosion, ecological migration, ecosystem, intensive, humus.*

Introduction. Desertification is a geographical and ecological process in which soil degradation and loss of fertility occur in arid and semi-arid regions, leading to the deterioration of all forms of organic life and a decline in the natural and economic potential of these territories. This process develops under the influence of human activity and climate change, resulting in the expansion of desert areas.

Desertification arises due to natural and anthropogenic (human-induced) factors. The main factors include deforestation, climate change, improper irrigation, overgrazing, and others. As a result, agricultural lands and pastures deteriorate, negatively affecting agriculture and ecosystems.

Today, desertification is one of the major environmental, social, and economic challenges facing humanity. Among the primary drivers of this process are the continuous growth of the population and technological development, which increase the scale and intensity of desertification.

Desertification occurs on almost all continents, particularly in the arid regions of Africa, Asia, Australia, and South America.

Main Part. This process manifests differently in plains compared to mountain and foothill areas due to variations in precipitation, resource usage, and climatic elements. In plains, land is mainly used for irrigated agriculture, whereas in mountain and foothill regions it is used for rain-fed agriculture, pasture farming, mining, and other purposes. Therefore, today the greatest anthropogenic pressure falls on mountain and foothill areas.

Although the mountainous and foothill regions occupy only a small southeastern part of our country, they rank high in terms of intensity of land use. As a result, years of unplanned exploitation have led to negative consequences.

The desertification process occurring in our country and the development of preventive measures is not only a matter of scientific research but also a state-level priority. The *Action Strategy for Further Development of the Republic of Uzbekistan* identifies tasks such as ensuring an ecologically safe environment, preventing environmental problems harmful to public health, and preserving the gene pool.

Additionally, Presidential Decree No. PK-4204 (February 22, 2019) “On measures to improve the efficiency of activities to combat desertification and drought,” the Law “On Pastures” (May 20, 2019), and other legal documents emphasize the need to conduct natural-geographical research and apply its findings in practice.

Despite many scientific articles, projects, and studies being carried out on the causes, consequences, and prevention of desertification, much of the research remains in theoretical form. Desertification is not a process that occurs within a few months or even a few years; it requires long periods of time and continuous monitoring to properly observe its dynamics.

According to researchers, both natural and anthropogenic factors contribute to modern desertification. Depending on the region, these factors and their indicators vary. Natural factors mainly include wind and precipitation levels, while anthropogenic factors include population growth, increased livestock numbers in mountain areas, agriculture, and other human activities.

Desertification not only affects the areas where it occurs but also reduces water resources, biodiversity, and alters climate conditions in other regions. This leads to rising food prices, disruption of market mechanisms, and increases in social and political tensions worldwide.

Scientific Definitions of Desertification

Desertification refers to the cumulative effect of natural and anthropogenic factors that cause degradation of landscapes and ecosystems in arid regions, leading to a decline in biological productivity and natural-economic potential. It affects the living standards and health of the population, resulting in forced migration.

Many scientists, both domestic and foreign, have proposed various definitions of desertification based on their research regions.

• S. B. Abbasov defines desertification as the reduction of productive land, degradation of ecosystems, aridification of climate, and expansion of desert territories — essentially a disturbance of ecosystem balance.

• L. A. Alibekov describes it as a complex process of environmental degradation in arid zones, including loss of vegetation, water and wind erosion, soil salinization, reduction of humus, and a decline in biological productivity.

• U. Q. Nazarov views desertification as the impoverishment of landscape ecosystems, leading to reduced biological productivity, increased salinization, and intensified erosion.

The UN Convention to Combat Desertification defines desertification as "land degradation in arid, semi-arid, and dry sub-humid areas resulting from various factors, including climate change and human activities."

• Dregne (1976) states that desertification is a process caused by the combined effects of human activities and drought, resulting in decreased vegetation productivity, changes in fauna and flora, intensified soil erosion, and threats to employment.

• Le Houerou H.N (1972) argues that desertification is primarily linked to human activity rather than climate change, emphasizing demographic pressure and overgrazing, agricultural overuse, deforestation, and mechanized farming.

• Rozanov and Zonn (1980) define desertification as irreversible degradation of vegetation and soil cover in arid regions, leading to reduced biological productivity and transforming territories into deserts.

Worldwide, continuous population growth and increased anthropogenic pressure on landscapes contribute significantly to desertification. According to UNEP, deserts formed by human influence already exceed 9 million sq. km, and 7 million hectares of agricultural land are affected by desertification each year.

Arid regions cover 30% of the world's land surface, containing 145 million hectares of irrigated land, 170 million hectares of rain-fed land, and 3.6 billion hectares of pastures. Over 860 million people live in these areas. Central Asia is one of the major regions where desertification is rapidly intensifying, with a population of over 70 million. The increasing population and intensive use of natural resources are driving desertification in both plains and mountain regions.

The worsening ecological situation in arid regions worldwide requires ecological load regulation, continuous monitoring, use of advanced desertification-control technologies, creation of pasture cadasters, and development of predictive thematic maps.

Conclusion. In our country as well, desertification is progressively advancing from plains to higher elevations. The scale and intensity of desertification in mountain and foothill regions indicate that if preventive measures are not taken, vast mountain landscapes may turn into barren rocky deserts within several decades, causing severe ecological consequences.

Addressing this urgent environmental problem requires conducting field experiments to quantitatively evaluate desertification dynamics and applying modern methods such as aerospace monitoring, geoinformation systems, cartography, and other technologies to implement a comprehensive and systematic approach to combating desertificat

AGROTECHNOLOGY OF THYMUS VULGARIS AND WAYS TO IMPROVE ITS BIOECOLOGICAL CHARACTERISTICS

Erkinova N.O'., Shaymatov S.
Jizzakh State Pedagogical University
email: erkinovanargizajk2802@gmail.com

Summary: *The article discusses the agrotechnological aspects of Thymus vulgaris cultivation and the improvement of its bioecological characteristics under various environmental conditions. The study focuses on optimizing soil preparation, planting density, irrigation regimes, and nutrient management to achieve higher yield and better essential oil quality. Particular attention is paid to the influence of ecological factors such as temperature, humidity, and light on the growth and development of Thymus vulgaris. The research also highlights the plant's adaptability to arid climates and its potential for sustainable cultivation in ecologically sensitive regions. The results contribute to the development of advanced cultivation technologies and demonstrate the importance of integrating agroecological principles in medicinal and aromatic plant production systems.*

Key words: *Thymus vulgaris, agrotechnology, bioecological characteristics, plant cultivation, propagation methods, ecosystem adaptation, root system, photosynthetic efficiency, winter hardiness, pest resistance.*

Thymus vulgaris L., commonly known as thyme, is a medicinal and aromatic plant belonging to the Lamiaceae family, widely used in pharmaceuticals, cosmetics, and the food industry [1;2]. Studying the agro-technological and bioecological characteristics of this plant is crucial for improving its yield, enhancing essential oil content, and ensuring ecosystem adaptability [3;4]. Research indicates that photosynthetic efficiency, root system development, and winter hardiness are key factors determining the economic and ecological significance of Thymus vulgaris [5]. Therefore, scientific studies focused on improving the agro-technological methods, propagation, and bioecological traits of Thymus vulgaris are highly relevant.

Furthermore, studying the bioecological characteristics of Thymus vulgaris is also ecologically significant. Root system development, photosynthetic efficiency, leaf morphology, and winter hardiness determine the plant's adaptability to environmental conditions [3;4]. Various studies have shown that plant chemotypes and agro-technological conditions significantly affect essential oil yield and composition [1;2]. Therefore, modern agro-technological research focuses not only on increasing plant yield but also on ensuring its bioecological stability [5].

Experimental trials measuring essential oil content, root system development, and photosynthetic efficiency under different varieties and cultivation conditions provide a scientific basis for developing optimized agro-technological recommendations for Thymus vulgaris [3;4;5].

Site Selection and Climatic Conditions. The optimal site for Thymus vulgaris is sunny, protected from strong winds, and well-drained. The plant thrives in subtropical and temperate climates [1;2]. The ideal temperature range is 15–25°C, and plants should be partially protected from frost and harsh winds [3]. Site selection should also consider ecosystem conditions and soil potential, as the yield and essential oil composition are influenced by climate and location [2;4].

Additionally, microclimate conditions of the area should be considered. Lower, moist slopes reduce yield as excessive soil moisture increases the risk of root rot [3]. Plants flower better in open, wind-protected areas, which improves both the quantity and quality of essential oils [2;4].

Climatic conditions also affect the plant's bioecological characteristics. Dry and warm climates increase growth rates, but excessively high temperatures may lead to leaf desiccation and reduced essential oil content [4;5]. With optimal irrigation, sunny and warm conditions promote rapid development and extended flowering periods, enhancing essential oil yield [3;5].

Soil Requirements and Preparation. Thymus vulgaris grows best in light sandy-loam or medium-loam soils with a pH of 6.0–7.5. Acidic or highly saline soils reduce plant growth [4;5]. Soil preparation involves the following agrotechnical practices:

1. Deep tillage and harrowing: Fields are tilled to a depth of 25–30 cm to improve root development and facilitate water and nutrient penetration [4].

2. Organic fertilizers: Adding compost or manure enhances soil biological activity and supports root growth [5].

3. Mineral fertilizers: Phosphorus and potassium are essential; nitrogen is applied in moderation, as excessive nitrogen promotes vegetative growth and reduces essential oil content [3;5].

4. Drainage and moisture control: Soil preparation must prevent waterlogging, as excess moisture leads to root rot and disease development [4].

Additionally, soil structure and sand content must be considered – overly sandy soils dry out quickly, while heavy loam retains moisture for a long time, potentially slowing plant growth [5].

Propagation and Planting Technology. Thymus vulgaris can be propagated using three main methods: seed propagation, vegetative propagation, and in vitro micropropagation.

I. Seed propagation:

1. Seeds are sown in spring and germinate within 7–10 days [2;3].

2. Seeds should be sown 1–2 cm deep, with row spacing of 30–45 cm, providing optimal growth and air circulation [2].

3. The soil is pre-moistened, and a covering material is applied to enhance germination speed [3].

4. Seed propagation preserves genetic diversity and allows rapid sowing over large areas.

II. Vegetative propagation:

1. Cutting and layering methods are most effective [3;5].

2. Cuttings of 8–12 cm are planted in moist soil and allowed to root for 3–4 weeks.

3. This method accelerates yield and maintains plant quality.

4. Vegetative propagation ensures consistency in essential oil content and quality.

III. In vitro micropropagation:

1. Conducted under laboratory conditions to produce genetically uniform, high-quality plants [1;3].

2. This method is critical for research and industrial purposes, allowing rapid multiplication of high-yielding varieties.

Planting technology:

- Sowing is done in spring or early summer. The soil must be previously tilled and fertilized [4;5].
- Variety selection and planting density directly influence yield and essential oil composition. For example, 30–45 cm row spacing and 20–25 cm plant spacing optimize leaf area development and reduce disease incidence [4].

Figure.1 Thymus Vulgaris cultivated under the climatic conditions of Jizzakh

After planting, mulch is applied to conserve soil moisture and reduce weed growth [5].

Irrigation and Maintenance. Although Thymus vulgaris is drought-tolerant, moderate irrigation during the growing season is crucial for improving yield and essential oil content [4;5]. The optimal irrigation regime depends on plant age and climatic conditions:

Seedling stage: During the first month after sowing, irrigation is applied 2–3 times per week, keeping the soil consistently moist to stimulate root development [3;4].

Growth and flowering stage: Irrigation is reduced to 1–2 times per week, maintaining soil moisture at 60–70 % [4].

Excessive irrigation causes root rot and disease, while insufficient water reduces growth rate and essential oil yield [4;5].

Maintenance practices include:

1. Weeding: Weeds compete for nutrients and moisture, negatively affecting growth and yield [5].

2. Soil loosening and aeration: Loosening the soil improves air penetration, promotes root system development, and reduces disease risk [4].

3. Use of biological pest control agents: Biological agents (ladybugs, Trichoderma sp., Bacillus sp.) are preferred over chemical pesticides to avoid negative effects on essential oil quality [5].

4. Mulching: Covering the soil with organic mulch helps retain moisture and suppress weed growth [4;5].

Regular maintenance also enhances plant stress tolerance, improves winter hardiness, and ensures stable yield [3;5].

ASSESSMENT OF THE IMPACT OF NATURAL AND ANTHROPOGENIC FACTORS ON ECOSYSTEM INDICATORS: RODENTS OF THE SOUTHERN ARAL REGION

Mirametova E.K.
Karakalpak State University named after Berdakh

Summary: *The Southern Aral region has experienced substantial ecological changes in recent decades due to reduced inflows from the Amu Darya and Syr Darya rivers. The shrinking of the Aral Sea has accelerated desertification, ecosystem degradation, and biodiversity loss [1, 2].*

This study, conducted from 2019 to 2023 on the Ustyurt Plateau and the lower Amu Darya area, assessed the effects of climate change and anthropogenic activities on rodent populations, which serve as key bioindicators of ecosystem health. Methods included stationary observations, live trapping, diet analysis, and regression modeling [5, 6].

The results revealed cyclic fluctuations in ***Rhombomys opimus*** *populations and consistently low densities of* ***Microtus ilaeus****, primarily due to habitat degradation, food scarcity, and climatic stress [7, 12]. These findings underscore the necessity of continuous ecosystem monitoring and biodiversity conservation measures in the region [8, 9].*

Keywords: *Southern Aral region, rodents, population density, ecosystem degradation, climatic factors, anthropogenic impact.*

Introduction

The Southern Aral region is a unique natural complex that has undergone significant ecological transformations over recent decades due to both natural and anthropogenic factors [1, 2]. Reduced inflows from the Amu Darya and Syr Darya rivers have caused a dramatic decline in the Aral Sea level, resulting in ecosystem degradation, desertification, and biodiversity loss [1, 3]. Historically, the Aral Sea regulated the local climate by moderating air temperature and humidity [2].

Studying the influence of climatic conditions and anthropogenic pressures on mammalian populations, particularly rodents, is a key objective of modern ecology. Rodents serve as bioindicators for the state of desert and semi-desert ecosystems [5, 7].

Materials and Methods

The research was conducted from 2019 to 2023 on the Ustyurt Plateau and in the lower Amu Darya region. Control points representing typical biotopes—sandy and gypsum deserts, tugai forests, and agricultural lands—were selected for stationary observations [2, 4].

Rodent populations were estimated using night-time visual counts, complete trapping on fixed plots, trapping-plot methods, and route surveys along colonies [5]. Diet analysis included stomach content studies, sampling of vegetation at feeding sites, and feeding experiments [6]. Reproductive activity was assessed through direct observations and literature data [5].

Quantitative analysis of factors affecting population density was performed using multifactor screening and multiple regression models [3, 10, 11]. Population density, as the dependent variable, was expressed as a linear combination of ecological factors: climatic parameters, food availability, and intrinsic population characteristics. Statistical significance was evaluated using Student's t-test and Fisher's F-test, with the coefficient of determination (R^2) indicating the proportion of variance explained [3].

The study focused on **Rhombomys opimus**, dominant in desert ecosystems, and **Microtus ilaeus**, inhabiting wet habitats [7, 12].

Results

Meteorological analysis showed that the climate of the Southern Aral region has become more continental, with summer temperatures reaching 43–48 °C and a 1.5–2.5 °C increase in seasonal temperature variation [1, 2]. Average annual precipitation declined to 130–150 mm, and spring and autumn frost periods lengthened.

Regional ecosystems underwent major transformations: the area of tugai forests decreased by almost 90%, productive hayfields reduced sixfold, and low-productivity grass communities emerged

[2, 3]. Pasture potential declined, resulting in an estimated loss of approximately 5.5 million tons of forage [3].

Rodent populations demonstrated seasonal and multi-year dynamics. **Rhombomys opimus** exhibited cyclic fluctuations influenced by aridification and food availability, while **Microtus ilaeus** remained at consistently low densities due to degradation of wet habitats [7, 12]. Regression analysis confirmed the significant influence of climatic factors, anthropogenic landscape changes, and food availability on population density [6, 8].

Discussion

These results confirm that ecosystem degradation in the Southern Aral region and changes in the hydrological regime of the Aral Sea have a long-term impact on rodent population density and structure. The reduction of tugai forests, desertification, and salinization decrease biological productivity and food resources for rodents [3, 8].

Climatic factors manifest as increased thermal stress and reduced humidity, enhancing soil water evaporation and reducing habitats suitable for moisture-dependent species. Multifactor analysis indicated that adaptive mechanisms in rodents partially compensate for adverse conditions; however, population resilience is limited under intensive anthropogenic pressure [7, 12].

Conclusions

1. Ecosystem degradation in the Southern Aral region and changes in the Aral Sea hydrological regime directly affect rodent population density.
2. Comprehensive ecosystem monitoring and biodiversity conservation measures, including restoration of tugai forests and water resource management, are essential.
3. Rodent adaptive mechanisms partially offset adverse conditions, but populations remain vulnerable without reduced anthropogenic pressures.

IMPACT OF ATMOSPHERIC AIR POLLUTION ON MEDICAL AND ENVIRONMENTAL CONDITIONS IN THE INDUSTRIAL AREAS OF THE SAMARKAND REGION

Turdoliyev M.N.
Email: mirjalolturdaliyev322@gmail.com
Samarkand State University named after Sharaf Rashidov

Summary: *This study examines atmospheric pollution in the industrial zones of the Samarkand region, its impact on public health, and the environmental issues that arise from it. As the region's industrial sectors continue to grow, the release of harmful substances into the air has intensified, leading to a deterioration in air quality and a negative effect on the well-being of local residents. Industrial plants, motor vehicles, and various other human activities represent the primary pollution sources. These contributors reduce air quality and are linked to increasing cases of respiratory illnesses, allergies, asthma, and other health disorders within the population. Promoting environmentally sustainable industrial practices in the Samarkand region is essential, and the paper offers key recommendations aimed at protecting and enhancing environmental and public health in the area.*

Key words: *Samarkand region, industrialized areas, atmospheric air, pollution, environmental problems, medical problems, health, industrial enterprises, transport pollution, air purification.*

Introduction: The problems of air pollution require constant attention, and the economic development of the country will undoubtedly cause an increase in pollution. The increase in the number of vehicles in cities and densely populated areas requires increased control of industrial enterprises over sources of emissions into the atmosphere.

In recent years, as a result of increased human exposure, changes in the gas balance have been observed. It has been established that changing the constant amount of gases in the atmosphere has negative consequences for the planet. Today, independent Uzbekistan is a large industrial and agricultural region, and further development of the global complex of mechanical engineering, energy, chemistry, food industry, and transport is planned in the future. The development of such productive forces has a certain negative impact on the state of socio–ecosystems in the republic. [1]

Under the influence of various environmental and unfavorable anthropogenic factors, serious environmental factors are increasing in our republic, affecting the medical environment, the environment, and human health. It plays an important role in ensuring sustainable development, that is, the health of future generations. [2].

Air pollution has a negative impact on people and the environment. Carbon monoxide, sulfur compounds, nitrogen oxides, inorganic dust, soot, hydrocarbons and other harmful substances are released from industrial enterprises into the atmospheric air. Dust from industrial plants is released into the atmosphere from almost all sources. SO_2, CO, NO_x, heavy metals negatively affect the human body. They affect the central nervous system. [3].

Gases and toxic compounds released by industrial enterprises cause air and water pollution. It causes respiratory diseases, allergies, and cancers. Scientists have conducted a number of cancer studies. In the urban environment, it causes diseases not caused by exposure to previously unknown human environmental pollutants. [4].

According to experts from the World Health Organization [5], 23% of all diseases and 25% of all cancers are associated with environmental factors.

The negative impact of industrial production activities occurs mainly in two directions:

1) in the process of developing natural resources (such as minerals, land, forest, ocean resources);

2) During the production process. The mining industry is the main industry developing mineral natural resources. It causes the greatest damage to the environment during the extraction of various subsurface resources and their primary processing [6]

Environmental pollution is particularly severe during the operation of industrial enterprises. The thermal and electric power grid, which is the main energy system in the world, tends to pollute the Earth's groundwater, atmospheric and water shells with sulfur dioxide ($S0_2$), nitrous oxide (NO), carbon monoxide (CO), benzopyrene, and millions of tons of solids. The “merit" of coal-fired thermal power plants in this regard is especially great. For example, according to the data, such thermal power plants pollute the environment by 2 times with sulfate gas compared to stations running on petroleum products, and 100 times more compared to stations running on natural gas.

Today, the Samarkand region is one of the fastest growing regions of our republic, along with the development of industry, the amount of toxic gases released by industrial enterprises and transport is increasing. In particular, in the industrialized areas of the province, this creates various problems. Substances such as dust, sulfur dioxide, carbon dioxide, nitrous oxide, and phenols emitted by industrial enterprises and transport are considered harmful to the human body.[6]

The main part (89%) of pollutants released into the atmosphere without purification are gaseous: sulfur oxide, carbon monoxide, nitrous oxide, hydrocarbons and volatile organic compounds. The rest (11%) - solid particles (dust, soot, etc.) are formed during the production process.

The level of atmospheric air pollution depends on the number of vehicles, their normal operation, aeration of city streets, large and small number of plantings, climatic conditions of the air and other factors. Today, the number of cars in the Samarkand region is 387 thousand. Metabolic processes in the body are closely related to oxygen in the air. Along with this air, harmful dusts and gases polluting it enter the human body. How many harmful factors can enter the human body if, on average, a person breathes 16-18 times per minute? What diseases can be caused if they exceed the hygienic norm?

That is why in cities with high air pollution there is an increase in the incidence of various diseases of the respiratory tract, the human body as a whole: anemia, bronchitis, pneumonia, rhinitis and others. Nitrogen oxides in the air cause diseases of the respiratory tract, eyes, and throat in children, and sulfur gas exacerbates diseases of the organs of vision, respiration, and hearing. [7,8]

MATERIAL AND METHODS.

Study area.

The research was conducted in industrialized areas of the Samarkand region. The construction, transport, light, textile, and metallurgical industries are widely developed in the region. Today, Kattakurgan, Djomboy, and Urgut districts of the Samarkand region are among the most notable areas in terms of active production and processing. Along with the development of industry, the impact on the environment is also growing.

Enterprises selected for research and comparison based on the production potential of enterprises:

Following the example of the cement company “Hengguan Cement” LLC, located in Kattakurgan district, the cement company “Jambai Green Lanterns” LLC, located in Jambai district, and the “Urgut Textile Slate” enterprises, a study was conducted.

Methods. The theoretical basis of this study includes data from scientific works on the impact of industry on urban air pollution and human health. To achieve the goal of this study, empirical research methods were used, namely, empirical description (when recording data on urban air pollution and human health), as well as comparison (when comparing the impact of air pollution in industrial areas on human health). This study analyzes the indicators of pollutant emissions into the atmosphere by the Republic of Uzbekistan and regions. World Health Organization data [9] were used in writing the article. In addition, the study used official data from the State Statistics Committee of the Republic of Uzbekistan [10] for recording and analyzing data on air pollution and human health. Also, atmospheric air pollution was calculated using sanitary and epidemiological standards [11]. At a separate stage of the study, based on statistical data, the level of general morbidity observed

with cardiovascular diseases and respiratory diseases in 2021-2024 was studied using the example of the Samarkand region. This information is based on data from regional health departments and Centers for Sanitary and Epidemiological Surveillance.

Methods of statistical analysis, including time series analysis, were used to determine the state of atmospheric air. With the help of these methods, it was established that the level of pollution varies over the years and corresponds to health problems.

RESULTS. The Samarkand region differs from other regions in its more developed industry. According to the statistics agency, as of February 2024, 68,691 industrial enterprises are operating in Uzbekistan. Most of them are concentrated in Tashkent -11,930. Ferghana region is in second place with 7,635. Tashkent region rounded out the top three with 7,273, and Samarkand region took the fourth place with 5,416 industrial enterprises [10]. Of these, 61 are accounted for by large enterprises. [11].

Environmental hazard of objects the degree of danger is divided into types depending on the degree of environmental impact of objects, that is, the amount of pollutants released into the atmosphere, the formation of wastewater, and industrial waste. In particular, Cabinet of Ministers Resolution No. 949 dated November 22, 2018 “On Approval of the Regulation on State Environmental Assessment” provides a list of objects subject to state environmental assessment according to the degree of danger, divided into 4 categories depending on the danger of their impact on the environment. [4]. The collected data show that there are only 5,416 environmental impact sites in the Samarkand region.(diagram 1).

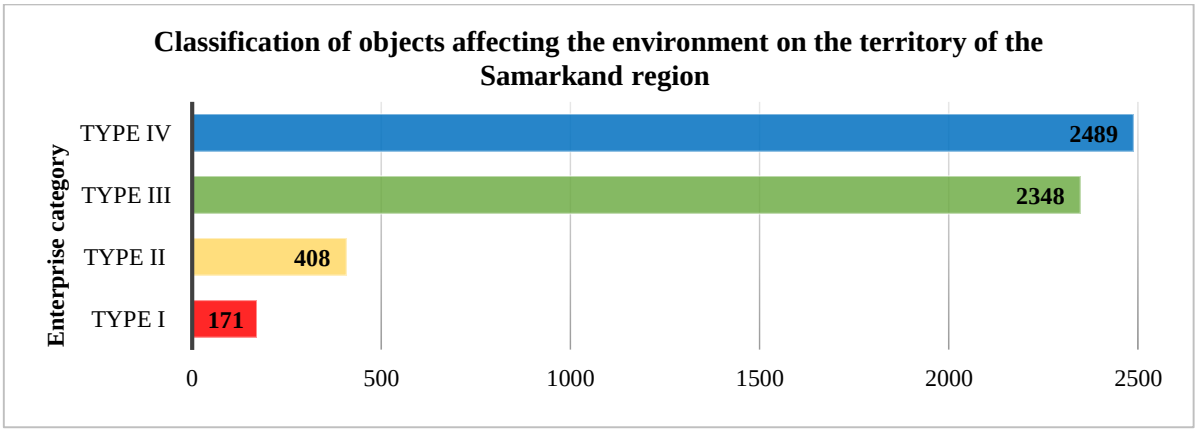

Diagram 1. The diagram was compiled by the author based on data from the Samarkand Regional Statistics Department.

In recent years, the economic development of Uzbekistan, the expansion of industry and the increase in car transport have exacerbated environmental problems, in particular, pollution of atmospheric air. In the Samarkand region, industrial zones are densely populated, this situation directly affects the health of the population. The results show that air pollution in the industrialized zones of the Samarkand region is inextricably linked with health problems. Especially cases of respiratory and heart disease are increasing sharply in areas with a high pollution index. There are 1.5–2 times more pollutants than the norms recommended by the WTO. In particular, today the Samarkand region has a population of about 4.3 million, making it the most populous province in the Republic. The Samarkand region is distinguished from other regions by the fact that industry is much more developed. According to the statistics agency, the Samarkand region, on the other hand, has 5,416 industrial enterprises, of which 61 are accounted for by large enterprises. [10], [11]. The Samarkand region is distinguished from other regions by the fact that industry is much more developed. According to the statistics agency, the Samarkand region, on the other hand, has 5,416 industrial enterprises, of which 61 are accounted for by large enterprises. [10], [11]. Today, the Samarkand region has more than 380,000 vehicles, of which more than 354,758 or 93.4% belong to the private sector, and more than 24,951 or 6.6% to public sector vehicles. As a result of the movement

of these vehicles, 103,526 tons of pollutants are released into the atmosphere annually. The total amount of pollutants released into the atmosphere in the Samarkand region in 2024 amounted to 52.3 thousand tons. It was found that this amount is 34% more than in 2023. (diagram 2).

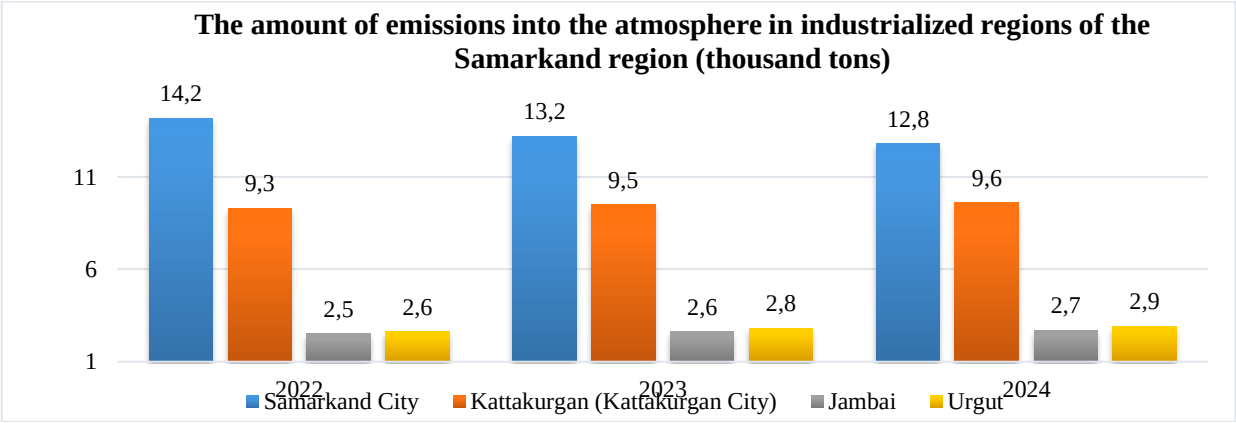

Diagram 2. The diagram was compiled by the author based on data from the Samarkand Regional Statistics Department.

According to the observations, the annual capacity of "Hengguan Cement" LLC cement plant, located in Kattakurgan district, is 2.7 million tons. The main fuels for production are natural gas and coal. The use of coal alone is 472 thousand tons per year.

For reference: when burning 10 tons of coal, 220 kg of soot, 360 kg of sulfur II oxide, 64 kg of carbon monoxide, 16 kg of nitrogen II oxide and 2 tons of ash are released into the atmosphere.

The main components of the pollution of the territory's atmosphere are released from the cement production plant: cement dust, inorganic dust, carbon monoxide, nitrous oxide, hydrocarbon, benz(a)pyrene.

The main components of pollution of the territory where the enterprise is located are: cotton dust, carbon monoxide, nitrogen oxide, inorganic dust, gypsum dust, hydrocarbons, welding dust (iron oxide), manganese oxide and benzapyrene, cement dust, inorganic dust, welding dust, manganese oxide released into the atmospheric air during concrete production, inorganic dust, welding dust, manganese oxide, in the asphalt production workshop, asphalt production releases inorganic dust, carbon monoxide, nitrous oxide, benz(a)pyrene, and hydrocarbon released into the atmospheric air.

Data and empirical analysis show that 6893.24 tons of 17 types of pollutants are released from the enterprise into the atmospheric air per year. The main part of them are carbon monoxide, sulfur oxide, nitrogen dioxide, nitrit oxide, inorganic dust, silicon oxide and iron oxides. In addition, about 93,000 tons of the substance per year are captured through dust collection devices. (diagram 3)

The supply of inorganic dust, on the other hand, includes both mineral and metallic dust. Metal dust is formed, for example, by an electric gas flame, which during the welding process joins the smoke in the air to form aerosols. In the air of industrial premises of construction enterprises, 70-80% are dust particles up to 5 microns in size. The design sanitary standards of industrial enterprises establish the maximum permissible dust content in the air of industrial enterprises. For example, the amount of dust in a room should be 1 mg/m^3 when the free silica content in the air exceeds 70%, and 2 mg/m^3 when the silica content is 10-70%, and 3-4 mg/m^3 when the dust content is less than 10%. [1,15]

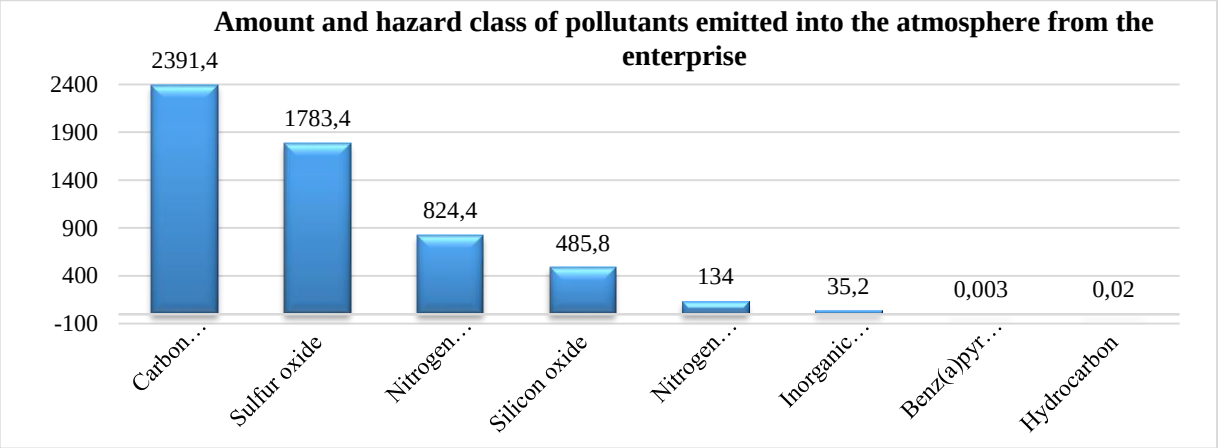

Diagram 3 The diagram was compiled by the author based on data from the Samarkand Regional Statistics Department.

Our other research work was carried out at the cement production plant of LLC “Jambai Green Lanterns”, located in the Jambai district.

The cement production company ”Jambai Green Lanterns" LLC is located in the village of Farhad, Jambai district. The main activity of the enterprise is the production of cement with an annual capacity of 180 thousand tons. The total area of the enterprise is 7.36 hectares. There are agricultural lands in the north, “Construction of Zarafshan Water SOGDA” LLC in the east, a highway in the south, and the territory of “RISO Production Business” LLC in the West. The nearest settlement is located at a distance of about 300 m in a northeasterly direction. This does not comply with sanitary standards and rules for the protection of atmospheric air in populated areas of the Republic of Uzbekistan.

Coal and natural gas are mainly used as fuel in cement production. It is worth mentioning here that the use of coal fuel significantly changes the emissions of carbon monoxide, sulfur oxide, and nitrogen dioxide.

46 types of pollutants are released into the atmospheric air from the enterprise, and 18 from stationary sources. The total amount of pollutants released into the atmosphere is 319.08 tons per year [diagram 4.]

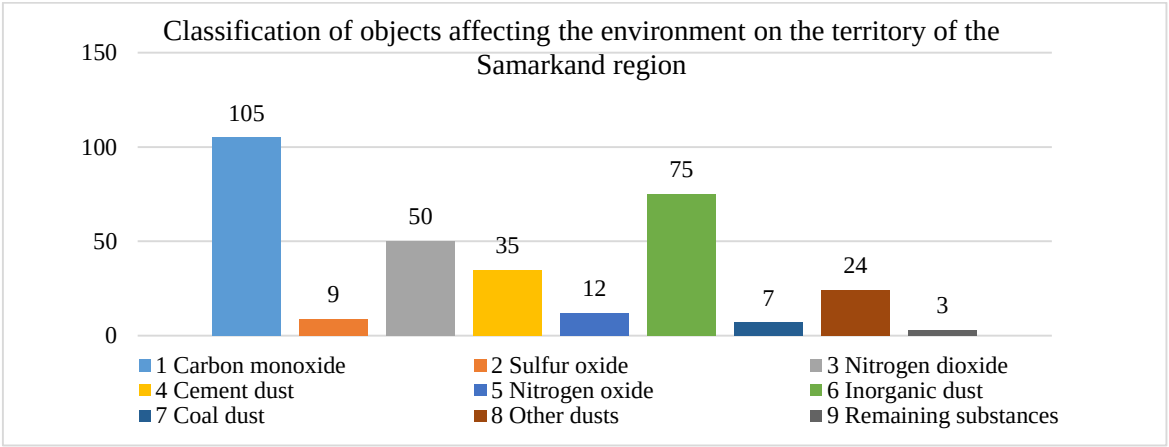

Diagram 4 The diagram was compiled by the author based on data from the Samarkand Regional Statistics Department.

The limited Liability Company ”URGUT TEXTILE SLATE" is located on the territory of the makhalla of soils of the Urgut district of the Samarkand region. The total land area of the enterprise is 4.72 hectares.

The village of Kayrakly is located 350 meters to the northwest, the village of Sanchikul is 900 meters to the northeast, and the village of Khojak is 500 meters to the south. The annual capacity of the enterprise is designed to produce 696.7 thousand pieces of slate.

The limited liability Company ” URGUT TEXTILE SLATE” is included in the list of Category 1 facilities in accordance with paragraph 26 of Appendix 2 to Resolution No. 949 of the Cabinet of Ministers of the Republic of Uzbekistan dated November 22, 2018. "On approval of the Regulations on the State Environmental Expertise". In the production technological process of the enterprise, the volumes of pollutants for each source of pollutants into the atmosphere are determined separately and in full for the enterprise.

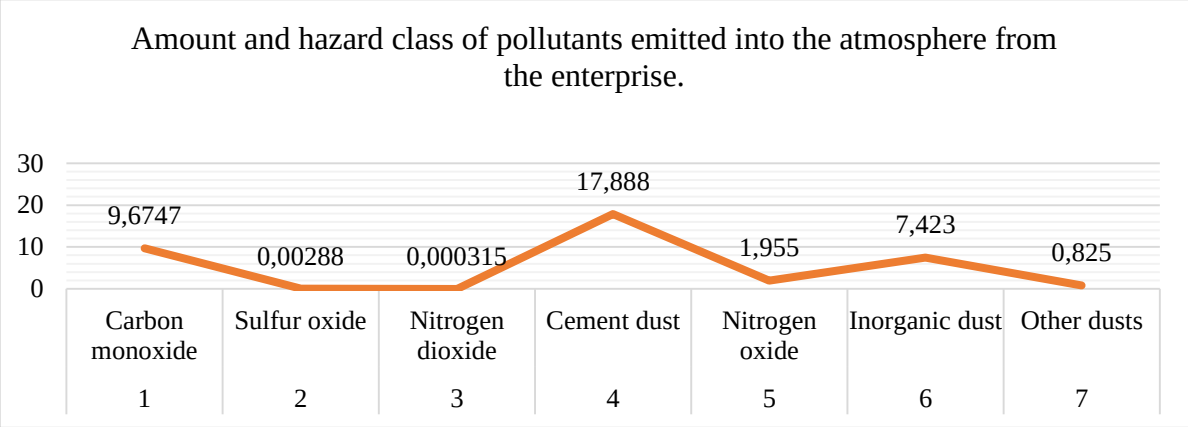

Diagram 5. The diagram was compiled by the author based on data from the Samarkand Regional Statistics Department.

Limited Liability Company ”URGUT TEXTILE SLATE". Devices and equipment for the separation of pollutants–23 pcs. Sources of pollutant emissions -21 of them: organized sources - 10, unorganized sources-11. Pollutants released into the atmospheric air at an enterprise from sources of pollutant emissions are of 11 types, with a gross volume of 37.768277 tons/year. (diagram 5)

It is worth mentioning here that atmospheric air pollution directly affects human health. Many studies show that carbon monoxide, nitrogen oxides, sulfur oxide and other toxic compounds cause respiratory and cardiovascular diseases. According to the WHO (World Health Organization), 7 million people a year die prematurely as a result of diseases associated with atmospheric pollution [11].

In the industrially developed (Samarkand, Kattakurgan, Urgut, Jambai) districts of the Samarkand region, atmospheric air pollution does not remain without consequences for human health. In particular, the statistics on the incidence of respiratory diseases and cardiovascular diseases in these areas are presented. Statistical data show that Kattakurgan district has a higher incidence of respiratory diseases. This is due to the geographical location of the area, the direction of the wind, and other abiotic factors that cause a higher incidence of these diseases in the area.

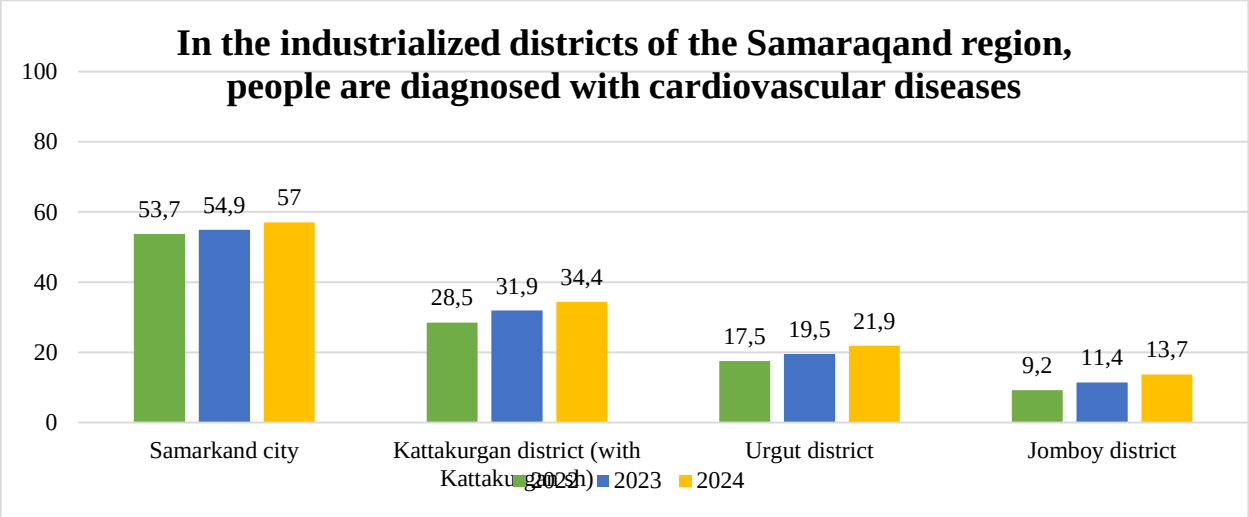

Diagram 7. The diagram was compiled by the author on the basis of the statics of the Health Department of the Samarkand region

The city of Samarkand is the regional center and the most industrially developed region in the area. The population of the city of Samarkand is growing year by year. According to the Samarkand Statistics Department, today the city's population is 595.8 thousand people. The growth rate of the population is about 2%. The main sources of air pollution in Samarkand are transport and large industrial enterprises. The population density of Samarkand is 4,945 people per 1 km2. In total, there are about 370 thousand cars in the Samarkand region, most of which are in the city of Samarkand. Notably, in the city of Samarkand, the pollution of motor vehicles is more than 70 percent, and if cars switch to gas operation in order to reduce harmful gases released into the atmosphere, the pollution will be relatively reduced.

According to the Regional Committee on Climate Change and Environmental Protection, the air in Samarkand is being polluted with dust, nitrogen, chlorine, carbon monoxide, hydrogen fluoride, phenol, and other harmful wastes. Therefore, in cities with extremely polluted air, there is an increase in various diseases of the respiratory tract and the human body as a whole: anemia, bronchitis, pneumonia, rhinitis, etc. Along with pollution and population growth, there is also an increase in respiratory diseases and cardiovascular diseases in Samarkand.

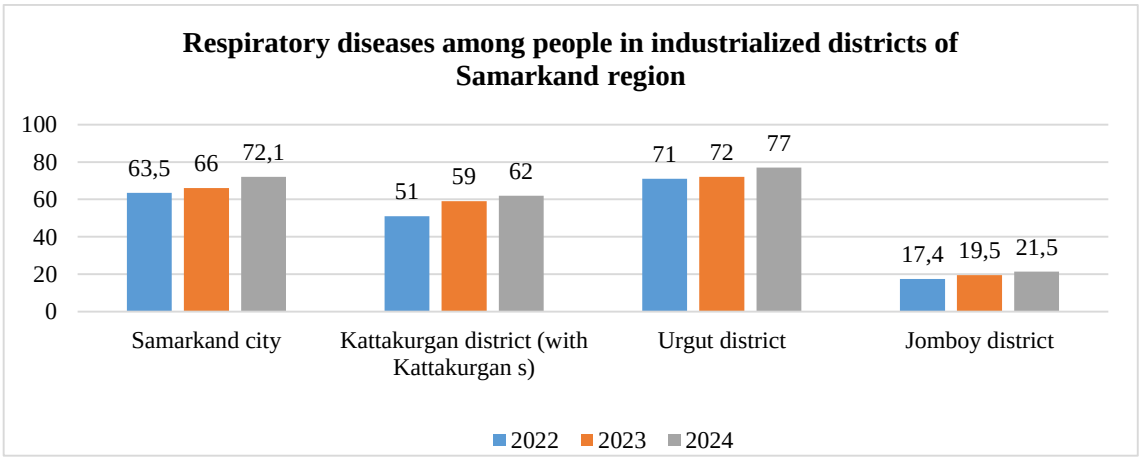

Diagram 6. The diagram was compiled by the author on the basis of the statics of the Health Department of the Samarkand region

According to statistics, in 2022, the number of people with respiratory diseases of varying degrees in the city of Samarkand was 63.5 thousand people per 100,000 people, while the number of people with cardiovascular diseases was 53.7 thousand per 100,000 people. This was 63.5% and

53.7% of the total population, respectively. In 2023, the number of people with respiratory diseases was 66.2 thousand per 100 thousand people and constituted 66.2% of the total population. Cardiovascular diseases amounted to 54.9 thousand people, and 54.9% of the total population suffered from a certain type of this disease. It should be noted that in 2024, the number of people with respiratory diseases was 72.1 thousand people per 100 thousand people, which is 72.4% of the total population, and cardiovascular diseases were 57.0 thousand people, which is 57% of the total population. The year-on-year increase in morbidity can be explained by the increasing number of cars in the city, the construction of many new industrial enterprises, and the noise level of the urban ecosystem.

Kattakurgan district is one of the largest productive industrial regions of the area. At the same time, the amount of harmful substances emitted into the atmosphere from industrial enterprises in the district is also high. As a result of toxic gases emitted by industrial enterprises and vehicles, respiratory diseases of varying degrees are encountered among the population.

The population of the district in 2024 will be 390.1 thousand people. Harmful compounds from industrial enterprises cause various respiratory and cardiovascular diseases in humans. The studied materials show that respiratory diseases of the population in the district in 2022 amounted to 54.1 thousand people per 100 thousand people and constituted 54.1% of the total population of the district. Cardiovascular diseases amounted to 28.5 thousand people per 100 thousand people, which is 28.5% of the district's population. In 2023, this figure was 56.8 thousand people per 100,000 people. This represented 56.8% of the total population of the district. Cardiovascular diseases accounted for 31.9 thousand people, which is 31.9% of the district's population. In 2024, 61.8 thousand people per 100,000 people suffered from various respiratory diseases, which amounted to 61.8% of the total population. Cardiovascular diseases amounted to 34.4 thousand people per 100 thousand people, which is 34.4% of the district's population. The main reason for this can be explained by the increase in the number of industrial enterprises. As a result of toxic gases emitted by industrial enterprises and vehicles, various respiratory diseases are encountered among the population.

Urgut district is one of the largest manufacturing and industrial places of the region. There is also an economic zone in this area. At the same time, the amount of harmful substances emitted into the atmosphere from industrial enterprises in the district is also high. As a result of toxic gases emitted by industrial enterprises and vehicles, various respiratory diseases and cardiovascular diseases are also encountered among the population.

The district's population reached 595.8 thousand people in 2024. Statistical analysis of materials shows that respiratory diseases of the population in the district in 2022 amounted to 50.6 thousand people per 100 thousand people. This was 50.6% of the district's population. The number of people with cardiovascular diseases was 17.5 thousand people per 100 thousand people, which is 17.5% of the total population of the district. In 2023, this figure was 51.8 thousand and 19.5 thousand people per 100,000 people, respectively, and the share of infected was 51.8% and 19.5%. In 2024, 57.8 thousand people per 100,000 people suffered from various respiratory diseases, which constituted 57.8% of the total population. The number of people with cardiovascular diseases was 21.9 thousand per 100 thousand people, and the share of those infected was 21.9%. The main reason for this is the establishment of a free economic zone in the region, which can be explained by the large number of light and construction industry enterprises and various toxic gases emitted from them.

Jomboy district is one of the largest manufacturing and industrial areas of the region. At the same time, the amount of harmful substances emitted into the atmosphere from industrial enterprises in the district is also high. As a result of toxic gases emitted by industrial enterprises and vehicles, various respiratory diseases and cardiovascular diseases are also encountered among the population. The population of the district in 2024 will be 190.6 thousand people. Due to population density, harmful compounds emitted by industrial enterprises cause various respiratory diseases in humans. Statistical analysis shows that the respiratory diseases of the population in the district in 2022 amounted to 17.4 thousand people per 100,000 people. This was 17.4% of the district's population. The number of people with cardiovascular diseases was 9.2 thousand people per 100 thousand people, and the share of those infected was 9.2%. In 2023, this figure was 19.5 and 11.4 thousand people per

100,000 people. This is 19.5% and 11.4% of the total population of the district. In 2024, 21.5 thousand people per 100,000 people suffered from various respiratory diseases, which constituted 21.5% of the total population. The number of people with cardiovascular diseases was 13.7 thousand people per 100 thousand people, and the share of those infected was 13.7%. The main reason for this can be explained by the growth of industrial enterprises. As a result of toxic gases emitted by industrial enterprises and vehicles, various respiratory and cardiovascular diseases are encountered among the population (diagram 6-7).

DISCUSSION. In order to reduce emissions into the atmosphere, it is necessary to centralize aeration systems with the construction of highly effective means of purifying exhaust gases, including the modernization and replacement of outdated purification equipment with new ones, the introduction of new technological schemes, the introduction of methods for reducing the formation of harmful substances, the liquidation of small boiler houses, the development and implementation of automated systems for managing and controlling emissions of pollutants into the atmosphere, the use of new foreign technologies for measuring pollutants in the atmosphere, as well as a reduction in emissions by 60-65% by 2025. It is necessary to increase the number of tree plantations and green avenues in cities and industrial centers. Our scientists recommend planting green trees in two sides of the main streets and residential buildings. Considering that the largest amount of atmospheric air pollution is attributed to motor vehicles, in order to reduce the emission of toxic gases from them, it is necessary to stop the production of gasoline-powered vehicles in our republic and establish the production of electric vehicles, develop public transport, increase the efficiency of dust and gas cleaning equipment at industrial enterprises, replace the old one with a new one, and expand green areas.

Ways to improve the ecological situation in the country and the main strategic goals of the Republic of Uzbekistan in the field of environmental protection and rational use are:

creation of favorable conditions for the health of the population, maintaining the balance of the biosphere;

The main direction of atmospheric air protection is improving the quality of atmospheric air in cities and settlements with subsequent observance of sanitary and hygienic rules, for which it is necessary to reduce emissions in all regions of the republic, create low-waste technologies, create new dust collection and cleaning equipment and increase the efficiency of their production, and replace obsolete equipment with new ones. [15.]

Currently, the number of factories and plants, road transport, and the population are growing year by year. The area of forests and green meadows is decreasing. This, in turn, leads to the accumulation of "greenhouse gases" in the atmospheric air, which should be absorbed by plant leaves. This can cause an increase in temperature on the ground [7].

Systemic measures are also being taken for landscaping, protecting trees and shrubs, expanding and preserving green spaces.

The "Uzbekistan 2030" Strategy, aimed at sustainable development, also pays special attention to environmental protection, including atmospheric air, and greening of territories [17].

Recommendations: to improve the quality of atmospheric air in cities, it is necessary to implement systematic and scientifically based measures aimed at reducing emissions of pollutants. Modern ecological research confirms that these anthropogenic sources - industrial enterprises, vehicles, and energy facilities - are the main factors of air pollution in urbanized areas. In this regard, the following priority measures are necessary:

- Optimization of transport infrastructure: transition to environmentally friendly transport (electric vehicles, hybrid and hydrogen systems), strengthening toxic emission standards, introducing smart transport systems to reduce traffic congestion and pollution levels.
- The development of an environmental monitoring system, including automatic air quality monitoring stations, taking into account meteorological conditions, will ensure adequate assessment and forecasting of the risk of exceeding MPCs (permissible maximum concentrations).

- Control of the effectiveness of treatment facilities and compliance with technological regulations for the capture and neutralization of harmful impurities, implementation of modern filtration systems with the participation of regulatory bodies.
- Limiting waste in adverse weather conditions, controlling the forced cessation or decrease in production intensity during periods when the spread of pollutants is difficult (settling, temperature inversion, etc.).

CONCLUSIONS

Observations show that especially in highly urbanized districts (Samarkand City, Kattakurgan, Urgut, Jambay), the concentrations of particles such as SO_2, NO_x, and CO exceed the current hygienic standards. Atmospheric pollution is causing not only environmental, but also serious medical problems. During the research, a statistical correlation was identified between air pollution and respiratory diseases, cardiovascular disorders, and allergic reactions. Such diseases are particularly common among children and the elderly, and living in densely industrialized areas is the main risk factor for them.

Studies indicate that the population living in the industrialized areas of the Samarkand region is exposed to a high level of environmental risk. The degree of atmospheric air pollution poses a serious threat to public health. To address this issue, a comprehensive approach is required, including strengthening the analysis and monitoring system and enhancing cooperation between the government and the public.

According to the research results, it is necessary to strengthen environmental monitoring, introduce technological modernization aimed at reducing industrial emissions, and develop regional environmental safety programs that operate in continuous collaboration with the healthcare system. Complex measures in this direction play an important role not only in protecting the environment, but also in safeguarding public health.

Rezyume: *Ushbu tadqiqot Samarqand viloyatining sanoatlashgan hududlarida atmosfera ifloslanishi, uning aholi salomatligiga ta’siri va natijada yuzaga kelayotgan ekologik muammolarni o‘rganishga qaratilgan. Hududlardda sanoat tarmoqlarining rivojlanishi bilan havoga zararli moddalarning chiqarilishi ortib bormoqda, bu esa havo sifatining yomonlashuviga va mahalliy aholining salomatligiga salbiy ta’sir ko‘rsatmoqda. Sanoat korxonalari, transport vositalari hamda boshqa antropogen faoliyatlar ifloslanishning asosiy manbalaridir. Ushbu omillar havo sifatining pasayishiga sabab bo‘lib, aholida nafas olish tizimi kasalliklari, allergiya, astma va boshqa salomatlik bilan bog‘liq muammolarning ko‘payishiga olib kelmoqda. Ushbu maqolada Samarqand viloyatida ekologik jihatdan barqaror sanoat amaliyotlarini rivojlantirish muhim bo‘lib, ushbu maqolada hududning ekologik va sanitariya holatini yaxshilashga qaratilgan asosiy tavsiyalar berilgan.*

Резюме: *Данное исследование направлено на изучение загрязнения атмосферного воздуха в индустриализированных районах Самаркандской области, его воздействия на здоровье населения и возникающих в результате экологических проблем. С развитием промышленных отраслей в регионе выбросы вредных веществ в атмосферу увеличиваются, что приводит к ухудшению качества воздуха и негативно сказывается на здоровье местных жителей. Основными источниками загрязнения являются промышленные предприятия, транспортные средства и другие антропогенные виды деятельности. Эти факторы приводят к снижению качества воздуха и росту заболеваний дыхательной системы, аллергии, астмы и других проблем, связанных со здоровьем. В статье подчеркивается важность развития экологически устойчивых промышленных практик в Самаркандской*

области и представлены основные рекомендации, направленные на улучшение экологической и санитарной обстановки региона.

STUDY OF THE (*CARYOPHYLLACEAE)* FAMILY INCLUDED IN THE RED BOOK OF THE REPUBLIC OF UZBEKISTAN

Qarshiboyeva N.H.
Jizzakh State Pedagogical University
E-mail: q.nasiba1969@gmail.com

Summary: *The new edition of the Red Book of the Republic of Uzbekistan includes 329 plant species belonging to 48 families. Ten species belonging to the family Caryophyllaceae are included in the Red Book. The species found in the Molguzar, Turkestan and Nurota mountain ranges of the Jizzakh region were analyzed according to literature sources. These include species such as Kachimsimon yetmak (bex) – Allochrusa gypsophiloides, mountain silena – Silene oreina, and glandless silena – Silene paranadena. A table was compiled for species belonging to the Caryophyllaceae family.*

Key words: *Red Book, Caryophyllaceae family, protection, endemic, life forms.*

The conservation of plant diversity has great vital importance for humanity. On December 3, 2004, the laws “On Protected Natural Areas,” on September 21, 2016, the law “On the Protection and Use of Plant Resources,” and on April 16, 2018, the law “On Forests” were adopted in a new edition. These laws are important documents for preserving all plant species, protecting them, and ensuring their conservation. [3] According to the 2019 edition of the Red Book, 329 plant species of Uzbekistan’s flora are considered at risk of extinction. Specialists and scientists of the Republic continuously study their current status. Their observations show that the number and distribution of some species have significantly increased. [5] According to data from 2009, 321 plant species were included in the Red Book [1], while the 2019 edition contains 329 species belonging to 48 families. [3] Among these, ten species belong to the Caryophyllaceae family. A table was compiled for species of the Caryophyllaceae family included in the Red Book. The table provides extensive information such as local and scientific names, rarity status, distribution area, life form, and conservation measures. A description of the family was given. Based on literature, descriptions of some species were provided, and their conservation measures were studied. Caryophyllaceae — a family belonging to the order Caryophyllales. It includes subshrubs, as well as annual, biennial, and perennial herbs. The family comprises about 2000 species belonging to 80 genera. In Uzbekistan, 122 species belonging to 24 genera grow. The leaves are simple, opposite, sessile, with entire margins. The flowers are regular, 4–5-lobed. The calyx may be free or fused. Stamens number 4–10, carpels 1–5, the ovary is superior, and the fruit is a capsule. The family is widespread mainly in the temperate regions of the Northern hemisphere. Species such as Dianthus, Silene, Lychnis, Saponaria and others are ornamental. The roots of species like Gypsophila, Acanthophyllum, Onosma and others are used in the preparation of halva and various beverages. Some species of the Caryophyllaceae family are used in the perfumery industry and medicine. Ten species of Caryophyllaceae are included in the Red Book of the Republic of Uzbekistan. [4]

Table 1. Species of the Caryophyllaceae Family Included in the Red Book of the Republic of Uzbekistan

Uzbek name	Scientific name	Rarity status	Height	Distribution	Life form	Conservation measures
1. Kachimsimon yetmak (bex)	Allochrusa gypsophiloides (Regel) Schischk.	3 – endemic	30–60 cm	Tashkent, Samarkand, Namangan, Jizzakh	Perennial herb	Protected in Surkhan, Kitab, and Chatkal reserves

2.Michelson's silene	Silene michelsonii Preobr.	1 endemic	25–30 cm	Surkhandarya	Perennial herb	Conservation measures not developed
3.Woolly silene	S. tomentella Schischk.	2 – endemic	30–40 cm	Bukhara, Navoi	Perennial herb	Not specially protected
4.Popov's silene	S. popovii Schischk.	2 – endemic	20–25 cm	Samarkand, Kashkadarya, Zarafshan	Perennial herb	Not under special protection
5.Mountain silene	S. oreina Schischk.	1 – endemic	10–15 cm	Samarkand, Kashkadarya, Zarafshan Range	Perennial herb	No special conservation measures
6.Natalia's silene	S. nataliae F.O.Khass.	1 – endemic	3–5 cm	Surkhandarya	Subshrub	Protected in Surkhan Reserve
7.Glandless silene	S. paranadena Bondarenko et Vved.	2 – endemic	30–50 cm	Nurota–Molguzar Ranges (Samarkand, Navoi, Jizzakh)	Perennial herb	Protected in Nurota State Reserve
8.Needle-like white-thorn	Acanthophyllum albidum Schischk.	3 – endemic	30 cm	Fergana, Namangan	Subshrub	Strict protection recommended
9.Awl-leaf white-thorn	A. cyrtostegium Vved.	3 – endemic	20–30 cm	Bukhara, Navoi	Subshrub	Monitoring of populations necessary
10.Uzbekis-tan carnation	Dianthus uzbekistanicus Lincz.	3 – endemic	40 cm	Samarkand, Kashkadarya	Perennial herb	Some populations protected in Kitab State Reserve

Descriptions of Selected Species

1. Kachimsimon yetmak — *Allochrusa gypsophiloides* (Regel) Schischk. A perennial herb, 30–60 cm tall. Stems thin and numerous. Leaves 10–25 mm long, flat, glabrous, and spineless. Flowers pink, arranged in spreading paniculate inflorescences at the top of the stem. Fruit a capsule. Flowering occurs from May to August; fruits ripen in August–September.

2. Mountain silene — *Silene oreina* Schischk. A perennial, many-headed (caudex-forming), densely tufted herb, 10–15 cm tall. Leaf tips elongated and very sharp, covered with dense glandular hairs. Basal leaves are oblanceolate, narrowing toward the base; stem leaves are broader. Flowers white, 1–3 per stem tip. Calyx 2–3 times longer than the corolla, initially cylindrical, later campanulate. Carpophore glabrous. Capsule ovoid. Flowers in May; fruits ripen in May–June.

3. Glandless silene — *Silene paranadena* Bondarenko et Vved. Perennial herb, 30–50 cm tall; stems numerous, woody at the base. Leaves lanceolate, 3–6 cm long, 10–12 mm wide. Flowers solitary at branch tips, large, 30–32 mm long. Petals white to pale pink, deeply bifid. Calyx cylindrical, non-inflated, 22–25 mm long; tube glabrous; teeth with white hairs. Fruit a capsule 10–12 mm long. Flowers April–June; fruits ripen in June. Distribution Notes According to literature sources, the species Allochrusa gypsophiloides, Silene oreina, and Silene paranadena occur in the Molguzar, Nurota, and Turkestan ranges of Jizzakh region. [5, 6]. In the 2009 edition, Allochrusa tadschikistanica Schischk. (Tajik yetmak) was included; however, it is absent from the 2016 and 2019 editions, indicating that the species has likely increased in number or been restored. Dianthus uzbekistanicus Lincz. (Uzbekistan carnation) was not included in the 2009 edition but is present in the 2019 edition, indicating that its population has declined in recent years.

Conclusions 1. In the 2019 edition of the Red Book of the Republic of Uzbekistan, 329 plant species were included. Among them, 10 species belong to the family *(Caryophyllaceae*).

2.The species *Dianthus uzbekistanicus* (3 – endemic) was included in the 2019 edition. This indicates that the species is currently decreasing in number 3. The species *Allochrusa tadschikistanica*

(3 – endemic) was included in the 2009 edition but omitted from the 2019 edition. This suggests that the species has increased in number or has been successfully propagated. 4.Protecting the species included in the Red Book of the Republic of Uzbekistan, including those belonging to the Caryophyllaceae family, is of great importance for humanity.

ON THE SOLUTION OF SOME NONLINEAR EQUATIONS OF MATHEMATICAL PHYSICS BY THE METHOD OF VARIABLE SEPARATION

Shamsiev D.N.
Tashkent State Technical University

Summary: *The article deals with a two-dimensional equation that includes nonlinearity by first derivatives. Using the method of variable separation, solutions of nonlinear equations of mathematical physics containing homogeneous functions of the first order from derivatives are obtained. Analysis of solutions for some special cases is carried out.*

Keywords: *differential equation, mathematical physics, homogeneous function, variable separation method, partial derivative.*

In modern mathematical physics and its applications, one of the most important methods is the method of variable separation (VS), which is successfully used to solve partial differential equations [1]. In this work, this method is applied to the solution of equations containing homogeneous functions of the first order from derivatives.

Consider an equation relative to an unknown function of three unknowns $u(t,x,y)$

$$Lu = F\left(\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}\right) \tag{1}$$

$L \equiv \sum_{k=1}^{M} \varphi_m(t) \frac{\partial^m}{\partial t^m}$ - linear differential operator by variable t; F a known homogeneous function with respect to its arguments [2].

According to the method of dividing variables [1], we will look for the solution of equation (1) in the form

$$u(t,x,y) = \varphi(t) + \psi(t)g(x,y). \tag{2}$$

where $\varphi(t), \psi(t), g(x,y)$ unknown functions to find.

Substitute function (2) in (1), then

$$L\varphi(t) + g(x,y)L\psi(t) = \psi(t)F\left(\frac{\partial g}{\partial x}, \frac{\partial g}{\partial y}\right)$$

or

$$\frac{L\varphi(t)}{\psi(t)} + \frac{L\psi(t)}{\psi(t)} g(x,y) = F\left(\frac{\partial g}{\partial x}, \frac{\partial g}{\partial y}\right) \tag{3}$$

Next, let's consider the following special cases:

$$1) \quad \frac{L\psi(t)}{\psi(t)} = \lambda \neq 0\,. \tag{5}$$

Then out of (3) we have

$$\frac{L\varphi(t)}{\psi(t)} = F\left(\frac{\partial g}{\partial x}, \frac{\partial g}{\partial y}\right) - \lambda g(x,y) \tag{6}$$

The left and right sides of this equation are functions of different variables, so they are equal to a certain constant μ. Accordingly, we get the equations

$$L\varphi(t) = \mu\psi(t)\,, \tag{7}$$

$$F\left(\frac{\partial g}{\partial x},\frac{\partial g}{\partial y}\right)=\lambda g(x,y)+\mu\,. \tag{8}$$

After replacement $q(x,y)=g(x,y)+\frac{\mu}{\lambda}$, equation (8) is converted to the form

$$F\left(\frac{\partial q}{\partial x},\frac{\partial q}{\partial y}\right)=\lambda q(x,y)$$

Further, due to the homogeneity of the function F we have

$$F\left(\frac{1}{q(x,y)}\frac{\partial q}{\partial x},\frac{1}{q(x,y)}\frac{\partial q}{\partial y}\right)=\lambda$$

or

$$F\left(\frac{\partial \ln q}{\partial x},\frac{\partial \ln q}{\partial y}\right)=\lambda \tag{9}$$

We will look for the solution of this equation in the form of an exponential function

$$q(x,y)=e^{k(c_1x+c_2y)}. \tag{10}$$

A simple substitution can make sure that $k=\frac{\lambda}{F(c_1,c_2)}$. Thus

$$q(x,y)=e^{\frac{\lambda}{F(c_1,c_2)}(c_1x+c_2y)},$$

or

$$g(x,y)=e^{\frac{\lambda}{F(c_1,c_2)}(c_1x+c_2y)}-\frac{\mu}{\lambda},$$

2) $L\psi(t)=0.$ (11)

Then

$$\frac{L\varphi(t)}{\psi(t)}=F\left(\frac{\partial g}{\partial x},\frac{\partial g}{\partial y}\right) \tag{12}$$

or

$$\frac{L\varphi(t)}{\psi(t)}=\lambda \tag{13}$$

$$F\left(\frac{\partial g}{\partial x},\frac{\partial g}{\partial y}\right)=\lambda \tag{14}$$

Here, equation (14) is similar to equation (9) and its solution would be the function

$$g(x,y)=\frac{\lambda}{F(c_1,c_2)}\left(c_1x+c_2y\right).$$

At $\lambda=0$ in the first and second cases, by solving the equation

$$F\left(\frac{\partial g}{\partial x},\frac{\partial g}{\partial y}\right)=0$$

due to the homogeneity of the function F, there will be an arbitrary differentiable function $f\left(c_1x+c_2y\right)$ for the coefficients of which the condition must be met $F(c_1,c_2)=0.$

Functions $\varphi(t)$ and $\psi(t)$ in the first case, we find from equations (5) and (7), in the second case, from equations (11) and (13). And the general solution in each case is found by formula (2).

Example. Consider the equation

$$\frac{\partial u}{\partial t} = \sqrt{a\left(\frac{\partial u}{\partial x}\right)^2 + b\left(\frac{\partial u}{\partial y}\right)^2}.$$

According to the above method, in the first case

$$u(t,x,y) = r_0 c_0 e^{\lambda t} + c_0 e^{\lambda t}\left(e^{\frac{\lambda}{\sqrt{ac_1^2+bc_2^2}}(c_1x+c_2y)} - r_0\right),$$

in the second case

$$u(t,x,y) = \lambda t + c_0 + \frac{\lambda}{\sqrt{ac_1^2+bc_2^2}}\left(c_1x + c_2y\right),$$

at $\lambda = 0$ we get

$$u(t,x,y) = f\left(c_1x + c_2y\right).$$

In here $r_0, c_0, c_1, c_2, \lambda -$ arbitrary constants, f voluntary differentiable function.

GEOLOGICAL STRUCTURE OF THE ALTYNTAU KAOLIN DEPOSIT IN CENTRAL KYZYLKUM

Mirzayev A.U[1]., Yusupov H.R[1]., Toshtemirov Sh.A[2].
[1]Navoi Branch of the Academy of Sciences,
[2]National University of Uzbekistan named after Mirzo Ulugbek

Summary: *The Altyntau kaolin deposit in the Central Kyzylkum region represents a unique geological and industrial site, the study of which is important for both fundamental and applied geology. The article highlights the deposit's geological structure, lithology, tectonics, mineralogy, geochemistry, and industrial evaluation. It emphasizes the genetic features of kaolin formation, their distribution within the weathering crust, and industrial applicability, as well as provides recommendations for further research, including associated minerals and rare-earth elements.*

Key words: *Kaolin, weathering crust, granitoids, mineralogy, geochemistry, prospective resources, rare earth elements, Altyntau, Uzbekistan.*

INTRODUCTION.

The "Altyntau" kaolin clays deposit, located in the western part of Uzbekistan, is a unique geological object with high industrial potential. Kaolin is used in the ceramic, refractory, paper, and rubber industry. Studying the geological structure, mineralogical composition, and predicted resources is crucial for the rational development of the deposit. The kaolinization of rocks is due to the interaction of geochemical processes, hydrothermal fluids, and tectonic activity. The work examines the features of the formation of primary and secondary kaolins, their placement in various morphological and stratigraphic complexes, and provides a predictive assessment of their reserves and industrial significance [1].

Degree of study of the problem and research methods. Geological study of the area began in the 1930 s. In 1953, a 1:100000 scale state survey was conducted, and in 1961, a geological map was published. In 1970-1974, a 1:50000 scale survey was carried out, which allowed for detailed dissection of sedimentary-metamorphic rocks and igneous complexes.

The first information about ancient weathering crusts dates back to the 1940s, and their systematic study began in the 1960s. It was shown that thick kaolin crusts formed during the pre-glacial period. In 1970-1977, Uzbekistan's territory was regionalized for the preservation of weathering crusts, and a map of their distribution was compiled, where linear and area types were identified, and a mineralogical-chemical characterization was provided.

In 1994, the "Химгеолнеруд" expedition prepared a report on the study of kaolin clays and the assessment of refractory and ceramic raw materials of the Altyntau massif [2-3].

Geological structure of the deposit. The "Altyntau" deposit is located on the southern slope of the Zirabulak gorst-anticlinorium within the Zeravshan-Turkestan zone. It is confined to granites of the Late Paleozoic complex, which have undergone deep kaolinization. The geological structure is complicated by a system of submeridional and sublatitudinal faults that control the depth of kaolinization and fragment the usable layer into individual blocks.

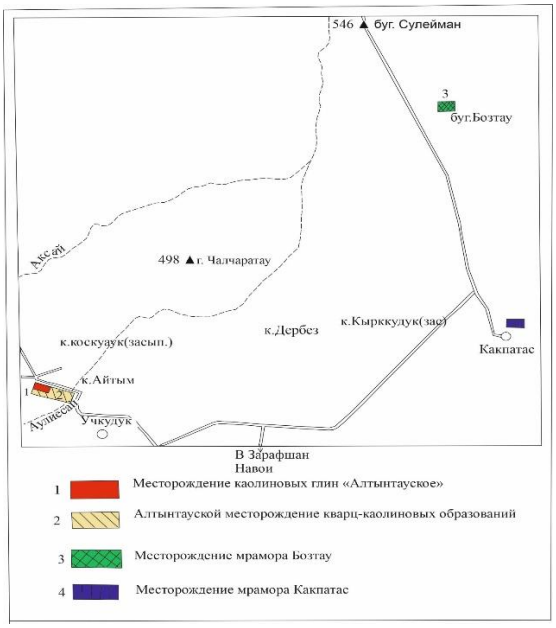

Fig. 1. Overview map of the work area, scale 1:2000000

The foundation of the deposit is represented by metamorphosed Proterozoic strata: siliceous shales, quartzites, and phyllites. These are exposed by drilling at depths of 5-10 m and are overlain by Cenomanian and kaolinite deposits. Mineralogically, these rocks are enriched with quartz and hydromicas, indicating a high degree of metasomatic alteration.

The main industrial object is the pre-bull weathering crust, formed on granites under long-term subtropical climate conditions. It is characterized by a distinct zonality: above it, a completely clay zone with a kaolinite content of over 60% is distinguished, white in color, and soft in structure. Below, the texture of the parent rock is preserved, but the degree of kaolinization differs; quartz, feldspar, and biotite are present.

The thickness of the kaolinized layers reaches 12-15 m, especially in the central and southern parts of the deposit. In the northwest, the crust is partially eroded, where granites and Proterozoic rocks emerge to the surface. The southern and eastern sections are complicated by re-deposited Cenomanian sandy-clayey rocks and conglomerates.

Geomorphologically, the territory is a slightly hilly plain with a south-eastern slope. Erosion forms have developed here - ancient channels and furrows that erode the kaolin thickness and form zones of secondary accumulation. Faults with an amplitude of up to 40 m play a dual role: they simultaneously contribute to the development of kaolinization and complicate the geological structure.

Thus, the geological structure of the "Altyntau" deposit is mosaic in nature, reflecting the interaction of the ancient foundation, granitoid magmatism, weathering crust, and covering sediments. This necessitates the heterogeneity of kaolin mineralization placement, variation in raw material quality, and the need for detailed geological-structural studies when assessing reserves [4-5].

Litological characteristic

Within the deposit, several lithological complexes are distinguished:

Metamorphic rocks of the Proterozoic – quartzites, siliceous schists, fillite-like argillites; they form tectonic contacts with granites and are characterized by high density, the presence of iron veins and sulfides (pyrite, marcasite).

Paleozoic granitoids – biotite-muscovite granites of light pink and grey-greenish color, products of the third phase of granitoid magmatism of late carbon - early perm; it is on them that the main zone of kaolinization is developed.

Prehistoric age of weathering crust – the main industrial facility with vertical zonality.

Cenomanian sandy-clayey deposits – erosion furrows are made, the kaolin thickness is covered.

Quaternary covers – are represented by modern deposits that partially remove and redistribute kaolin material.

Thus, the geological structure of the "Altyntau" deposit is mosaic in nature, reflecting the interaction of the ancient foundation, granitoid magmatism, weathering crust, and covering sediments. Such a complex structure has led to the formation of heterogeneous in composition and thickness kaolinized layers, which directly affects the quality and industrial value of raw materials. The presence of tectonic faults and erosional forms further complicates the deposit's morphology, creating both favorable kaolin accumulation zones and areas with their destruction. All this determines the need for detailed geological-structural, mineralogical, and geochemical studies to obtain a reliable assessment of reserves and their rational development [6-7-8-9].

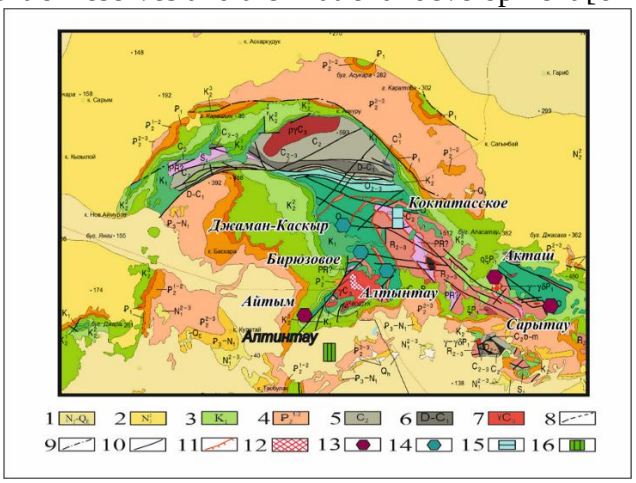

Fig. 2. Overview geological map of the Altyntau deposit

In thoracic kaolin clays	64,79	21,35	0,62	3,33	0,14	0,1	0,3	0,29	0,75	0,07	0

CONCLUSION

The "Altyntau" kaolin clays deposit is an important geological and industrial object, characterized by its complex structure, diverse lithological complexes, and high industrial potential. Conducted research shows:

Kaolinization is developed mainly on Late Paleozoic granites and is distinguished by a pronounced zonality;

The thickness of the useful layer reaches 12-15 m, the quality and composition of the raw material vary depending on the degree of preservation of the weathering crust and geological conditions;

chemical analysis confirms the industrial value of kaolins, which have a high content of SiO_2 and Al_2O_3 making them suitable for use in ceramic, refractory, and other industries;

the presence of erosion processes, tectonic disruptions, and re-deposited layers requires a comprehensive approach to further study and development.

Thus, the "Altyntau" deposit can become a promising raw material base for various industries of Uzbekistan, provided that it is rationally developed and detailed structural-geological studies are carried out.

MECHANOCHEMICAL ACTIVATION OF CENTRAL KYZYLKUM PHOSPHATE FLOUR

Jovliev B.E., Namazov Sh.S., Seytnazarov A.R.
Institute of General and Inorganic Chemistry

Summary: *Mechanical activation of phosphorites is considered an effective and environmentally friendly method of processing low-grade phosphorites. The effect of mechanical activation of phosphorite at a speed of 200 rpm and 30 minutes (20:1, 15:1, 10:1, 5:1 mass ratio) was studied using a Rigaku MiniFlex (Rigaku Corporation, Japan) X-ray diffractometer. The structural properties of the absorbable phosphorus and mechanically activated phosphorite flour were determined in Trilon B solution. The absorbable form of phosphorus in Trilon B solution after mechanical action in a mass ratio of 20:1 is 30.61%, and after a mass ratio of 5:1 is 33.66%. The increase in solubility is primarily due to a sharp decrease in the size of phosphorite particles, a decrease in the degree of crystallization of minerals and an increase in crystal lattice distortions through the $PO_4^{3-} \leftrightarrow CO_3^{2-}$ exchange, as well as the addition of OH^- groups to the structural lattice. The results of X-ray diffractometry show that the structural and phase changes caused by mechanical activation significantly increase the solubility of phosphorus in Trilon B solution. This indicates the economical and promising nature of this method for processing low-grade Central Kyzylkum phosphorites as fertilizers.*

Key words: *Central Kyzylkum phosphate, X - ray diffraction analysis, planetary ball mill, Trilon B solution, mechanochemical activation*

Introduction: Currently, the development of highly efficient and technologically advanced methods for the comprehensive processing of Central Kyzylkum phosphates, which are considered a primary raw material resource for the mineral fertilizer industry, is regarded as one of the strategically important directions in the advancement of the chemical industry. The government of our country is paying serious attention to ensuring the industrial sector with phosphate raw materials. According to the "Uzkhimyasanoat" Joint-Stock Company program for the deep processing of mineral resources for 2016-2030, developed under the directive of the President of the Republic of Uzbekistan, the production of phosphate rocks is planned to increase by 157% by 2020 and by 264% by 2030. At the same time, the annual volumes of off-balance ore and slag phosphate rock are expected to increase to 0.6-0.92 million tons and 1.1–1.8 million tons, respectively. The content of P_2O_5 in phosphate raw materials varies significantly between countries, ranging from 21% in Uzbekistan to 38.2% in Nauru. Globally, more than 85% of mined phosphate raw materials are used in the production of phosphate fertilizers, while the remaining 15% are utilized for the production of elemental phosphorus and feed additives for animals [1].

The use of activation methods in phosphate processing allows for a reduction in reagent consumption and an improvement in the quality of the final product. Activation methods include mechanical, chemical, thermal, and their combined forms, such as mechanochemical and thermochemical techniques. Worldwide, 70–80% of high-quality phosphate (P_2O_5 > 30%) is used for the production of phosphate fertilizers to adequately supply nutrients to agricultural crops. The decreasing availability of high quality phosphate, along with environmental problems arising from insufficient acid treatment, has intensified the need to search for more efficient methods of phosphate fertilizer production [2]. Nitrogen fertilizers should not be applied during autumn fertilization, as they are leached from the soil by water before sowing. In contrast, phosphate fertilizers are most effective when applied in autumn. Agricultural requirements dictate that 60-70% of the annual phosphate fertilizer for cotton and 100% for cereal crops should be applied during autumn fertilization. For these two crops alone, 272–292 thousand tons of P_2O_5 are required annually in the form of phosphate fertilizers. However, in 2019, our factories produced only 118.9 thousand tons of ordinary ammonium superphosphate. One of the main challenges at the Kyzylkum Phosphate Plant is the utilization of

enrichment residues classified as “off-balance ores.” Currently, more than 13 million tons of these residues have been accumulated. With the construction of the 2nd and 3rd Kyzylkum phosphate complexes, similar to the 1st complex, their volume is expected to increase significantly. A promising method for converting these residues into mineral and organomineral fertilizers is their chemical activation [3]. Phosphorus is one of the most important macronutrients involved in plant energy metabolism, photosynthesis, cell division, root system development, and yield formation. According to global scientific literature, phosphorus deficiency can reduce crop yields by 25–40% in cereals, legumes, and industrial crops. In the conditions of Uzbekistan, where a large part of soils is calcareous, phosphorus immobilization is intensified, which decreases its efficiency even when fertilizers are applied. The Central Kyzylkum phosphate represents the largest phosphate resource in the country and serves as an inexpensive raw material for industry. However, its main drawback is the very low solubility of apatite minerals in water and citrate. Therefore, the direct use of Central Kyzylkum phosphate as a fertilizer does not provide agronomic efficiency. Traditional activation methods, such as treatment with acids, thermal decomposition, and sulfation, are economically expensive, energy-intensive, or have limitations in terms of environmental safety [4].

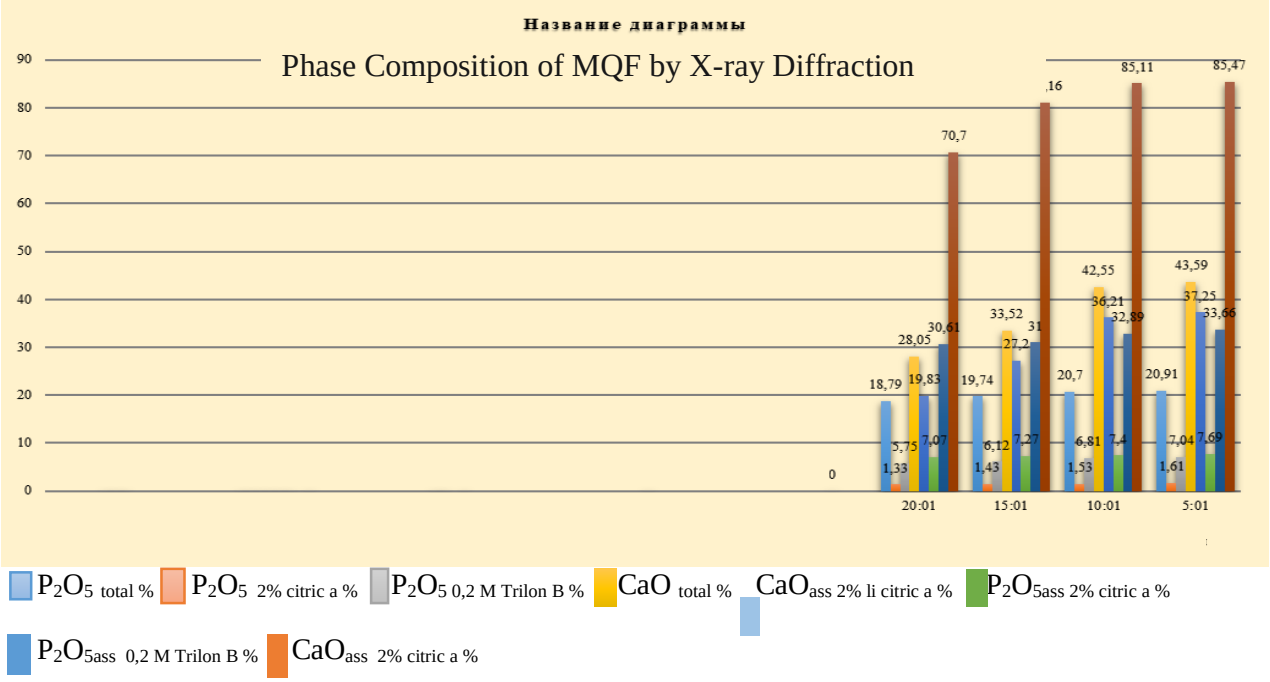
In recent years, the field of mechanochemistry has proposed new approaches for phosphate processing. Fundamental studies conducted by Ivanov (2018) and Smith (2017) have scientifically demonstrated that during mechanochemical treatment, the crystal lattice of minerals undergoes deformation, microcracks appear on particle surfaces, and chemical reaction rates are accelerated. It has been shown that during co-grinding with sulfate reagents, the conversion of calcium phosphate to ammonium–phosphate complexes is highly probable. Uzbek researchers—Rasulov (2020) and Bekchanov (2019)—have studied the mineral composition, physicochemical properties of Central Kyzylkum phosphate, and technologies for its activation adapted to local conditions. Their studies indicate that the granulometric composition of the phosphate, the high content of carbonates, and the crystal structure of apatite are the main factors limiting phosphorus bioavailability. The advantages of the Central Kyzylkum phosphate (CKP) technology can be explained as follows: a) low-cost reagents (ammonium sulfate is inexpensive and widely available); b) energy-efficient process (no acid consumption during mechanochemical activation); c) environmentally friendly (no waste gypsum is formed); d) the resulting product has high agronomic value. Although sufficient studies have been conducted on the mechanochemical activation of CKP, the acceleration process with ammonium sulfate and its impact on plant phosphorus uptake have not been fully explored [5].

Results and Discussion

The chemical composition of the phosphate used in this study is presented in Table 1. The effectiveness of phosphate fertilizers is determined by the content of P_2O_5 in forms that are insoluble in water but soluble in soil solutions and available for plant uptake.

Table 1

Raw material	P_2O_{5total}	CaO_{total}	CO_2	MgO	SO_3	Fe_2O_3	Al_2O_3	F^-	P_2O_5 0.2 M Trilon B	P_2O_5 2% citric acid	CaO 2% citric acid	CaO 2% citric acid	P2O5 2% citric acid (ass)	CaO 2% citric acid (ass)
Phosphoplast 2	19,26	49,19	13,49	1,27	1,96	1,52	2,54	3,99	3,75	2,52	34,34	31,44	13,08	69,81



The mechanochemical activation of phosphate was carried out in a two-chamber planetary ball mill with a working volume of 500 cm³ at a rotation speed of 400 rpm. Each chamber was loaded with samples weighing 10, 14, 20, and 40 g and seven steel balls with diameters of 3 mm and 7 mm, having a total mass of 200 g. The grinding time was 30 minutes at a rotation speed of 200 rpm, with mass ratios of 20:1, 15:1, 10:1, and 5:1. A 2 g sample of the raw material was weighed using an analytical balance. A 250 ml beaker was filled with the sample and moistened with 4 ml of distilled water, followed by the addition of 25 ml of HNO_3 and then 10 ml of distilled water. The mixture was heated at 300 °C. After the chemical reaction was complete, the solution was cooled to room

temperature and filtered. The P_2O_5 content in the solution was determined using a UV spectrophotometer (UV 1000), while the CaO content was measured by a complexometric method.

Determination of Phosphorus Solubility Using Trilon B

Alongside the total phosphorus content ($P_2O_{5(□_o□_a□)}$), its solubility in Trilon B is one of the most important factors in assessing the potential use of phosphate as a fertilizer. Compared to the initial solubility of phosphate (30.61%), the solubility of phosphorus in Trilon B increased from 30.61% to 33.66% when the grinding mass ratio varied from 20:1 to 5:1. The rapid increase in phosphorus solubility was observed at the initial 10:1 mass ratio of grinding, reaching its maximum value of 33.66% after grinding at a 10:1 mass ratio (32.89%).

Table 2

The experiments were conducted using a Rigaku MiniFlex X-ray diffractometer (Rigaku Corporation, Japan). This high-precision X-ray diffraction instrument is designed to determine the phase composition of powder samples. The device was operated under the following conditions: X-ray source Cu (Kα) radiation, λ = 1.5406 Å; measurement range -2θ,° = 3°-100°; detector DTex Ultra; software-PDXL or Match! for phase analysis and comparative identification. The samples were irradiated with X-rays, and diffraction patterns were obtained based on their crystalline structure. These spectral data were subsequently used for phase identification and compositional analysis. X-ray Phase Analysis of the Synthesized Phosphate Mineral Sample The X-ray phase analysis of the synthesized phosphate mineral sample (Figure 1) showed that the main crystalline phases were: Calcite: d/n = 0.385; 0.303; 0.279; 0.251; 0.228; 0.209; 0.193; 0.191; 0.187; 0.160; 0.152; 0.144; 0.142; 0.133; 0.123; 0.115… Apatite ($Ca_5(PO_4)_3F$): d/n = 0.808; 0.279; 0.269; 0.262; 0.251; 0.228; 0.224; 0.193; 0.183; 0.176; 0.174; 0.172; 0.163; 0.160; 0.152; 0.145; 0.144; 0.142; 0.133; 0.123; 0.115…The peaks corresponding to these d-spacings (nm) indicate the onset of spinel phase formation, suggesting the initiation of crystallization of the spinel structure.

PXRD Results of Apatite ($Ca_5(PO_4)_3F$) Mineral

In our study, the solubility of phosphorus increased by more than 7.07% at a 20:1 mass ratio of grinding, exceeding Brazilian standards. Considering the amount of plant-available phosphorus obtained by grinding phosphate at a 10:1 mass ratio (P_2O_5 < 7.2%), results comparable to those of calcium superphosphate can be achieved [6]. The energy consumption and phosphate processing analysis indicated that grinding for 30 minutes at a 10:1 mass ratio was optimal for this experiment. The next stage of such studies should include the investigation of the bioefficiency of mechanochemically activated phosphate under field conditions.

Conclusion

The conducted chemical analyses confirmed that the efficiency of mechanochemical activation of Central Kyzylkum phosphate in a planetary ball mill is significantly dependent on the grinding duration, in accordance with other processing parameters. The results demonstrated that 30 minutes of mechanochemical activation at a 10:1 mass ratio substantially increased the phosphorus availability in Trilon B solution. To balance activation efficiency with energy consumption, the 10:1 mass ratio was scientifically determined as optimal for fractionation. Changes in the phosphate's surface morphology, functional groups, crystal lattice, and phase composition were found to be associated with fine grinding. Such structural modifications, characteristic of this mechanochemical activation process, provide important scientific and practical conditions for the development of waste-free and environmentally friendly technologies for phosphate fertilizer production based on local raw materials in the country.

Резюме:.*Механохимическая активация фосфатов рассматривается как эффективный и экологически чистый метод переработки низкосортных фосфатов. С помощью рентгеновского дифрактометра Rigaku MiniFlex (Rigaku Corporation, Япония) была изучена механическая активация фосфата при 200 об/мин в течение 30 минут с различными массовыми соотношениями (20:1, 15:1, 10:1, 5:1). Были определены усвояемая форма фосфора в растворе Трилона B и структурные характеристики механохимически активированного фосфатного порошка. Усвояемая форма фосфора в растворе Трилона B составила 30,61 % после механического воздействия при массовом соотношении 20:1 и 33,66 % при соотношении 5:1. Увеличение растворимости в первую очередь связано с резким уменьшением размера частиц фосфата, снижением степени кристаллизации минералов, обменом* $PO_4^{3-} \leftrightarrow CO_3^{2-}$*, а также включением гидроксильных групп (*OH^-*) в кристаллическую решётку, что усиливает нарушения кристаллической структуры. Результаты рентгеновской дифракции показали, что структурные и фазовые изменения, вызванные механической активацией, значительно повышают растворимость фосфора в растворе Трилона B. Это демонстрирует экономичность и перспективность данного метода переработки низкосортного центральнокызылкумского фосфата в удобрение.*

BEETLES (INSECTA: COLEOPTERA) OF THE NORTHWESTERN KYZYLKUM DESERT: TAXONOMIC COMPOSITION, ECOLOGICAL FEATURES, AND PEST STATUS ON DOMINANT DESERT PLANTS

Kalimbetova R.N.
Karakalpak State University named after Berdakh
Email: rozaqalimbetova135@gmail.com

Summary: *The northwestern part of the Kyzylkum Desert (southern Priaralye region, Karakalpakstan, Uzbekistan) is subject to intense desertification processes associated with the Aral Sea crisis. This study, based on long-term field research (2023–2025), presents the first comprehensive review of the beetle fauna (Insecta: Coleoptera) of the northwestern Kyzylkum, with particular attention to phytophagous species on key desert plants (Haloxylon, Tamarix, Artemisia, Calligonum, Salsola spp., Ammodendron, Halothamnus, Atraphaxis, etc.). A total of 378 beetle species belonging to 56 families were recorded, of which 312 species are phytophagous or have trophic links with desert vegetation. The families Buprestidae (87 species), Chrysomelidae (68 species), Curculionidae (51 species), Tenebrionidae (44 species), and Bostrichidae (21 species) dominate. 195 species were recorded on Haloxylon aphyllum (black saxaul) alone, confirming its role as the main host plant in psammophytic communities of the region. 68 new records for Karakalpakstan and 41 species new for the northwestern Kyzylkum are reported. A taxonomic catalogue, ecological groupings (xylophages, rhizophages, phyllophages, etc.), and pest status of the dominant species are provided. The results highlight the high conservation value of beetle diversity in anthropogenic deserts and provide a basis for monitoring programmes in restored "green cover" areas on the dried Aral Sea bed.*

INTRODUCTION

The Kyzylkum Desert, one of the largest sandy deserts in Central Asia, occupies vast territories in Uzbekistan, Kazakhstan, and Turkmenistan. Its northwestern part (territories of Karakalpakstan and Khorezm adjacent to the southern coast of the Aral Sea) has experienced dramatic environmental changes due to the Aral Sea desiccation, leading to the formation of the Aralkum Desert and intensification of desertification processes [1,2]. These changes have significantly affected insect communities, particularly beetles (Coleoptera), which constitute a dominant group in arid ecosystems due to their ecological plasticity and trophic specialisation [3–5].

Despite numerous studies on the Coleoptera of Central Asian deserts [6–9], the northwestern Kyzylkum remains insufficiently studied. Most available data concern Tenebrionidae and Staphylinidae of the central and eastern Kyzylkum [10,11], while phytophagous complexes on dominant desert plants (saxaul, tamarisk, wormwood, etc.) in the Priaralye part of the desert have not been systematically summarised. The present work fills this gap on the basis of original material collected by the author during 2023–2025 in the Beruniy, Ellikkala, Turtkul, and Takhtakupir districts of Karakalpakstan.

EXPERIMENTAL RESEARCH

The research materials were collected from the desert and tugai areas of Karakalpakstan in 2023–2025. Standard entomological methods were employed, including visual observations, sweeping nets, pitfall traps, and soil excavations for collecting weevils (e.g., *Megamecus viridans*, *Lixus incanescens*, *Ammocleonus quadrimaculatus*).

3. In our studies, we used the Barber method of soil traps [1] to catch beetles. Glass containers with a diameter of 72–73 mm and a capacity of 0.5 liters and 0.25 liters (55 mm diameter) were used as traps, which were dug level with the soil surface. In each biotope, 10 traps were typically placed in a row, 10 meters apart. In some experiments, between 20 and 70 traps were used. Ethyl acetate solution was employed as the fixation liquid. The traps were often used for faunal collection.

4. In our research, we mainly used the light trap method described by N.L. Sakharova [2]

Specimens were photographed using a Canon PowerShot A640 camera and MicroMed MC-2-ZOOM microscope, with images edited in Adobe Photoshop 7.0. Species identification relied on

international catalogs such as “Catalogue of Palaearctic Coleoptera” [6] and scientific references therein.

RESEARCH RESULTS

Analysis of the material collected during 2023–2025 in the northwestern Kyzylkum Desert (Beruniy, Ellikkala, Turtkul, and Takhtakupir districts of Karakalpakstan) revealed 378 species of beetles belonging to 56 families. Of these, 312 species (82.5%) are directly or indirectly associated with desert vegetation (phytophagous, carpophagous, xylophagous, rhizophagous, and pollinophagous forms).

The most species-rich families are:

- *Buprestidae* – 87 species (23.0% of the total fauna)
- *Chrysomelidae* – 68 species (18.0%)
- *Curculionidae* – 51 species (13.5%)
- *Tenebrionidae* – 44 species (11.6%)
- *Bostrichidae* – 21 species (5.6%)
- *Cerambycidae* – 19 species
- *Meloidae* – 17 species
- *Scarabaeidae* – 15 species
- *Carabidae* – 14 species
- *Dermestidae* – 12 species

The remaining 46 families are represented by 1–9 species each.

Haloxylon aphyllum (black saxaul) is confirmed as the main “oasis-forming” plant and the principal host for phytophagous beetles: 195 beetle species (51.6% of the total recorded fauna) were found on this plant alone. The dominant complexes on saxaul are formed by jewel beetles (Buprestidae: Sphenoptera spp., Julodis variolaris), longhorn beetles (Cerambycidae: Turkaranyia nomas, Phytoecia spp.), false blister beetles (Meloidae: Meloe spp.), and bark beetles (Bostrichidae: Sinoxylon sexdentatum).

Other important host plants and the number of associated beetle species:

- *Tamarix spp*. – 112 species
- *Artemisia terrae-albae*, A. diffusa – 98 species
- *Calligonum* spp. – 87 species
- *Salsola* spp. (incl. S. rigida, S. paulsenii) – 74 species
- *Ammodendron conollyi*, A. karelinii – 53 species
- *Halothamnus subaphyllus* – 41 species
- *Atraphaxis spinosa*, A. replicata – 38 species

New records:

- 68 species are recorded for the first time for the fauna of Karakalpakstan
- 41 species are new to the northwestern Kyzylkum
- 12 species (mainly Buprestidae and Cerambycidae) are rare Central Asian endemics previously known only from the central and southern parts of the desert

Ecological grouping of phytophagous beetles:

- *Xylophages* (wood-borers) – 118 species (31.2%)
- *Phyllophage*s (leaf feeders) – 89 species
- *Carpophages* and pollinophages – 57 species
- *Rhizophages* (root feeders) – 36 species
- *Anthophages* (flower visitors with occasional damage) – 12 species

Among the recorded species, 27 are of economic importance as pests of desert pasture and forest plantations:

- Serious pests of black saxaul (*Haloxylon aphyllum*): Sphenoptera tapula, Julodis variolaris, Turkaranyia nomas, Sinoxylon sexdentatum, Phytoecia asiatica
- Pests of white saxaul (*Haloxylon persicum*) and tamarisk: Capnodis mnsourmiana, Pseudocneorhinus bifasciatus

- Pests of Calligonum and Salsola: Eremochorus kusnezovi, Trichosirocalus korotyaevi
- Polyphagous pests in reclamation zones: Agapanthia dahli, Bothyna undata, Psilothrix viridicoerulea

CONCLUSIONS

The beetle fauna of the northwestern Kyzylkum Desert numbers at least 378 species from 56 families, representing one of the richest coleopteran complexes among the anthropogenically transformed deserts of Central Asia. The dominant position of the families Buprestidae, Chrysomelidae, Curculionidae, Tenebrionidae, and Bostrichidae reflects the extreme aridity and predominance of psammophytic and halophytic vegetation. *Haloxylon aphyllum* serves as the main refugium and trophic base, supporting more than half of the recorded beetle species (195 species). Its conservation and restoration are critical for maintaining regional beetle diversity. The discovery of 68 species new to Karakalpakstan and 41 species new to the northwestern Kyzylkum underlines the previous understudied status of the region and the high degree of endemism in the Priaralye part of the desert. A group of dangerous pests of desert forestry plantations has been identified (27 species), the most harmful being xylophagous Buprestidae, Cerambycidae, and Bostrichidae on saxaul. This necessitates the inclusion of these species in monitoring programmes on the dried Aral Sea bed and in "green belt" restoration projects.

The obtained data provide the first comprehensive baseline for long-term monitoring of beetle communities in the Aralkum and restored areas of the southern Priaralye, and emphasise the high conservation value of coleopteran diversity in anthropogenic desert ecosystems.

Summary. *The article presents the results and scientific literature data on the practical significance of some species of the Southern Aral Sea true fly family, Musca domestica Linnaeus, 1758. Furthermore, scientific data are presented on the synonyms of the species *Musca domestica Linnaeus*, 1758, their distribution characteristics, and how global climate change leads to an increase in the number of harmful species.*

Key words*. Palearctic, True flies, Diptera, Muscidae, family, Musca domestica Linnaeus, 1758, Synonyms, bioecological characteristics.*

Introduction. True flies are considered one of the largest families within the order Diptera. Today, science knows about 4000 species of representatives of this family in the world fauna. 52 genera and about 850 species are distributed in the Palearctic. In the CIS countries, more than 400 species of the Muscidae family have been recorded. They are found in almost all natural areas and in most landscapes. The morphological and ecological diversity of the family is enormous, therefore it is difficult to characterize each species of all representatives [1. 715; 2. 142; 6. 605; 7. 2094; 10. 970].

The flies include predators, blood-sucking insects, necrophages, and those that consume decomposable organic matter. The life forms of the larvae are also very diverse. They develop on rotten wood, under tree bark, in the carcasses of vertebrates, in the feces of large ungulates, in bird nests, and in small mammals; some species live in freshwater bodies. In spring, the larvae of some species of flies can be found on various trees. Most species of the family develop on decomposed organic remains of plants and animals, where their larvae themselves process the remains [2. 144; 3. 5].

A number of species of real flies are plant pest species. Only specialized parasites are present in the family, although parasitism is also known in the most primitive, imperfect forms of these flies. Many species of true flies are synanthropic, that is, closely related to humans. Therefore, it rapidly increases in residential areas, causing sanitary-epidemic situations.

Research materials and methods. Among all known entomological methods of collecting biomaterials, the Malez trap, entomological traps, and colored plates, suitable for species of the order Diptera, were widely used. Colorful plates are a widely used method for collecting pollinating insects from plants. The color of the trap is of particular importance, since different groups of insects are attracted to a certain color [8. 277]. Much work has been done to determine the involvement of various groups of pollinators and pests of particular flowers [8. 277; 10. 271]. Different researchers have different opinions, and the number of true fly species is considered more effective when catching with a Malez trap and entomological trapping than when catching with a colored plate.

Research results. *Musca domestica* Linnaeus, 1758, known as the housefly in the work of representatives of the true fly family, is considered a cosmopolitan species and has always attracted researchers' attention. It has been proven that this species has synonyms such as *Musca aurifacies* Robineau-Desvoidy, 1830, *Musca contigua* Walker, 1853, *Musca flavifacies* Bigot, 1888, *Musca harpyia* Harris, 1869, *Musca taitensis* Macquart, 1843, *Musca vicina* Macquart, 1851 [3. 4; 5. 426; 9. 18].

The morphological structure of this species is quite complex. The body length is 7-9 mm. The head is hemispherical, rounded at the back. Her eyes and cheeks are covered with a gray coating

behind them. The moustaches are dark brown, the top of the second segment and the base of the third segment are reddish. The rib cage is covered with a black, gray coating. The abdomen is ovate, with black-brown or yellow sections. The legs are black and brown. Wings are transparent, sometimes slightly darkened [5. 426].

From the desert regions of Central Asia, the housefly has the status of a species distributed today in almost all regions of our planet under the influence of environmental factors. *Musca domestica* Linnaeus, 1758, completely transitioned from natural biocenoses to urbanized areas. Manure, feces, and various debris have become foci where housefly larvae, a constant companion of these settlements, develop. The rate of reproduction of this species is very impressive. The average female lays about 100-150 eggs at a time, but with adequate nutrition, oviposition is repeated with an interval of 2-4 days, so its total fertility is 600 eggs, and in countries with a hot climate, 2000 eggs or more are known. If the larvae, pupae, and flies themselves had not died, only one female could have exceeded 5 trillion (5,000,000,000,000) specimens by the end of summer. One liter of horse or cow manure or the same amount of kitchen waste from a housefly can develop from 1000 to 1500 fly larvae simultaneously, and up to 4000 in pig manure. Houseflies are a dangerous distributor of infections. Each of them is found in feces and various stools, carrying about 6 million microorganisms on the surface of their bodies and at least 25-28 million in the intestines [3. 4; 5. 426; 9. 18].

However, I should say that the pathogenic bacteria in the fly's intestines are not digested and are fully viable outside. In the flies, TIF and paratyphoid bacilli, dysentery bacillus, cholera, tuberculosis bacillus, anthrax spores, diphtheria pathogen, and larval eggs were found. Therefore, the fight against houseflies is an important link in the overall system of human disease control. Along with housefly larvae, many other species of this family develop in manure and dung [9. 18; 11. 62]. The larvae of houseflies begin their lives as consumers of decomposing plant matter, but then become stronger and begin to feed on the larvae of other diphtheria, that is, they become predators. Competition between species in the manure biocenosis is, as a rule, very fierce.

Species close to *Musca domestica* Linnaeus, 1758, are also common and cause similar and epidemiological problems in species classification. Of the main ones, with the arrival of autumn season, the first to appear is the autumn broomrape (*Stomohus calcitrans*), which is a blood-sucking fly and is harmful as a mechanical carrier of the pathogens of anthrax, tularemia, and other diseases [6. 607]. The species *Stomoxys calcitrans* (Linnaeus, 1758), which reproduces by the end of summer and is clearly distinguished from house flies, has a gray body length of 6 mm with black spots in the abdominal cavity. They sting painfully and sometimes infect people with infectious diseases such as anthrax through their injections. Larvae live in manure. The blood-sucking fly carries a special type of trypanosoma, the causative agent of "sleep disease," widespread in Africa. Trypanosomes themselves are always located in the blood of antelopes and do not harm them. The Glossina fly, by drinking the blood of such an antelope, often bites a person and infects him with trypanosomes. The disease manifests as deep fatigue and usually ends in death [5. 427; 6. 607].

A representative of another family of the same species, *Glossina morsitans* from the family Glossinidae, transmits a similar disease, but it affects only animals. Interestingly, in these mosquitoes, the larva fully develops in the female's swollen abdominal cavity and feeds on special secretions from accessory glands. After hatching from the mother's body, the larva immediately buries itself in the soil. Morphologically similar to true flies of the Anthomyiidae family - true flies that develop in living plant tissues are very serious pests. Among them, the species *Delia radicum* (Linnaeus, 1758) sharply differs from the true fly family. The body is an imago, with stamens 5-5, 5 mm, dark gray with wide dark stripes on the back. A broad black longitudinal line runs across the entire animal, with a narrow transverse line in all segments. Their eyes are closing. Lob v 4-5. Females are larger (6-6.5 mm), light gray in color. The width of the forehead is almost equal to the width of the eye. It lays an average of 100-150 eggs. Several females can lay eggs on a single plant. The eggs are white, curled. Larvae appear after 5-10 days. The larva is legless, thick, white or yellow, and shiny. The larva feeds for 20-30 days. The development of the pupa in spring offspring lasts 15-20 days, in autumn - several months. Overwinters in the soil at a depth of 10-15 cm [6. 608].

In conclusion, it should be noted that from some species of true flies of the Southern Aral Sea region, six synonyms of the species *Musca domestica* Linnaeus, 1758 appeared, which spread from the desert regions of Central Asia to almost all regions of the planet today, that is, it has become a cosmopolitan species. The breeding productivity of this species is 600 eggs, and as a result of global warming, it is possible to lay 2000 or more eggs. Monitoring the number of houseflies requires, first of all, constant study of their biology and ecological nutritional properties.

NUMERICAL MODELING OF THE DENSITY OF STATES OF A TWO-DIMENSIONAL ELECTRON GAS IN A QUANTIZING MAGNETIC FIELD

Baymatov P.J.[1], Abdulazizov B.T.[1], Yunusov O.M.[2], Tohirjonov M.S.[1]
[1]*Namangan State University*
[2]*S.A. Azimov Physical-Technical Institute of the Academy of Sciences of the Republic of Uzbekista.*

Summary: *The results of numerical modelings of the density of states of a two-dimensional electron gas in a strong transverse magnetic field are presented. Various theoretical models are discussed that can be used to obtain information about the density of states of electron energy levels in a quantum well. The fraction of electrons in localized and delocalized states is determined numerically.*

Key words: *Heterostructure, two-dimensional electron gas, quantum well, Landau subbands, magneto oscillation, filling factor, density of states, chemical potential, localized states.*

Introduction

If a magnetic field is applied perpendicular to the layer, the electron spectrum in a semiconductor heterostructure quantum well (QW) or in the inversion layer becomes fully quantized [1–5].

In the ideal case, discrete Landau levels $E_N = (N + 1/2)\hbar\omega$ (without considering spin) are separated by a gap – the cyclotron energy $\hbar\omega \sim B$. In reality, the gas is not completely ideal; due to electron scattering (by phonons, impurities, other electrons, etc.), the Landau levels acquire a finite width Γ. In strong magnetic fields, typically $\Gamma < \hbar\omega$. The shape of the broadened levels $g(E,\Gamma)$ is usually described by either a Lorentzian or a Gaussian. The density of states (DOS) is maximal at the center of the peak and rapidly decreases away from it.

Useful information about the density of states (DOS) can be obtained from measurements of magnetization [6,7], heat capacity [8], and chemical potential [9–11]. In these studies, the experimentally measured quantities were compared with theoretical calculations based on various DOS models. A simple model with a Gaussian distribution of the DOS, involving a single fitting parameter Γ, also explains the main features of the measured oscillations. However, when fitting Γ, deviations from the experiment always appeared in the regions of strong or weak magnetic fields. To explain the shape of the oscillations, in some works the broadening parameter Γ had to be considered dependent on the magnetic field B, while in other works even on the concentration n_S or on temperature. A discussion of such mechanisms can be found in the review [12].

In the present work, numerical modeling is used to study the oscillations of the chemical potential and the density of states (DOS) at the Fermi level based on: (i) a simple model with a Gaussian distribution of the DOS involving a single fitting parameter Γ, and (ii) a model of localized and delocalized states with two fitting parameters ξ, Γ. Oscillations of the concentrations in the localized and delocalized parts of the DOS have been found.

Models

Let us begin with a simple model, where the shape of the single-particle DOS is expressed as a sum of Gaussian functions [1,8,11,12,16–17].

$$g(E) = D\hbar\omega \sum_{N=0}^{\infty} \frac{e^{-\frac{(E-E_N)^2}{2\Gamma^2}}}{\sqrt{2\pi}\Gamma} \qquad (1)$$

Here, $\hbar\omega$ denotes the cyclotron energy.

$$\hbar\omega = \hbar\frac{eB}{m^*} = \frac{0.116}{m^*/m_0}B\left[\frac{\text{meV}}{\text{Tesla}}\right] \tag{2}$$

m^* is the effective mass of the electron. D is the two-dimensional density of states of the miniband in the absence of a magnetic field $B = 0$, which is related to $\hbar\omega$ by a certain relation

$$D\hbar\omega = \frac{eB}{\pi\hbar},\ D = \frac{m^*}{\pi\hbar^2} = \frac{m^*}{m_0}\frac{413\cdot10^9}{\text{meV}\cdot\text{cm}^2} \tag{3}$$

The filling factor is a quantity

$$\nu = n_S / D\hbar\omega \tag{4}$$

The integer part of this quantity determines the number of completely filled Landau levels. The degeneracy of any Landau level is $D\hbar\omega$. As the magnetic field increases, all electrons eventually occupy the lowest level $N = 0$. Then, from formula (4), taking into account (2) and (3), one can obtain the so-called "fundamental field" ($\nu = 1$).

$$B_f = \frac{\pi\hbar n_S}{e} \tag{5}$$

The chemical potential of the gas μ is determined from the condition of conservation of the two-dimensional electron concentration in the quantum well (QW)

$$n_S = \int_{-\infty}^{\infty} g(E)\frac{dE}{e^{\frac{E-\mu}{k_BT}}+1} = D\hbar\omega\sum_{N=0}^{\infty}\int_{-\infty}^{\infty}\frac{e^{-\frac{(E-E_N)^2}{2\Gamma^2}}}{\sqrt{2\pi}\Gamma}\frac{dE}{e^{\frac{E-\mu}{k_BT}}+1} \tag{6}$$

Here, k_B is the Boltzmann constant. The internal energy is equal to

$$U_\mu = \int_{-\infty}^{\infty} g(E)\frac{EdE}{e^{\frac{E-\mu}{k_BT}}+1} = D\hbar\omega\sum_{N=0}^{\infty}\int_{-\infty}^{\infty}\frac{e^{-\frac{(E-E_N)^2}{2\Gamma^2}}}{\sqrt{2\pi}\Gamma}\frac{EdE}{e^{\frac{E-\mu}{k_BT}}+1} \tag{7}$$

By setting T and n_S, one can obtain the oscillation of $\mu(B)$ from equations (6). Substituting $\mu(B)$ into (6a), we find the oscillation of $U_\mu(B)$.

In the model presented above, it is assumed that the system is isolated, and therefore the electron concentration in the quantum well (QW) is fixed in equation (6). As a result, when a magnetic field is applied, oscillations of the chemical potential occur (the $n_S = const$ model).

In the real case, the quantum well (QW) has direct or indirect contact (through a spacer) with the doped layers. Under thermodynamic equilibrium, the electron gas in the QW and the donors in the doped layers (the reservoir) share a common Fermi energy. In this situation, it is assumed that when a magnetic field is applied, the Fermi energy remains unchanged, while the concentration $n_S(B)$ oscillates (the $E_F = const$ model). Below, we will not use all of these models; their detailed discussion can be found in [12,14].

Here, $\theta(E)$ is the Heaviside function, and ξ denotes the fraction of electrons in localized states, which serves as a fitting parameter. Replacing $g(E)$ with $g_L(E)$, instead of equations (6) we obtain

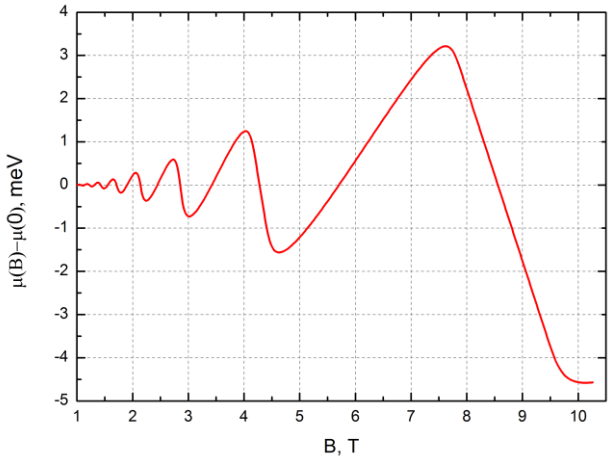
$$n_S = \xi D k_B T \ln\left(1+e^{\frac{\mu}{k_BT}}\right) + (1-\xi)D\hbar\omega\sum_{N=0}^{\infty}\int_{-\infty}^{\infty}\frac{e^{-\frac{(E-E_N)^2}{2\Gamma^2}}}{\sqrt{2\pi}\Gamma}\frac{dE}{e^{\frac{E-\mu}{k_BT}}+1} = n_L(B)+n_D(B) \tag{9}$$

The temperature-dependent internal energy is equal to

$$U_\mu = \xi D \cdot \left(\frac{\mu^2}{2} + (k_B T)^2 \,\mathrm{dilog}\left(1 + e^{-\frac{\mu}{k_B T}}\right) + \frac{\pi^2 (k_B T)^2}{6} \right) + (1-\xi) D\hbar\omega \sum_{N=0}^{\infty} \int_{-\infty}^{\infty} \frac{e^{-\frac{(E-E_N)^2}{2\Gamma^2}}}{\sqrt{2\pi}\Gamma} \frac{EdE}{e^{\frac{E-\mu}{k_B T}} + 1} \tag{10}$$

Here it is also assumed that the system is isolated and $n_S = const$. When a magnetic field is applied, oscillations occur in the chemical potential and in the electron concentration, both in the localized states $n_L(B)$ and in the delocalized states $n_D(B)$. In the presence of $n_L(B)$, the shape of the oscillations $\mu(B)$ now differs from the one obtained from (6). By adjusting the parameters ξ, Γ to the experiment, the authors of [8] were able to explain the oscillations of the heat capacity.

Numerical results and discussion



As an example, we will model the quantities $\mu(B,T)$, $U_\mu(B,T)$ and $g_L(\mu)$ (see below). Other thermodynamic quantities (for example, entropy, heat capacity, magnetization) can be obtained using well-known formulas of statistical physics by calculating the free energy or the thermodynamic potential [13]. Since all thermodynamic quantities are directly determined through the DOS, it is also useful to model the thermodynamic density of states (TDOS). Its oscillation directly reproduces the oscillation of the studied thermodynamic quantity. The thermally broadened DOS is the TDOS, which is defined as [15]

$$g_L(\mu(B),T) = \frac{\partial n_S}{\partial \mu} = \int_{-\infty}^{\infty} g_L(E) \frac{\partial f(E,\mu(B))}{\partial \mu} dE \tag{11}$$

$g_L(E)$ is the DOS at zero temperature (8). Only under $T = 0$, equation (11) determines the DOS at the Fermi level. To calculate $g_L(\mu(B),T)$, one first determines $\mu(B)$ from (9) and then substitutes it into (11).

As can be seen from the structure of equations (9) and (10), for $\xi = 0$ (no localization) one obtains a simple model with a single Gaussian. Therefore, in what follows we will use the equations of the localized and delocalized states model (ii). To model the DOS, we will also need formulas (1), (8), and (11).

For numerical calculations and in order to compare the obtained results, we will use the material parameters from [11]: $m^* = 0.068\, m_0$, $n_S = 4.1 \times 10^{11}\, cm^{-2}$.

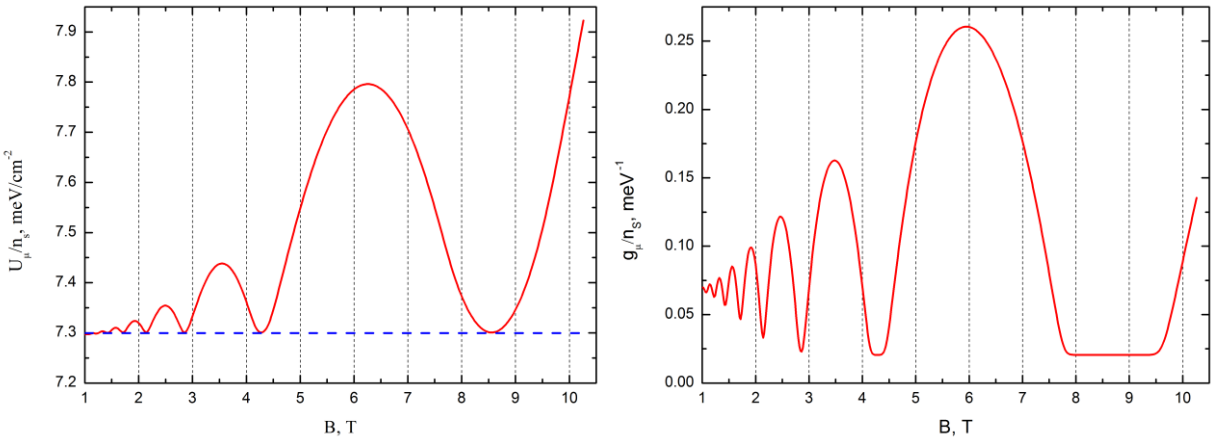


Figure 1. Relation of the thermodynamic quantities of a two-dimensional electron gas to the magnetic field. $\zeta = 0.3$, Γ=0.72 meV, T=2.17 K.

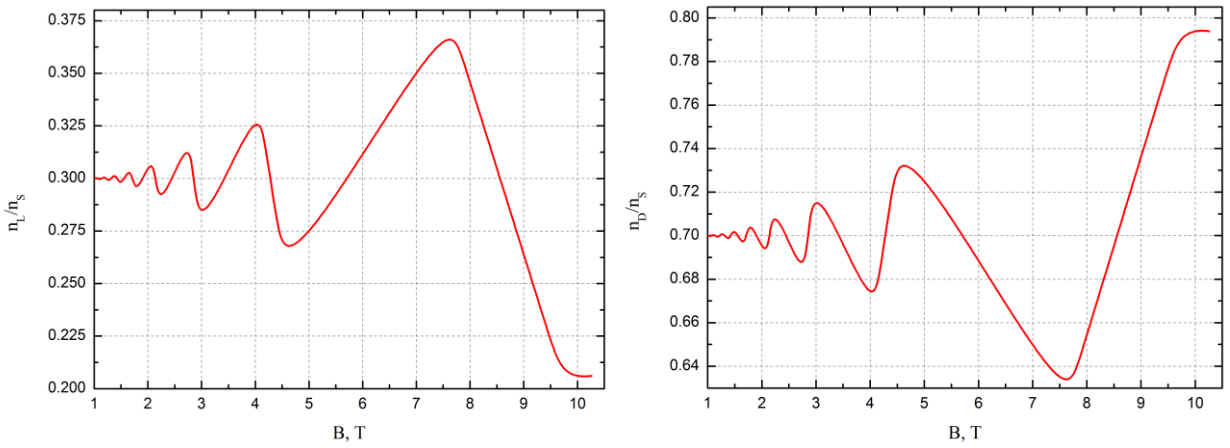
The quantity μ can be numerically calculated as a function of the magnetic field and temperature $\mu(B,T)$. At $T = 0$, under the action of a magnetic field μ, sawtooth-like oscillations appear in the vicinity of the Fermi level. At nonzero temperatures, the teeth become smoothed. This is due to the fact that, under the influence of thermal energy, part of the electrons is redistributed to nearby levels.

With an increase in the magnetic field strength, μ increases. Electrons transition to higher energy levels. The internal energy U_μ also increases. When half-integer values of the filling factor are reached, μ falls in the middle of the last Landau level. In this case, the density of states reaches its maximum value, and the internal energy also attains a maximum.

In stronger magnetic fields, the capacity of each Landau level increases. As a result, in accordance with the principle of minimum energy, electrons begin to occupy lower-energy levels. The chemical potential decreases. Since the number of high-energy electrons is reduced, U_μ also decreases. When the filling factor reaches integer values, the last Landau level becomes completely filled. The internal energy takes on its minimum value, and the density of states becomes zero.

If the presence of a localized density of states between Landau levels is taken into account, changes in the oscillations are observed. When the chemical potential lies between the levels, the density of states does not become zero (Fig. 1). In numerical calculations, in the case of $\xi = 0$, a sharp decrease in the oscillations of the chemical potential was observed. If one considers the density of states localized between Landau levels ($\xi \neq 0$), it can be seen that the maxima in the oscillations are shifted to the left, while the minima are shifted to the right. Thus, this model provides closer agreement of the results with the experiment. In this case, the total concentration is divided into localized and delocalized parts.



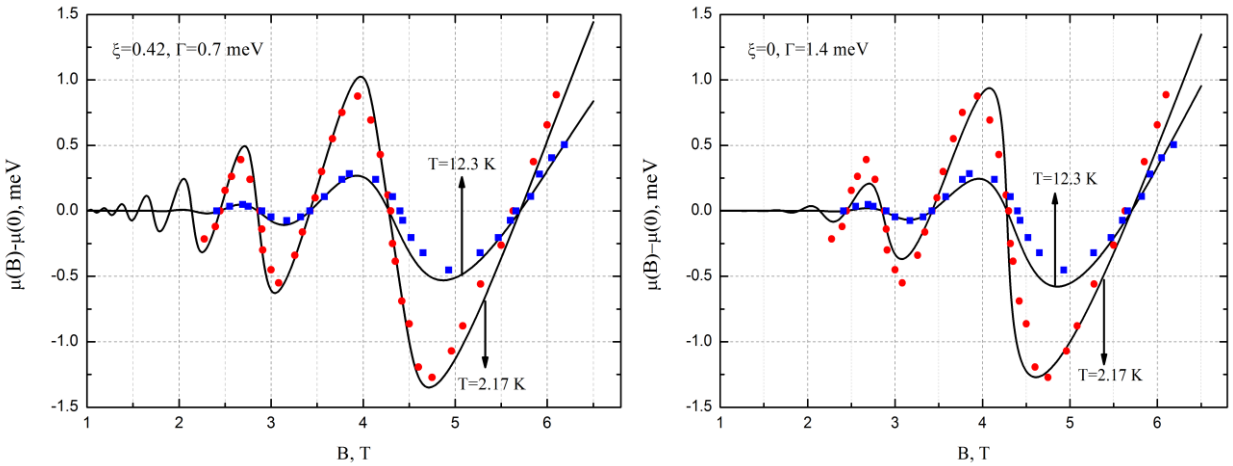


Figure 2. Dependence of the concentration of localized (n_L / n_S) and delocalized (n_D / n_S) electrons on the magnetic field strength. $\zeta = 0.3$, Γ=0.72 meV, T=2.17 K.

Figure 2 shows how the concentrations of localized (n_L / n_S) and delocalized (n_D / n_S) electrons in a two-dimensional electron gas system change with increasing magnetic field. From the graphs, it can be seen that under the influence of the magnetic field, periodic oscillations are observed in both concentrations.

As the magnetic field increases, the density of Landau levels changes, and their filling depends on whether the filling factors are integer or half-integer. Delocalized electrons participate in states with higher energy, and their fraction sharply increases with increasing magnetic field. In contrast, localized electrons are concentrated near the Landau levels, and their concentration decreases as the magnetic field grows. At integer filling factors, the Landau levels are completely filled, and the contribution of delocalized electrons increases. At half-integer filling factors, the upper Landau level is only partially filled, and in this case strong localization is observed.

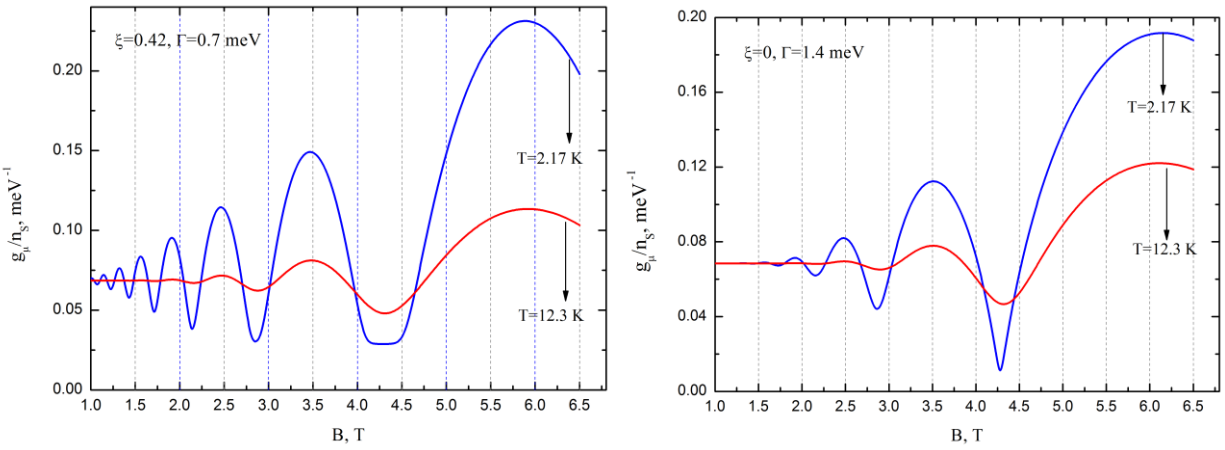

Figure 3. Comparison of the chemical potential and the density of states of a two-dimensional electron gas at different temperatures.

In Fig. 3, the oscillations of the chemical potential and the density of states are shown. In the calculations, first the contribution of the density of localized states ($\xi = 0.42$, $\Gamma = 0.7$ meV) was taken into account. Then the case without localization ($\xi = 0$, Γ = 1.4 meV) was considered. At low temperatures(T=2.17 K), strong oscillations appear in the density of states, while at higher temperatures (T=12.3 K) the oscillations are smoothed due to thermal transitions. When the density of localized states is included, a shift of the maximum and minimum points in the oscillations of the chemical potential is observed. As a result, at the chosen values of ξ, Γ the calculated values of the chemical potential are in good agreement with the experimental data.

Conclusions

This work presents the results of numerical modeling of the chemical potential, internal energy, and density of states of a two-dimensional electron gas in a transverse magnetic field. Theoretical models providing access to these quantities are discussed. It has been shown that, when the localized density of states between successive Landau levels is taken into account, the maxima of the chemical potential oscillations are shifted to the left, while the minima are shifted to the right. Oscillations of the localized and delocalized electron concentrations have been analyzed. The approximation of experimental and numerical results for the chemical potential at two different temperatures, achieved by fitting the fraction of localized electrons (ξ) and the broadening parameter (Γ), is presented in the graphs.

FAUNA OF VESPID WASPS (HYMENOPTERA: VESPIDAE) OF THE UZBEKISTAN PART OF THE KYZYLKUM DESERT

Minajatdinova Z.N., Jumanov M.A., Begjanov M.K., Sabirova Z.J., Erjanova D.M.
Karakalpak State University named after Berdakh

Summary: *In this article, about 1000 specimens of the fauna of the true wasp family were studied from more than 30 coordinate points of the Kyzylkum desert in 2020-2025. As a result of the analysis of the results obtained, 19 species and subspecies belonging to 3 subfamilies and 15 genera of the Vespidae family were identified in the region. Of the identified species, the species Polistes nimpha (Christ, 1791) was recorded for the first time in the fauna of Uzbekistan. It was decided to conduct separate studies on the species Dolichovespula sylvestris, which was recorded in the literature and not identified in the studies.*

Key words: *Hymenoptera, Kyzylkum desert, Vespid wasps, Eumeninae, Polistinae, Vespinae, new records.*

Introduction. Within the order Hymenoptera, the family Vespidae is distinguished by its ecomorphological characteristics and complex behavior. The existence of both solitary and gregarious species has attracted a number of researchers [1. 44]. According to the modern taxonomic status of true bees, approximately 5300 species belonging to six subfamilies and 256 genera are currently recognized in the world fauna [16. 226; 2. 181]. Like other families, the Vespid wasps were previously divided into three groups, with changes introduced in their taxonomy. These were divided into subfamilies: Vespidae, Masaridae, and Eumenidae. In modern taxonomy, all of them belong to the true wasp family. The following are considered solitary: Euparagiinae, Masarinae, and Eumeninae. The subfamilies Stenogastrinae, Vespinae, and Polistinae are considered gregarious [16. 221; 4. 20]. A number of studies have been conducted throughout Uzbekistan to study the true bee fauna. In the preliminary research conducted on true bees in Uzbekistan, André documented a mere five species during the years 1881-1886 [1. 35]. A subsequent study, conducted a decade later by Morawitz (1895), documented seven widespread species [20. 446]. In 1926, the scope of Białynicki-Birula's studies was restricted to a mere three species [3. 901].

It is evident that among the species identified, *Ancistrocerus dusmetiolus* and *Leptochilus chorezmicus* are the first to be recorded, and no other researcher has identified these species since that point. In 1970, Giordani Soika provided a comprehensive description of the bioecological characteristics of the *Katamenses sicheliide* species [10. 48]. By 1972, Van Der Vecht and Fischer had recorded the distribution of 28 species in their studies in this area. Davletshina et al. (1979) documented the extensive distribution of two species within the Kyzylkum Desert in Uzbekistan [6. 78]. In 1999, Kulumbetova recorded four species that were considered background species of the biocenosis [15. 66]. In the course of her research, Carpenter collated data on the distribution of 20 species. In 2010, Castro conducted a detailed study of 12 true bees [5. 42]. Of the species under consideration, four – namely Euodynerus dantici, Euodynerus fastidiosus, Euodynerus rufinus and Stenodynerus chitgarensis – have been recorded for the first time in this area. No other records of these species are extant, except for those made by the present author. Gusenleitner recorded 11 species over a period of almost 40 years [13. 98; 14. 132]. In 2012, Oehlke recorded three species: *Eumenes asiaticus, Eumenes pomiformis,* and *Stenancistrocerus transcaspicus* [21. 596]. Antropov et al. (2017) recorded 10 species in this area [2. 181]. Mokrousov, in 2015, provided various data - on 11 bee species [18. 41]. Among the mentioned species, *Ancistrocerus tenellus, Psiliglossa pulchra,* 2 species have not been recorded by any author from this region after the first recorded. Girish Kumar, et al. in 2019 recorded only one species, *Katamenses dimidiatus* [11. 18;]. Among the authors, Fateryga et al (2018, 2024), who studied the true bees of Uzbekistan in detail, studied the largest number of 55 true bee species in 2018 [7. 198; 8. 41; 9. 326]. In the work of the species recorded by

the author, 27 species were introduced for the first time for the fauna of Uzbekistan. In the work on the species recorded by the author, 27 species were introduced for the first time for the fauna of Uzbekistan. Thus, the total number of species identified by all authors consists of 122 species and subspecies [17. 421].

The primary objective of this article is to generate novel faunistic information derived from a meticulous examination of the Vespid fauna of the Kyzylkum Desert, specifically within the Vespidae family.

Materials and Methods

Kyzylkum, one of the largest deserts in the Turanian Plain, is located mainly between the Amu Darya and Syr Darya rivers. Kyzylkum district borders on the Lower Amu Darya district in the northwest, Lower Zarafshan district in the southeast, and Tashkent-Mirzachul district in the east. The southwest of the district coincides with the state border with Turkmenistan, and the northeast with Kazakhstan. Kyzylkum descends from the southeast to the northwest. Its average absolute height is 200-300 m, while in the southeast it drops to 350-400 m, and in the northwest it drops to 90-100 m.

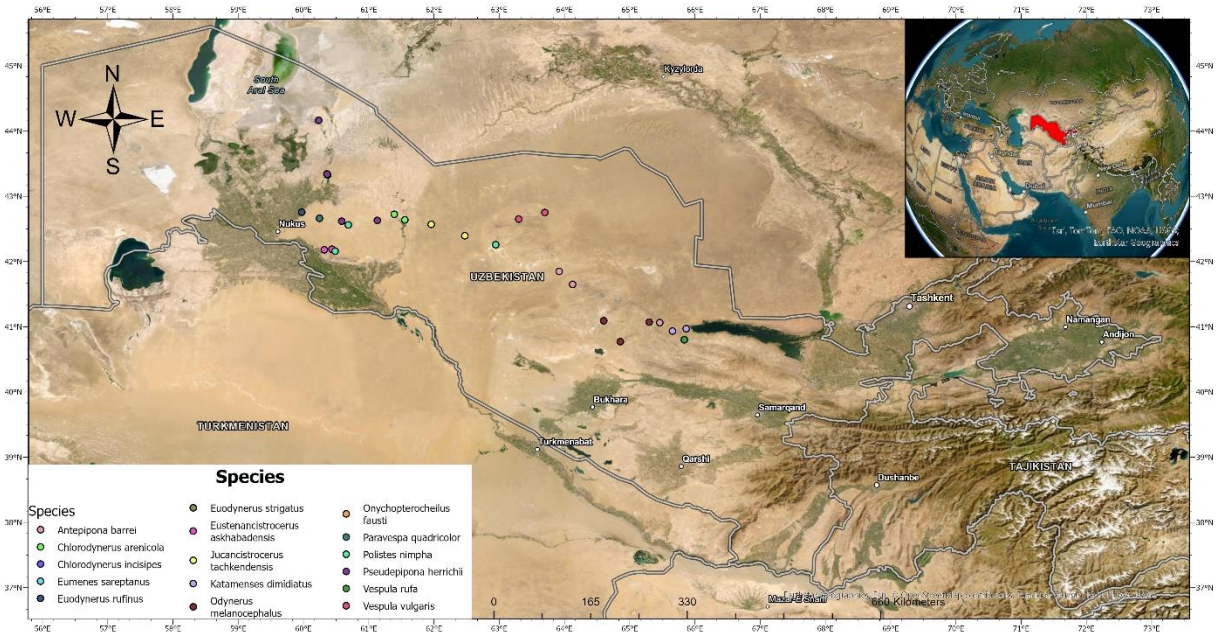

Figure 1. Geographical Map of Sample Collection Points

The Kyzylkum district is not uniform in terms of its topography. There are depressions, plains, flat plateaus and residual mountains. However, most of it is occupied by sandy plains with an absolute height of up to 200 m. Most of the plains are occupied by alluvial spreading sands, mainly eolian relief forms are Sand dunes have a more meridional direction and are reinforced with vegetation. Their relative height is 15-20 m, and sometimes their maximum height reaches 60-70 m. In the central parts of Kyzylkum, there are sand dunes, which are also reinforced. There are relatively few barkhans in Kyzylkum district, they are more often located in populated areas, around wells, on the shores of Amudarya, and their movement is related to human economic activity. The presence of bare soils in the Kyzylkum district is limited, such soils are found in low-lying areas between sand dunes.

Bare soils are covered with water in the spring months, and by the summer the water evaporates, as a result of which they dry out and harden, which leads to cracking.

Our research will be carried out in 2020-2025 from about 40 coordinate points in the natural and anthropogenic areas of the Kyzylkum desert of the Republic of Uzbekistan (Fig.1).

Figure 2. Kyzylkum desert of the Republic of Uzbekistan

When collecting materials, V.B. Golub (2012), V. Moericke (1951) and the traditional method of entomological nets [12. 67; 19. 24], Merrick plastic container, bushes, tree branches, residential and farm buildings, tweezers, a camera, etc. were used (Fig-2).

Biomaterials belonging to about 1000 real bees were collected. The coordinates of the samples were recorded in the Maps.me application and a map was created using the ArGIs Pro program. To identify the species composition of Vespidae bees, comparisons, catalogs and identifiers from the fund collections stored at the Institute of Zoology of the Academy of Sciences of the Republic of Uzbekistan were used. The morphological characteristics of the species were determined using a SMZ-161-TL microscope.

Results

The study of the fauna of the true wasp family was carried out in 2020-2025 in mainly non-irrigated areas of the Kyzylkum Desert, and partially in irrigated areas. As a result of the analysis of the results of the study, 19 species and subspecies belonging to 3 subfamilies and 15 genera of the

Vespidae family were identified (Table 1). The systematic status and faunistcal data of the identified species are presented below.

Vespidae - Family

Eumeninae – subfamily

***Antepipona* de Saussure, 1855 – genus**

1. *Antepipona barrei* (Radoszkowski 1893) – species. Fig. 2.1

Place and time of identification of the species: 1♀, 1♂. (N 63.91868095583991, Y 41.84954692240552), 20.05.2022; 2♀. (N 65.46242527868519 Y 41.06193517140839), 17.05.2022; 1♂. (N 64.12398082604486 Y 41.64898262065053) 18.05.2022; 2♀, 4♂. (N 64.85648752865521 Y 40.77230788664899) 26.06.2023.

Distribution: Armenia, Iran, Afghanistan, Tajikistan, Kazakhstan, Uzbekistan.

***Chlorodynerus* Blüthgen, 1951 genus**

2. *Chlorodynerus arenicola* (Kostylev, 1935) - species. Fig. 2.2.

Place and time of identification of the species: Kyzylkum desert, Karaozek district, Republic of Karakalpakstan 1♀, 1♂. (N 61.39217334518785 E 42.72188305758066), 17.06.2023; 2♀, 3♂. (N 61.55176304318125 Y 42.63875081756731), 17.06.2023; 1♀. (N 60.37323335847554 Y 43.32803431146164), 14.06.2023; 3♀, 3♂. (N 60.24671619137703 Y 42.66406210078632) 14.06.2023.

Distribution: China, Turkmenistan, Kazakhstan, Uzbekistan.

3. *Chlorodynerus incisipes* (Kostylev, 1935) - species. Fig. 2.3.

Place and time of identification of the species: 3♀, 2♂. (N 60.31852503795486, Y 42.18176934814461), 23.05.2024; 1♀, 4♂. (N 60.48316909168007 Y 42.16171245390667) 23.05.2024.

Distribution: Iran, Turkmenistan, Uzbekistan.

***Eumenes* Latreille, 1802 – genus**

4. *Eumenes sareptanus* André, 1884 - species. Fig. 2.4.

Place and time of identification of the species: 1♂. (N 59.97615033632654 Y 42.75565467164781), 23.05.2024; 2♀, 2♂. (N 60.36410266953806 Y 43.33710009351066) 23.05.2024.

Distribution: Western, Southern, and Eastern Europe, Russia (European part, Urals, Western Siberia), Turkey, Turkmenistan, Uzbekistan, Kazakhstan.

***Euodynerus* Dalla Torre, 1904 genus**

5. *Euodynerus strigatus* Radoszkowski 1893 - species. Fig. 2.5.

Place and time of identification of the species: 1♀, 4♂. (N 60.58620397439243 Y 42.61599660383926) 24.05.2022; 2♂. (N 61.13439408150873 Y 42.63137377097146) 24.05.2022; 2♀, 1♂. (N 59.97615033632654 Y 42.75565467164781), 23.05.2024.

Distribution: China, Central Asia, Tajikistan, Kazakhstan, Uzbekistan.

6. *Euodynerus rufinus* Blüthgen, 1942 - species. Fig. 2.6.

Place and time of identification of the species: 1♂. (N 60.58620397439243 Y 42.61599660383926) 24.05.2022; 1♂. (N 61.13439408150873 Y 42.63137377097146) 24.05.2022; 2♀, 3♂. (N 59.97615033632654 Y 42.75565467164781), 23.05.2024.

Distribution: Armenia, Israel, Egypt, Arabia, Iran, Turkmenistan, Mongolia, China, Kazakhstan, Uzbekistan.

***Eustenancistrocerus* Blüthgen, 1938 – genius**

7. *Eustenancistrocerus askhabadensis* (Radoszkowski, 1886) - species. Fig. 2.7.

Place and time of identification of the species: 2♀, 4♂. (N 60.31852503795486, Y 42.18176934814461), 23.05.2024; 1♀, (N 60.43751340573701 Y 42.18856678120513) 23.05.2024; 3♀, 2♂. (N 60.48316909168007 Y 42.16171245390667) 15. 08.2024; 1♀, 1♂. (N 59.97615033632654 Y 42.75565467164781) 17. 08.2024.

Distribution: Russia, Azerbaijan, Turkey, Syria, Jordan, Israel, Iran, Pakistan, Turkmenistan, Uzbekistan, Kazakhstan, Mongolia, China (North-West).

***Jucancistrocerus* Blüthgen, 1938 – genus**

8. ***Jucancistrocerus tachkendensis*** **(Dalla Torre, 1889) - species. Fig. 2.8.**

Place and time of identification of the species: 3♂. (N 61.95803912377802 Y 42.56761944314907), 15.06.2023. 2♀, 1♂. (N 62.47216071039457 Y 42.39620155179878), 24.06.2023.

Distribution: China, Afghanistan, Pakistan, Turkmenistan, Kazakhstan, Uzbekistan.

Katamenes **Meado Waldo, 1910 – genus**

9. ***Katamenses dimidiatus*** **Brulle, 1832 - species. Fig. 2.9.**

Place and time of identification of the species: 1♀, (N 65.83664082470418 Y 40.80121683620003), 17.05.2022; 4♀, (N 65.86463004539483 Y 40.97076299690683), 17.05.2022; 2♀, 2♂. (N 65.65517174796395 Y 40.93413263206056), 27.06.2023.

Distribution: Europe, Russia, Caucasus, Turkey, Cyprus, Syria, Israel, Iran, Mongolia, China, Afghanistan, Pakistan, Central Asia, Kazakhstan.

Odynerus **Latreille, 1802 – genus**

10. ***Odynerus melanocephalus*** **(Gmelin, 1790) - species. Fig. 2.10.**

Place and time of identification of the species: 3♀, 4♂. (N 64.85648752865521 Y 40.77230788664899) 26.06.2023; 1♀, 2♂. (N 65.2997013764403 Y 41.07313827904636) 17.05.2022; 1♀, 2♂. (N 64.60468036467203 Y 41.09033962261461) 17.05.2022.

Distribution: N. Africa, almost all of Europe (except the Perenean Peninsula), the Caucasus, Kazakhstan, Central Asia, South Siberia, Iran, Palestine.

Onychopterocheilus **Bluthgen, 1955 genus**

11. ***Onychopterocheilus fausti*** **(Moravitz, 1873) - species. Fig. 2.11.**

Place and time of identification of the species: 1♀, 1♂. (N 60.37323335847554 Y 43.32803431146164), 27.05.2022; 1♀, 3♂. (N 60.35942556971107 Y 43.34230314197199) 14.06.2023.

Distribution: Central Asia.

Paravespa **Radoszkoowski, 1886 – genus**

12. ***Paravespa quadricolor*** **(Moravitz, 1885) - species. Fig. 2.12.**

Place and time of identification of the species: 3♀, 3♂. (N 60.36724119128425 Y 43.3323281375823), 27.05.2022. 1♀, 2♂. (N 60.24671619137703 Y 42.66406210078632) 14.06.2023.

Distribution: Central Asia, Kazakhstan.

Pseudepipona **Saussure, 1856 – genus**

13. ***Pseudepipona herrichii*** **De Saussure, 1856- species. Fig. 2.13.**

Place and time of identification of the species: 4♀, 6♂. (N 60.36410266953806 Y 43.33710009351066) 23.05.2022; 2♀, 3♂. (N 60.58620397439243 Y 42.61599660383926) 17.06.2023. 2♂. (N 61.13439408150873 Y 42.63137377097146) 24.05.2024.

Distribution: Europe (WE, SE, EE), Russia, North Africa, Caucasus, Turkey, Syria, Mongolia, China, North America, Central Asia, Kazakhstan.

Polistinae – subfamily

Polistes **Latreille, 1802 genus**

14. ***Polistes watti*** **Cameron 1900 - species. Fig. 2.14.**

Place and time of identification of the species: Found in all parts of the Kyzylkum Desert. 127♀, 189♂.

Distribution: Arabian Peninsula, Mauritius, Iraq, Iran, Afghanistan, Pakistan, China, India, Kazakhstan, Tajikistan, Turkmenistan, Uzbekistan.

15. ***Polistes nimpha*** **(Christ, 1791) - species. Fig. 2.**

Place and time of identification of the species: 1♂. (N 60.48316909168007 Y 42.16171245390667) 23.05.2024; 2♂. (N 60.68579847958387 Y 42.56224599066014) 17.06. 23. 1 ♂. (N 62.94612813792256 Y 42.25813227412003.16.06.2023.

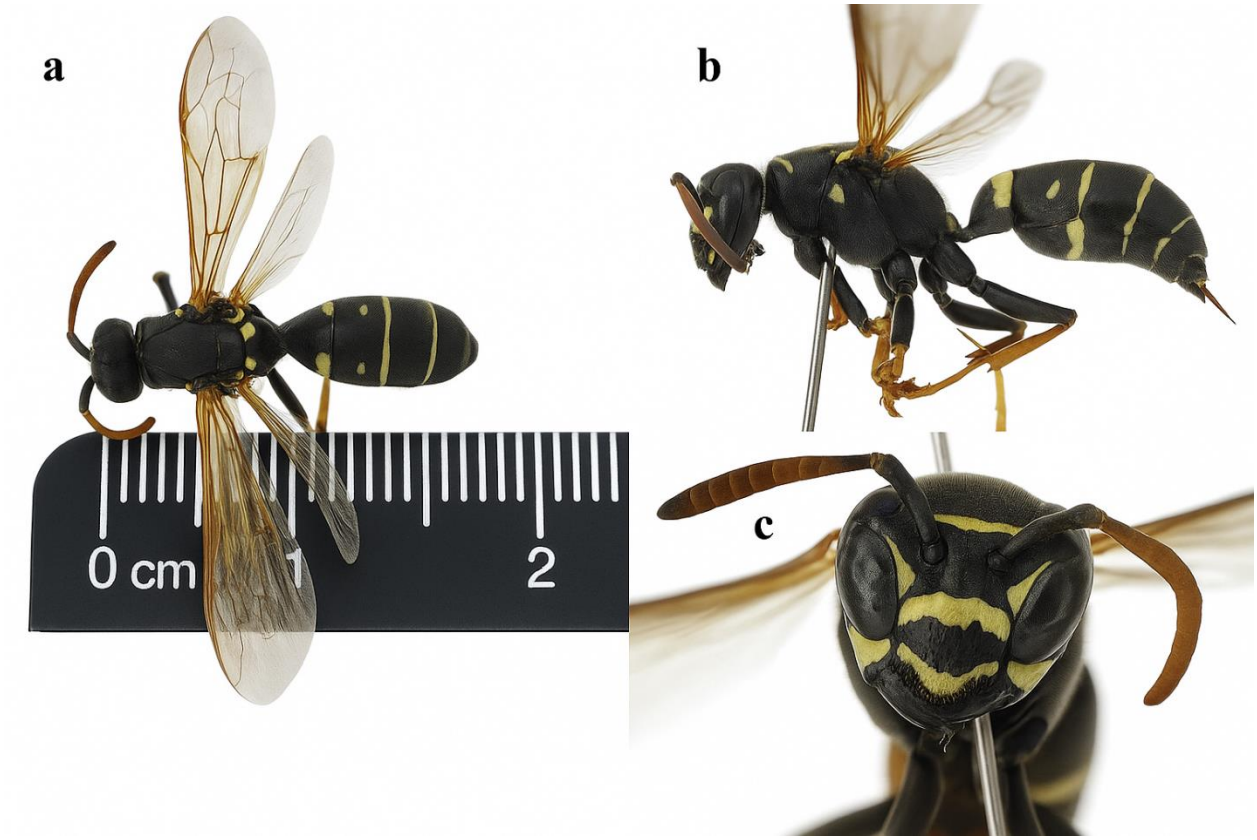

Figure 2. First recorded ♂ *Polistes nimpha* (Christ, 1791) in Uzbekistan. a) Habitus, lateral view; b) Habitus, dorsal view; c); Head, frontal view [Images by D.Musaev and M.Medetov]

The transverse yellow band on the pronotum. It is narrowed dorso-laterally and slightly widened ventrally, with the mesoscutum usually lacking any yellow markings.The scapus is generally dark brown to blackish on the baso-ventral surface. The apical half of the hypopygium is often entirely black or dark brown, occasionally bearing a small yellow spot, and more rarely, the apical quarter may be yellow. Paired yellow spots on the mesoscutum are usually absent, but when present, they are minute or of moderate size. The apical half of the antenna is typically darkened dorsally. Posterolateral yellow bands on the pronotum are usually continuous with the anterior transverse band. The anterior transverse band itself is medio-laterally narrower than at the dorso-lateral margins. Yellow markings on the mesoscutum are sometimes absent.

Distribution: Europe (Western, Northeastern, Southeastern, Eastern Europe), North Africa, Armenia, Israel, Jordan, Georgia, Azerbaijan, Iraq, Russia, Turkey, Iran, Pakistan, Mongolia, Northeastern China, India, Kyrgyzstan, Kazakhstan, *Uzbekistan.

*Recorded for the first time for the fauna of Uzbekistan.

Vespinae – subfamily

***Vespa* Linnaeus, 1758 – genus**

16. *Vespa orientalis* Linnaeus, 1771 - species. Fig. 2.15.

Place and time of identification of the species: Found in all parts of the Kyzylkum Desert. 32♀, 49♂.

Distribution: Europe, North Africa, Arabian Peninsula, Crete and Cyprus, Asia Minor, Middle East, Caucasus, Transcaucasia, Russia, China, Iran, Iraq, Afghanistan, Pakistan, India, Nepal, Ethiopia, USA, Mexico, several European countries, Southeast Asia, Lebanon, Syria, Jordan, Israel, Saudi Arabia, Bahrain, Yemen, Oman, Nepal, Madagascar, Southern Turkey, Armenia, Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, Uzbekistan.

***Dolichovespula* Rohwer, 1916 – genus**

***Vespula* Thomson, 1869 – genus**

17. *Vespula germanica* Fabricius, 1793 - species. Fig. 2.17.

Place and time of identification of the species: 4♀, 6♂. (N 65.01367125668651 Y 40.96225216546127) 17.05.2022; 2♀, 3♂. (N 64.52993572428258 Y 41.23757781529378) 27.06.2023. 2♂. (N 64.34155950794151 Y 42.63137377097146) 19.07.2024.

Distribution: Europe, Russia, Siberia, Altai, Far East, Baikal, Beyond Baikal, North Africa, Israel, Jordan, Lebanon, Iceland, Georgia, Armenia, Turkey, Caucasus, Middle East, Syria, Iran, Iraq, Pakistan, China, Mongolia, Korean Peninsula, North India, South Africa, Australia, Iceland, Tasmania, New Zealand, North and South America, Argentina, Chile, Afghanistan, Kazakhstan, Tajikistan, Turkmenistan, Uzbekistan.

18. *Vespula rufa* Linnaeus, 1758 - species. Fig. 2.18.

Place and time of identification of the species: 1♀, 1♂. (N 65.83664082470418 Y 40.80121683620003) 17.05.2022.

Distribution: Central and Northern Europe, North America, Russia, Caucasus, Sakhalin, Island, Japan, Korean, North China, Mongolia, Iran, Crimea, Turkey, Taiwan, Georgia, Nepal, Kazakhstan, Kyrgyzstan, Turkmenistan, Uzbekistan.

19. *Vespula vulgaris* Linnaeus, 1758 - species. Fig. 2.19.

Place and time of identification of the species: 1♀. (N63.800000 Y42.600000) 9.06.2024; 1♀. 1♂. (N63.500000 Y 42.700000) 9.06.2024; 1♂. (N 63.300000 Y 42.650000)10.06.2024; (N63.900000 Y 42.550000) 10.06.2024; 2♀, 1♂. (N 63.699991 Y42.749992)10.06.2024.

Distribution: Europe, Russia, Turkey, Georgia, Iran, Mongolia, China, Korean Peninsula, Japan, India. Iceland, New Zealand, Australia, Kyrgyzstan, Kazahkstan, Uzbekistan.

The identified species were identified as belonging to 3 subfamilies (Eumeninae, Polistinae, Vespinae) of the Vespidae family. Regarding the distribution among subfamilies, the Eumeninae subfamily is the leader with 13 species (68.4%), the Vespinae subfamily is second with 4 species (21.05%), and the Polistinae subfamily is third with 2 species (10.5%) (Table 1).

Table 1

Species composition of the Vespidae family identified from the Kyzylkum Desert

Family	Subfamily	Genus	Species
Vespidae	Eumeninae	*Antepipona* de Saussure, 1855	*Antepipona barrei* (Radoszkowski 1893)
		Chlorodynerus Blüthgen, 1951	*Chlorodynerus arenicola* (Kostylev, 1935)
			Chlorodynerus incisipes (Kostylev, 1935)
		Eumenes Latreille, 1802	*Eumenes sareptanus* André, 1884
		Euodynerus Dalla Torre, 1904	*Euodynerus strigatus* Radoszkowski 1893
			Euodynerus rufinus Blüthgen, 1942
		Eustenancistrocerus Blüthgen, 1938	*Eustenancistrocerus askhabadensis* (Radoszkowski, 1886)
		Jucancistrocerus Blüthgen, 1938	*Jucancistrocerus tachkendensis* (Dalla Torre, 1889)
		Katamenes Meado Waldo, 1910	*Katamenses dimidiatus* Brulle, 1832
		Odynerus Latreille, 1802	*Odynerus melanocephalus* (Gmelin, 1790)
		Onychopterocheilus Bluthgen, 1955	*Onychopterocheilus fausti* (Moravitz, 1873)
		Paravespa Radoszkoowski, 1886	*Paravespa quadricolor* (Moravitz, 1885)
		Pseudepipona Saussure, 1856	*Pseudepipona herrichii* de Saussure, 1856
	Polistinae	*Polistes* Latreille, 1802	*Polistes watti* Cameron 1900
			Polistes nimpha (Christ, 1791)
	Vespinae	*Vespa* Linnaeus, 1758	*Vespa orientalis* Linnaeus, 1771
		Vespula Thomson, 1869	*Vespula germanica* Fabricius, 1793
			Vespula rufa Linnaeus, 1758
			Vespula vulgaris Linnaeus, 1758
Total:	**3**	**15**	**19**

A study of the species belonging to the genera of the Vespidae family revealed that the most numerous genus, Vespula, comprises three species (15.8%). It is evident that Chlorodynerus, Euodynerus and Polistes each possess two species, representing 10.5% of the total. Antepipona,

Eumenes, Pseudepipona, Jucancistrocerus, Eustenancistrocerus, Katamenes, Odynerus, Onychopterocheilus, Paravespa, Pseudepipona and Vespa have one species each (5.3%).

Discussion. Despite the fact that a number of studies have been conducted on the fauna and species composition of true bees in the areas adjacent to the Kyzylkum Desert in Uzbekistan, the study of true bees in the Kyzylkum Desert region is limited to the data presented by A.G. Davletshina et al (1979). In his research conducted by Davletshina in 1979, he mentioned 3 species: *Vespa orientalis, Dolichovespula sylvestris* and *E. laeri* Red. (unknown), which belong to the genus Eumenes. Of these species, *Dolichovespula sylvestris* was not collected in our research. The species mentioned as belonging to the genus *Eumenes*, we recognize as the widespread species *Eumenes sareptanus* in our research. Of the 19 species identified in our study, 1 species, *Polistes nympha* (Christ, 1791), was recorded for the first time in the fauna of Uzbekistan.Other 16 species, such as *Antepipona barrei, Chlorodynerus arenicola, Ch. incisipes, Euodynerus strigatus, E.rufinus, Eustenancistrocerus askhabadensis, Jucancistrocerus tachkendensis, Katamenses dimidiatus, Odynerus melanocephalus, Onychopterocheilus fausti, Paravespa quadricolor, Pseudepipona herrichii, Polistes watti, Vespula germanica, Vespula rufa, Vespula vulgaris*, were recorded for the first time for the Kyzylkum region. Thus, according to the literature and research results, the true wasps of the Kyzylkum desert in the territory of the Republic of Uzbekistan are 20 species belonging to 3 subfamilies and 16 genera.

Acknowledgements: We would like to express our gratitude to Embergenov Muratbay Amanbaevich (Centre for Termite Control at the Institute of Zoology of the Academy of Sciences of the Republic of Uzbekistan) for his assistance in species identification. This research was supported by the project “I-2.2: Fauna of Hymenoptera (Hymenoptera: Aculeata) in Natural and Anthropogenic Areas of Bukhara and Navoi Regions”, conducted by the Entomology Laboratory of the Institute of Zoology, Academy of Sciences of the Republic of Uzbekistan.

Conclusion. In conclusion, research on the true bee fauna of the Kyzylkum Desert was conducted during 2020-2025. As a result of the analysis of the research results, 19 species and subspecies belonging to 3 subfamilies and 15 genera of the Vespidae family were identified. Of the identified species, the species *Polistes nympha* (Christ, 1791) was recorded for the fauna of Uzbekistan and 16 species for the Kyzylkum region for the first time. The species *Dolichovespula sylvestris*, which was recorded in the literature, was not included in our research, and together with the literature data, the list of true bees of the region was reduced to 20 species.

MATHEMATICAL FOUNDATIONS OF CRYPTOGRAPHY

Berdimuratov M.K.
Karakalpak State University name after Berdakh

Summary: *This paper examines the mathematical foundations of modern cryptographic systems. The focus is on number theory, algebraic structures, and probabilistic methods, which underlie encryption, digital signatures, and key exchange protocols. Key cryptographic algorithms, including RSA, elliptic curves, and discrete logarithm-based algorithms, are discussed, along with their mathematical justification and vulnerabilities.*

Key words: *cryptography, number theory, algebraic structures, modular arithmetic, elliptic curves, RSA, discrete logarithm, digital signature, data confidentiality, information security*

Cryptography is a key discipline of modern information security, ensuring confidentiality, integrity, and authentication of data in digital systems. As computing technologies and global communication networks develop, the demand for reliable methods of data protection continues to grow. All modern cryptographic algorithms rely on strictly defined mathematical constructions and problems that are difficult to solve from the standpoint of computational complexity.

The main objective of cryptography is to create algorithms that allow information to be transmitted securely even in the presence of potential adversarial monitoring. To achieve this, methods from number theory, modular arithmetic, algebraic structures, probabilistic approaches, and information theory are used.

In today's information society, data protection has become one of the key conditions for the secure operation of government institutions, banking systems, corporate networks, and personal communications. With the increasing level of digitalization and network technologies, the number of threats related to unauthorized access, data forgery, and tampering is growing significantly. In these conditions, cryptography acts as a fundamental field that ensures confidentiality, integrity, and authenticity of information.

Cryptographic methods are based on strict mathematical models and computational algorithms. The foundations of modern cryptography are rooted in number theory, abstract algebra, probability theory, and discrete mathematics. It is precisely the existence of mathematically complex or computationally infeasible inverse problems that ensures the stability of cryptosystems and renders direct computational attacks impractical.

Historically, cryptography long predates computers. Its initial purpose was to protect communication in state and military correspondence. Early ciphers were based on simple substitution and permutation methods, such as the Caesar cipher.

With the development of computing, cryptography acquired a rigorous mathematical basis, and the security of information began to be evaluated in terms of computational complexity. Today, cryptography is used in banking systems, e-commerce, digital documentation, and many other fields.

Modern cryptography relies on fundamental mathematical concepts, among which number theory, abstract algebra, and computational complexity theory play a key role. These fields form the basis for constructing one-way functions, encryption algorithms, and key distribution protocols. As noted by W. Stallings, mathematical rigor makes it possible to formally prove cryptographic strength rather than rely on heuristic assumptions [1].

One of the fundamental concepts of modern cryptography is the one-way function — a mapping that is easy to compute but hard to invert when only the output is known [2]. An example of such a function is the RSA system, which relies on the computational difficulty of factoring large composite numbers. The security of RSA is based on the infeasibility of factoring the product of two large primes in reasonable time [3].

Another key area is cryptography based on the discrete logarithm problem. The Diffie–Hellman protocol shows that two users can securely agree on a shared key over an open communication channel if an adversary cannot solve the discrete logarithm problem in the chosen

group [4]. This approach is widely used in modern TLS protocols and secure network communications.

In recent decades, elliptic curve cryptography has seen significant development. Cryptosystems based on elliptic curves provide comparable security with much shorter key lengths, making them particularly effective for high-performance and mobile computing systems [5]. While RSA typically requires keys of 2048 bits or more, ECC ensures equivalent security with keys of about 256 bits.

Thus, the mathematical foundations of cryptography determine both the structure of cryptographic algorithms and the criteria for their resistance. The development of new technologies, including quantum computing, necessitates further improvement of mathematical methods and the search for new problems whose difficulty will remain resilient to quantum attacks [1; 5]. Therefore, studying the theoretical foundations of cryptography is an essential condition for ensuring long-term information security.

To effectively apply cryptography (both to implement secure cryptographic tools and to analyze their resistance), it is necessary to develop efficient methods and algorithms for:

• primality testing;

• searching for large prime numbers (typically numbers with more than 80–90 decimal digits are used);

• integer factorization.

Factorization is the decomposition of a natural number into prime factors. This problem has high computational complexity. One of the most widely used public-key methods, RSA, is based on the hardness of factoring large integers.

The challenge posed to the mathematical community by the creators of RSA led to the development of the fastest known factorization methods in the 1980s and 1990s:

• Lenstra's elliptic curve method (1987);

• Pollard's number field sieve (1993);

• Pomerance's quadratic sieve (1996).

Currently, research in fast factorization algorithms continues intensively worldwide.

It should be noted that computer progress has both technological and algorithmic aspects. Even with the best computing equipment, without modern algorithms we would not be able to factor numbers longer than 40 digits.

Number theory plays a key role in cryptography, especially in public-key algorithms.

Prime numbers are used for key generation.

Euler's totient function φ(n) determines the number of integers that are relatively prime to *n*.

Integer factorization refers to the problem of recovering the prime factors of a composite number.

In the RSA algorithm, two large prime numbers p and q are used. Their product $n = p \cdot q$ serves as a public parameter, but factoring n back into p and q is extremely difficult when the numbers are large, which ensures the security of RSA.

Number theory is a fundamental mathematical basis of modern cryptography, especially public-key cryptosystems. It studies the properties of integers and operations on them, as well as problems whose computational complexity determines the security of cryptographic algorithms.

One of the key concepts is the prime number — a natural number that has exactly two divisors: 1 and itself. In cryptographic algorithms, extremely large prime numbers (512, 1024, 2048 bits or more) are used, since operations with them can be performed efficiently, while the inverse problems turn out to be extremely difficult.

An important role is played by Euler's totient function φ (n), which determines the number of integers that are relatively prime to *n*. For the product of two prime numbers p and q, the value of the function is:

$$\varphi(p\ q) = (p-1)\ (q-1).$$

This property is used in constructing the private key in the RSA algorithm.

Factorization as the Basis of Cryptographic Security

The security of many cryptosystems is based on the difficulty of factoring a large composite number into its prime components. For example:

$$n = p \cdot q,$$

where p and q are large prime numbers.

If p and q are known, computing the private key is straightforward.

However, if only n is known, determining p and q is practically infeasible with current computational capabilities.

Example:

If the number n has a length of **2048 bits,** brute-force factorization would require millions of years, even on modern supercomputers.

The Discrete Logarithm Problem

Another important problem in number theory is the discrete logarithm problem, which is formulated as:

$$a^x \equiv b \pmod{n}.$$

The goal is to determine x, given a, b, and n.

For sufficiently large n, this problem becomes computationally difficult, making it the basis for the security of many cryptographic protocols.

It is required to find **x**, given **a**, **b**, and **n**.
For large values of **n**, this problem becomes computationally difficult.
The Diffie–Hellman algorithm and elliptic curve cryptography are based on this principle.

Modular arithmetic plays an important role in cryptography, as most cryptographic operations are performed within finite numerical systems. The main idea is that numbers are considered not on an infinite number line, but within a limited range in which values repeat cyclically. This approach ensures mathematical rigor and stability of cryptographic computations.

Two integers **a** and **b** are said to be congruent modulo **n** if they give the same remainder when divided by **n**:

$$a \equiv b \pmod{n}.$$

For example:

$$17 \equiv 2 \pmod{5},$$

since:

$$17 = 5 \cdot 3 + 2.$$

Modular Arithmetic Operations

All standard arithmetic operations—addition, subtraction, and multiplication - are correctly transferred into the modular system:

$(a + b) \bmod n = (a \bmod n + b \bmod n) \bmod n,$

$(a \cdot b) \bmod n = (a \bmod n \cdot b \bmod n) \bmod n.$

This allows computations with very large numbers without exceeding the permissible range of values, which makes modular arithmetic convenient for use in digital systems.

One of the most important and frequently used operations is modular exponentiation:

$$c = a^k \bmod n.$$

For large values of k, this operation is performed using the fast exponentiation algorithm, which significantly reduces computational costs.

While computing the result of exponentiation modulo n is relatively easy, the inverse operation - finding the exponent - is known as the discrete logarithm problem, which is computationally difficult. This property ensures the security of many cryptographic protocols.

For example:

$$a^x \equiv b \pmod{n}$$

Finding x for large values of a, b, and n is practically impossible with current computational resources.

Thus, modular arithmetic is a fundamental basis of cryptography, as it allows the construction of algorithms that are easy to compute in one direction but are practically impossible to reverse.

One-way functions play a key role in cryptography because they enable transformations that are easy to perform in the forward direction, yet extremely difficult to invert. This means that given the input data and the computation algorithm, the result can be obtained efficiently, but recovering the original input from the result without additional information is extremely difficult.

A one-way function is a function that is easy to compute but very hard to invert.

Example of a one-way function:

$$f(x) = x^e \bmod n.$$

When x, e, and n are known, computing $f(x)$ is straightforward. However, performing the inverse operation is directly related to the factorization of n, which is a computationally difficult problem.

One-way functions form the foundation of:

• public-key encryption algorithms (for example, RSA),

• key exchange protocols (such as Diffie–Hellman),

• digital signatures and data authentication mechanisms.

Hash functions are special types of one-way functions that transform input data of arbitrary length into a fixed-length bit sequence called a hash or hash value.

Notation:

$$h = H(M),$$

where M is the message, H is the hash function, and h is the resulting hash code.

Modern cryptography is based on mathematically grounded algorithms that ensure the protection of information during transmission and storage. These methods can be divided into two major categories: symmetric and asymmetric cryptosystems. In addition, key exchange protocols and elliptic curve cryptography play an important role.

Symmetric cryptosystems use the same key for both encryption and decryption (for example, AES).

Asymmetric cryptosystems use a pair of keys - a public key and a private key (for example, RSA).

The Diffie–Hellman protocol enables secure key exchange, and elliptic curve cryptography (ECC) provides a high level of security with significantly shorter key lengths.

In symmetric cryptography, the same key is used to encrypt and decrypt data. This type of encryption is characterized by high processing speed and is used in systems where large volumes of data must be encrypted.

The most widely used symmetric algorithm is AES (Advanced Encryption Standard). Key characteristics of AES include:

• a block cipher with a block size of 128 bits;

• key lengths of 128, 192, or 256 bits;

• operations performed over the finite field $GF(2^8)$

AES is used in banking systems, wireless networks, HTTPS protocols, and modern messaging applications.

In asymmetric cryptosystems, a pair of keys is used:

• the public key, which is available to all users;

• the private key, which must be kept confidential.

Encryption is performed using the public key, while decryption is carried out using the private key. This approach ensures a high level of security when transmitting data over open communication channels.

The most well-known algorithm is RSA. Its security is based on the difficulty of factoring a large number $n = p \cdot q$, where p and q are large prime numbers. RSA is widely used for digital signatures and for securing network connections (TLS/SSL).

The Diffie–Hellman protocol is designed to securely establish a shared secret key between two users. The key itself is not transmitted over the network. The security of the protocol relies on the computational difficulty of solving the discrete logarithm problem.

Diffie–Hellman is used in VPN, SSH, and in messaging applications with end-to-end encryption (for example, Signal and Telegram Secret Chat).

Elliptic curve cryptography (ECC) provides the same level of cryptographic security as RSA, but with a much shorter key length, making it more efficient for modern systems, especially mobile and embedded devices.

Algorithm	**Key Length**	**Security Level**
RSA	2048 bits	high
ECC	256 bits	equally high

Thanks to the compact key sizes, ECC (Elliptic Curve Cryptography) is particularly effective in mobile devices, blockchain systems, and digital signature schemes (such as ECDSA and ECDH).

The development of computing technologies makes the use of modern cryptographic algorithms a necessary condition for protecting information. Symmetric ciphers provide high processing speed, asymmetric systems ensure secure key exchange, Diffie–Hellman protocols provide a trusted communication channel, and elliptic curves offer strong security while minimizing computational resource usage.

Cryptography is a critically important tool for information protection. Based on mathematical principles, it allows data to be securely protected even under conditions of increasing computational power and emerging cyber threats. In the future, the evolution of cryptography will be closely linked to the need to counter quantum computing and develop new algorithms resistant to quantum attacks.

A deep professional understanding of cryptographic algorithms, as well as their evaluation in terms of security, efficiency, and potential vulnerabilities, requires a solid mathematical foundation. This is because modern cryptography relies on fundamental results from fields such as computational complexity theory, number theory, abstract algebra, and other related areas. The material presented contains key concepts from number theory and algebra that form the basis for learning the principles and methods of modern cryptography.

"THE OTHER SIDE" OF IRRIGATION: THE BIOACCUMULATION OF POLLUTIONS IN THE SUDOCHYE AND JULTURBAS LAKES AS A RISK FACTOR FOR THE ECOSYSTEM

Xojamuratova R.T, Kalenderova K.T.

Summary: *In the context of intensive irrigation work and the growth of collector-drainage runoff in the Southern Aral Sea region, an increase in the inflow of pollutants into surface water bodies is observed. The Sudochye and Julturbas lakes, which are important elements of the Amu Darya delta's hydro-ecological system, experience increased anthropogenic load due to the accumulation of biogenic elements, heavy metals, and salts entering with irrigation and drainage water. The work examines the mechanisms of bioaccumulation of pollutants in hydrobionts and bottom sediments, and analyzes the ecosystem consequences of this process. It has been shown that the long-term increase in mineralization, concentrations of chlorides, sulfates, cadmium, lead, and zinc forms sustainable ecological hazard zones, reduces biodiversity, disrupts food chains, and threatens the reproduction of fish resources. Based on the analysis of the data, recommendations are proposed for minimizing the negative impact of irrigation flows and improving hydro-ecological monitoring.*

Key words: *irrigation; collector-drainage waters; bioaccumulation; heavy metals; mineralization; pollution; Lake Sudochye; Lake Julturbas; hydro-ecology; Southern Aral Sea region; ecosystem risks; environmental sustainability.*

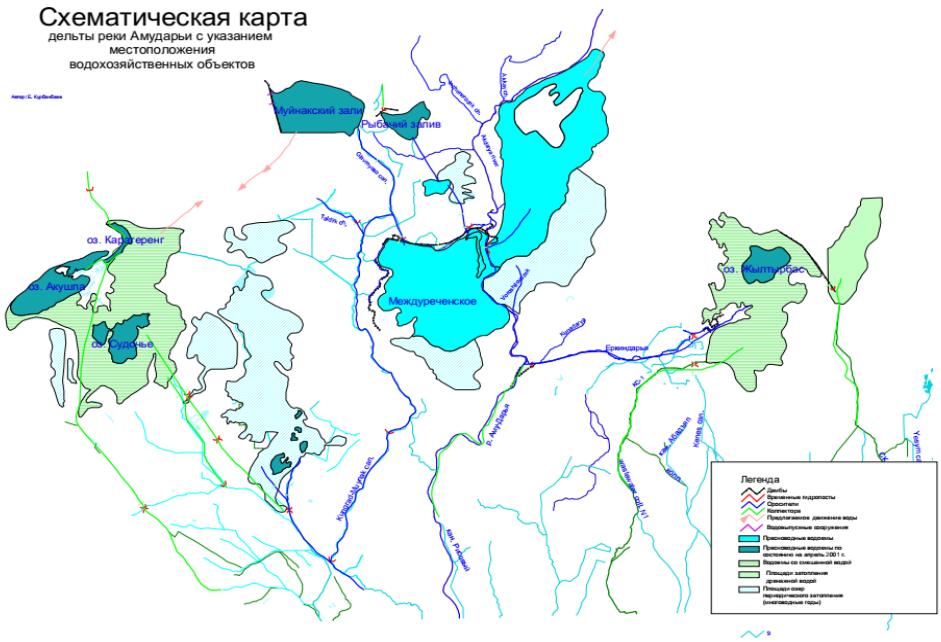
The tragedy of the disappearance of the Aral Sea is one of the most convincing and vital arguments against the unbalanced and unsustainable actions of the human race, which were so numerous during the second half of the 20th century, both constructive and simultaneously destructive. During this half-century period, humanity not only reached unprecedented heights in technological development but also caused more damage to nature than ever before. This predatory violence against the planet was caused by the rapid technological revolution, which was declared a turning point in human history at one time. This continued until the best minds discovered that there were very serious consequences behind its facade.

Humanity's ambitious aspiration has caused almost all global climatic, hydrological, and geological changes (and not only in former socialist countries), which manifested in the greenhouse effect, the loss of rivers, lakes, and wetlands, and the widespread desertification. Today, the people and governments of countries like Canada, Holland, Switzerland, and Japan, which are setting an example for all humanity in how to restore their relationship with nature, should receive recognition and respect. This is evident in how urbanization is combined with the protection of fauna, flora, and landscapes based on the harmonization of conflicting interests such as economic development, demographic growth, and even increasing natural potential in this process. The awareness of humanity's partnership with nature, based on deep respect for it and pride in natural resources, is instilled from childhood and derived from understanding its essence.

With a wonderful and truly caring attitude that inspires French, Swiss, and Dutch specialists, managers, and representatives of public organizations in their struggle for Granting nature its rights in harmony with the needs of development.

The revival of the Rhône vet lands on the Mediterranean coast, the restoration of the salmon population as a result of the clearing of the Rhône, the presence of a huge number of polders, their The beautiful grandeur combined with natural protected areas in Holland, Switzerland's protected landscapes around Zurich and Lucerne are just a few inspiring examples that we all must follow (Science for Peace Project, Tashkent -2003).

The drying up of the Aral Sea, formerly a vast body of water with good water quality, has reached such a level that the widespread nature degradation within the drying zone (below 53 m), as well as beyond it, has led to a situation where the region is now characterized as a disaster area. The sea, which served as a source of rich flora and fauna and a natural regulator for the adjacent irrigated



area, is in such a state of decline that a desertification zone is formed, located between the Kyzylkum, Karakum, and Ustyurt deserts. Seas have appeared on the former bottom vast salt marshes, heavily saline lands, foci of salt-dust outcrops.

In the coastal zone (above 53 m), the ecosystem of the delta and coastal strip, formed over many centuries, was completely destroyed, lakes dried up, water mineralization increased, salt marshes appeared in the place of dried-up swamps, fishing and fur-bearing animals decreased significantly, migratory birds disappeared, flora and fauna are declining, and the local climate underwent changes. The Aral Sea ecological crisis, caused by the large-scale and unregulated seizure of river runoff for irrigation in Central Asia since the 1960s, remains one of the most acute global problems. The catastrophic drop in sea level led to its splitting into isolated bodies of water, the drainage of vast territories, and the formation of the Aralkum salt desert.

Before the crisis began, the landscape of the Southern Aral Sea region was a different picture. The Amu Darya River delta was formed under the influence of long-term natural fluctuations in river flow, resulting in the formation of a unique delta landscape and its hydrological and hydrogeological profile with numerous reservoirs under the influence of various processes of marine, river nature, and erosion dynamics. Thus, the natural stability and biodiversity of the delta were entirely dependent on the full flow of the river and periodic floods. The sharp and large-scale decrease in river water inflow due to irrigation boom disrupted this natural connection, leading to the disappearance of most bodies of water and critical salinization of the remaining ones (Sudochye, Julturbas), completely changing their hydrological regime.

Amudarya's flow, under the influence of river regulation by reservoirs (Nurek, Baypaza, Tuyamuyun), combined with several large intra-system reservoirs on the Amubuhar, Karakum, and Karshi canals, received some (78... 81%) and the degree of regulation, which significantly changed the hydrological regime of the lower reaches of the river. The development of irrigation in the Amu Darya basin and, accordingly, the increase in the volume of irreversible water intake led to a sharp decrease in water inflow into the delta. Due to insufficient provision of optimal water-salt exchange in delta lakes . The quality of water and, accordingly, the overall ecological situation began to deteriorate. The retreat of the sea and the loss of natural connection with its bays led to the disappearance of the delta's marine nutrition and its complete dependence on the regime of water inflow from the river.

As a result of the constant decrease in this inflow since 1960, lakes began to play the role of natural evaporators, sharply reducing the volume of water in them and, consequently, increasing its mineralization. The main factor of the hydrological state of the delta is the inflow of water through. Amudarya river and less significant, but still important - the inflow of water through collectors feeding some lakes in mixed with fresh water or independently. The characteristic of river flow variability is given by the river water hydrograph in the Samanbay channel (the end hydro post on the river at the mouth of the modern delta), which fluctuated over a 22-year period from 330 million m3 per year (1982) to 24 million 272 million m3 per year in 1992 (Figure 3-1).

Accordingly, the area of water bodies, their biological and economic productivity, changed. Currently, all existing water bodies in the Amu Darya delta can be divided into 2 parts according to their feeding regime (Figure 1).

a) lakes existing on collector-drainage waters (Sudochye, Western Karateren, Akushpa, Eastern Karateren, partly Julturbas, etc.);

b) lakes fed by the Amu Darya River (Mezhdurechensk , Dautkul, Ribache, Muynak, Dumalak, etc.)

In high-water years, these lakes were almost completely drained by abundant river runoff, acquiring the properties of flowing bodies of water. During periods of reduced freshwater inflow during low-water periods, these lakes were partially flooded by seawater, resulting in a sharp change in the physical and chemical properties of the water, corresponding changes in their flora and fauna and biological productivity.

In this context, the delta lake systems of the Southern Aral Sea region, which include Sudochye and Julturbas (located in the territory of Karakalpakstan, Uzbekistan), have acquired critical importance. They are the last large reservoirs preserved in the Amu Darya delta, playing the role of a natural biological reserve and a key link in the global migration of waterfowl (Sudochye Lake has the status of Ramsar land). For many decades, the Karateren, Akchakul, Sudochye, and Kokchiel lakes have been used as water intakes for wastewater and drainage water from irrigated lands. In the near future, if fresh water supply is not restored, these lakes will not be able to be used for fish farming purposes, and the reeds for livestock farming at all. The flow through the left-bank and right-bank collector system is mainly determined by water availability and water supply for irrigation of lands under the jurisdiction of the Suenli and Kizketkent canals.

During the catastrophic low-water period of 2000-2001, collector runoff almost ceased (Figure 1). According to the hydrograph's fluctuations, the water mineralization in the collectors varies - from 1.8 g/l in high-water years to 6 g/l in low-water years, with an average mineralization of 2.2 g/l for the Ustyurt collector and 3.8 g/l for the KKS collector. According to the nature of water supply and the quality of water used, the territory of the Amu Darya River delta can be divided into 3 zones:

1. The left bank is the system of the Lenin Canal, the CLC Collector, the Sudoche Lake, and the Adjibay Bay.

2. The Amudarya is an ocean and inland delta lake fed by the Amu Darya and large irrigation canals.

3. Right-bank zone - the Kyzketken canal system, the KS-1, KS-3, KS-4 collectors on Lake Karateren.

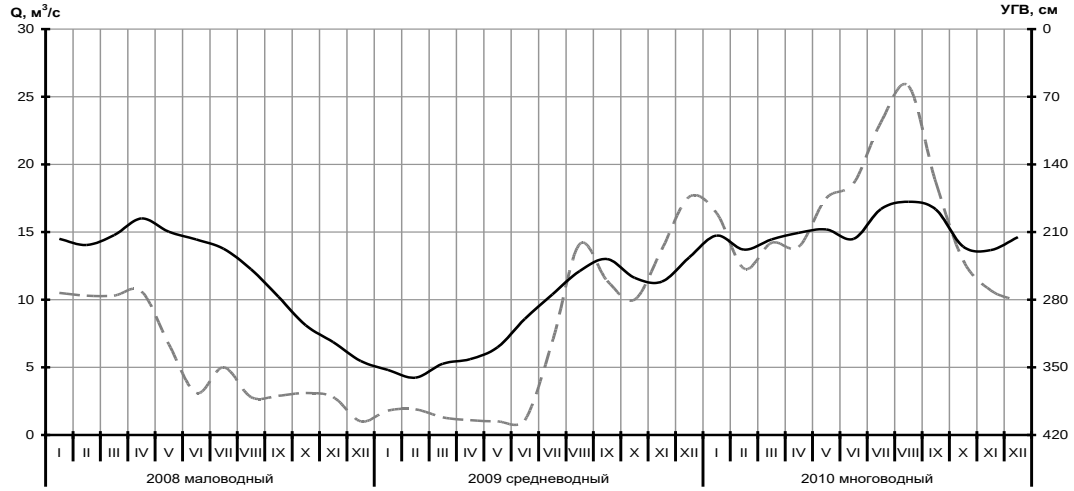


Figure 1. - Schedule of water flow fluctuations in the KS-1 and UGV collector for the characteristic years

According to the nature of water exchange, the water bodies of the Aral Sea region are divided into flowing - the Inter-River Reservoir and Lake Makpalkol, weakly (periodically) flowing lakes Karateren, Bolshoye Sudochye, Begdulla Aydin, Mashankol, Khojakol and Ilmenkol, Bays of Ribachiy, Muynak and Julturbas, and non-flowing collector water accumulators - lakes Akushpa and Tayla. With the decrease or complete cessation of the Amu Darya's natural flow into these bodies of water, their existence became entirely dependent on collector-drainage water (CDW) discharged from irrigated agricultural lands.

CDPs act as an artificial source of nutrition, preventing lakes from drying up completely and preserving their area. This artificial water regime allowed for local stabilization of the hydrological situation. However, the "rescue" waters return from the fields having been chemically transformed. They contain a high concentration of dissolved salts (which contribute to salinization) and a significant amount of agrochemicals (pesticides, fertilizer residues), as well as heavy metals.

Thus, the Sudochye and Julturbas lakes turned into hydrochemical traps. In them, a continuous accumulation of pollutants occurs, which, having no exit, concentrate in water and bottom sediments.

Conclusion

The analysis showed that the irrigation processes ensuring the development of the region's agriculture have a hidden negative effect in the form of a stable accumulation of pollutants in lake ecosystems. The Sudochye and Julturbas lakes function as natural accumulators of salts, biogens, and heavy metals, leading to long-term transformation of their hydrochemical composition and deterioration of the ecological situation. The bioaccumulation of toxic elements in algae, mollusks, and fish poses a high risk for the stability of food chains and biodiversity, increases the likelihood of aquatic ecosystem degradation, and reduces their productive potential. To stabilize the situation, it is necessary to improve the system of monitoring collector-drainage waters, implement technologies for their preliminary treatment, and optimize water use regimes. A comprehensive approach will reduce the anthropogenic load and ensure the preservation of the natural functions of lakes in the South Aral Sea region.

MORPHOBIOLOGY AND ECOLOGY OF THE SPECIES *XYA VARIEGATA* (LATREILLE 1809), DISTRIBUTED IN THE HUMID SANDS OF THE BLACK RIVER IN EASTERN UZBEKISTAN

Begjanov M.K.
Karakalpak State University named after Berdakh

Summary: *This article examines the distribution characteristics, morphology, biology, ecology, feeding habits, population density, and factors affecting the living conditions of the orthopteran insect species Xya variegata, which is found in the moist sandy areas along the Black River in Eastern Uzbekistan.*

Key words: *Insecta, Xya variegata, species, population, entomophage, nature, biotope, biogeocenosis, biology, ecology, forest, water, eremobiont.*

Introduction. Orthopteran insects are adapted to living in various biotopes in nature and are very widespread on Earth. They are considered one of the living components of the biogeocenosis and are of great importance in the food chain and the national economy. Because a number of species of orthopteran insects severely damage agricultural crops and grass in pastures, they are also valuable food for other animals, most invertebrates and vertebrates. Even representatives of the Tettigonidae family are considered beneficial entomophages. However, recent land reclamation, deforestation, drainage of swamps, and disruption of the water regime have led to a reduction in the ecological habitat of many animals, including orthopteran insects [2. 97; 5. 38; 6. 18; 7. 204].

Research materials and methods. Materials for the study of the *Xya variegata* species were collected in the Fergana Valley during the spring, summer, and autumn seasons from 2018 to 2025. During the research, a total of about 1000 populations were collected from the studied area, and its bioecology was studied. Standard entomological methods were used in the collection of materials [1. 67]. The "Saranch of Kazakhstan, Central Asia and adjacent territories" identifier was used to determine the collected insect species [4. 264].

Research results. Based on ecological data recorded in literary (Childebayev, 2013) and scientific (Bekuzin, 1968) sources, we found *Xya variegata* in a damp sandy area on the banks of the Black River at the junction of the Namangan region with the Andijan region (Baliqchi district) (07.07.2018).N40055.097'E 071049.801') Using general entomological methods [1.67], we captured approximately 120-150 individuals of this species through an entomological trap for 1 hour. Population density is very high during the summer season. This species' systematic position is as follows:

Kingdom of Animals
Type - Arthropods
Class - Nasekomas
Group - Orthoptera
Small group - Short-winged Orthoptera
Family - Triperts
Generation - Xya
Species - *Xya variegata* (Latreille 1809)

Biology. On riverbanks, in sandy areas close to water, they undertake a secret life by digging in the sand, creating small holes with the help of their forelegs and jaws. It is very mobile on an open substrate and quickly moves from one place to another in humid areas of sand.

A total of about 100 species are known in tropical and subtropical regions and are very widespread [2. 97; 7. 204]. In appearance, it resembles a small bear. The body is small, somewhat flattened, the head has a flat bump, the crown and forehead are fused, and the mouthparts are extended forward.

A large amount of viscous fluid is secreted from the outer side of the body. Their legs are short. Their front legs are strong, and they dig in the sand with their thick and short claws, deafening their ears. They have claws on all their legs. The thighs of their hind legs are thickened, the lower legs are thinned, and the heels resemble a spear when they are folded. The hind legs, from the lower leg towards the tip of the foot, are tubular in shape, resembling the body of a cyclops (glass-shaped), and they jump smoothly and forcefully through the hind legs. The abdomen of males and females consists of 9-10 tergits [2. 97; 7. 204].

Body color is black, shiny, 4-7 mm long (Picture-1). Males and females are very similar in appearance, but females are slightly larger.

Picture-1. *Xya variegata* (Latreille 1809), original image taken under a microscope.

Xya variegate do not have vocal and auditory organs [3. 308]. Trembling signals have been detected in males on the substrate surface, and they are directly related to each other. No signals were detected in the females.

Males emit signals very close to females in two ways: by striking and rubbing. Vocal kicks of the hind legs along the substrate are observed in males when approaching females. Such signals are transmitted by males to females with a duration of 30-51 seconds, ranging from 3 to 12 beats.

In relation to water, larvae of various sizes train their larvae to swim well. Mating occurs in summer, with adults (imago) and larvae wintering.

Nutrition. A predatory insect that feeds on small insects and earthworms [7. 204].

Ecology. Based on their lifestyle, they can be considered eremobionts (related to the moist soil surface in open areas). This species is under minor threat, even hiding during heavy rainfall. Furthermore, the declining water regime in our region is significantly impacting the habitat and population of this species.

Conclusion. Considering that the Xya *variegata* lives in a humid sandy environment along rivers and lakes, as water resources are dwindling in our Republic today, protecting and preserving the dwindling animal species is of great importance.

INVESTIGATION OF THE PHYSICOCHEMICAL PROPERTIES AND MINERAL COMPOSITION OF KOSON BENTONITE

Sultonov S.[1], Yusupov F.[1], Temirov G.[1], Talipova Kh.[2]
[1]Institute of General and Inorganic Chemistry of the Academy of Sciences of Uzbekistan. 77A, Mirzo Ulugbek Street, Tashkent 100170, Uzbekistan
[2]Tashkent institute of chemical technology, Navoi Street, 32, Tashkent, Uzbekistan

Summary: *This study investigates the physicochemical and mineralogical properties of bentonite from the Koson deposit using XRF, XRD, and FTIR analytical techniques. The XRF results indicate that the sample is dominated by SiO_2 (54.88%) and Al_2O_3 (14.71%), confirming its aluminosilicate nature, while minor oxides such as Fe_2O_3, MgO, CaO, Na_2O, and K_2O reflect the presence of accessory minerals and exchangeable cations. The XRD analysis reveals that montmorillonite is the primary crystalline phase, accompanied by quartz, illite, and small amounts of other silicate and carbonate minerals. FTIR spectroscopy further supports these findings by identifying characteristic absorption bands corresponding to structural –OH groups, interlayer water, and Si–O and Al–O vibrations, all typical of smectite-type clays. Overall, the results demonstrate that Koson bentonite is a montmorillonite-rich natural clay with favorable structural and chemical characteristics, making it a promising material for applications in adsorption, drilling fluids, environmental remediation, and other industrial processes.*

Key words: *Koson bentonite, montmorillonite, XRF, XRD, FTIR, physicochemical properties, mineral composition.*

Introduction

Bentonite is one of the most widely used natural clay minerals due to its unique physicochemical properties, high adsorption capacity, large specific surface area, swelling ability, and ion-exchange characteristics [1]. These properties make bentonite an essential raw material in various industrial sectors, including drilling fluids, metallurgy, environmental protection, wastewater treatment, construction, agriculture, pharmaceuticals, cosmetics, and polymer composite production [2]. The dominant component of bentonite is montmorillonite, a layered aluminosilicate mineral that determines its reactivity and technological performance [3].

In recent years, global demand for high-quality bentonite has significantly increased, driven by the rapid development of oil–gas extraction technologies, the expansion of environmental purification systems, and the need for effective sorbents and catalysts [4]. As a result, scientific evaluation of local bentonite deposits has become crucial to ensure resource sustainability, optimize industrial processing, and develop cost-effective materials with improved functional characteristics [5,6].

The Koson deposit, located in the Kashkadarya region of Uzbekistan, is known for its rich reserves of natural clays [7]. Preliminary geological surveys show that Koson bentonite possesses valuable mineralogical components and promising adsorption behavior. However, comprehensive physicochemical studies of this local resource remain limited [8]. Detailed investigation of its composition, structural features, and functional properties is therefore essential for determining its suitability for industrial applications and for developing potential modification methods to enhance performance [9].

A systematic evaluation of the physicochemical and mineralogical characteristics of Koson bentonite will not only provide important scientific insights into its structure and properties but also contribute to the development of new technologies for its rational utilization [10]. Such studies enable the assessment of the quality of raw materials, identification of impurities, determination of active functional groups, and prediction of bentonite behavior under various technological conditions [11].

Therefore, the present research aims to carry out an in-depth investigation of the physicochemical properties and mineral composition of bentonite from the Koson deposit [12]. This includes the analysis of its structural, thermal, mineralogical, and adsorption characteristics using modern instrumental methods [13]. The findings of this work are expected to expand the scientific understanding of regional clay resources and support their effective application in industrial and environmental technologies [14,15].

Materials and Methods

Sample Collection and Preparation

Bentonite samples were collected from the Koson deposit located in the Kashkadarya region (Uzbekistan). Representative bulk samples were taken from the upper and middle layers of the clay formation to ensure the reliability of analytical results. Prior to instrumental analysis, the raw bentonite samples were subjected to preliminary purification by removing visible impurities, plant residues, and coarse particles.

The prepared samples were then oven-dried at 120 °C for 4 hours to remove physically adsorbed moisture and ensure thermal stabilization of the mineral components. The dried samples were crushed using an agate mortar and sieved through a 75 μm mesh to obtain a homogeneous powdered material suitable for XRF, XRD, and FTIR examinations.

X-Ray Fluorescence (XRF) Analysis

Chemical composition of the Koson bentonite was investigated by X-ray fluorescence spectroscopy. XRF analysis was performed using an energy-dispersive XRF spectrometer, calibrated with certified reference materials to ensure analytical accuracy. The powdered bentonite samples were pressed into pellets under high pressure and analyzed for their major oxides (SiO_2, Al_2O_3, Fe_2O_3, MgO, CaO, K_2O, Na_2O) and trace elements. The obtained results allowed the determination of the elemental distribution and purity of the samples, enabling assessment of their suitability for industrial applications.

X-Ray Diffraction (XRD) Analysis

The mineralogical composition and crystalline phases were determined using X-ray diffraction (XRD). Measurements were conducted on an XRD diffractometer equipped with CuKα radiation (λ = 1.5406 Å) operating at 40 kV and 30 mA. Scans were recorded in the 2θ range of 5°–70°, with a step size of 0.02° and a scanning speed of 2°/min.

The diffractograms were processed using standard reference data from the ICDD (International Centre for Diffraction Data) database. The XRD analysis enabled identification of montmorillonite as the dominant mineral phase, along with accompanying minerals such as quartz, illite, calcite, and feldspar.

Fourier Transform Infrared Spectroscopy (FTIR)

The functional groups and structural features of the bentonite samples were analyzed by Fourier transform infrared spectroscopy (FTIR). Spectra were recorded in the range of 4000–400 cm^{-1} using the ATR (attenuated total reflection) method. Approximately 5–10 mg of the dried powder was placed on the diamond/ZnSe crystal, and spectra were obtained at a resolution of 4 cm^{-1} with 32 scans per sample.

Results and Discussion

A comprehensive analysis was conducted to determine the physicochemical and mineralogical characteristics of bentonite samples collected from the Koson deposit. The obtained results provide important insights into the elemental composition, crystalline structure, and functional groups of the examined material, allowing an evaluation of its quality and potential industrial applications. This section presents the outcomes of X-ray fluorescence (XRF), X-ray diffraction (XRD), and Fourier transform infrared (FTIR) analyses performed on oven-dried bentonite samples.

The chemical composition of Koson bentonite was first evaluated using XRF spectroscopy in order to identify the major oxides and trace elements present in the sample. As shown in Figure 1, the XRF results demonstrate that the bentonite is predominantly composed of silica (SiO_2) and alumina (Al_2O_3), confirming the montmorillonitic nature of the clay. In addition, the presence of Fe_2O_3, MgO,

CaO, K_2O, and Na_2O indicates the existence of accessory minerals and exchangeable cations that play a significant role in determining the adsorption, swelling, and ion-exchange properties of the material.

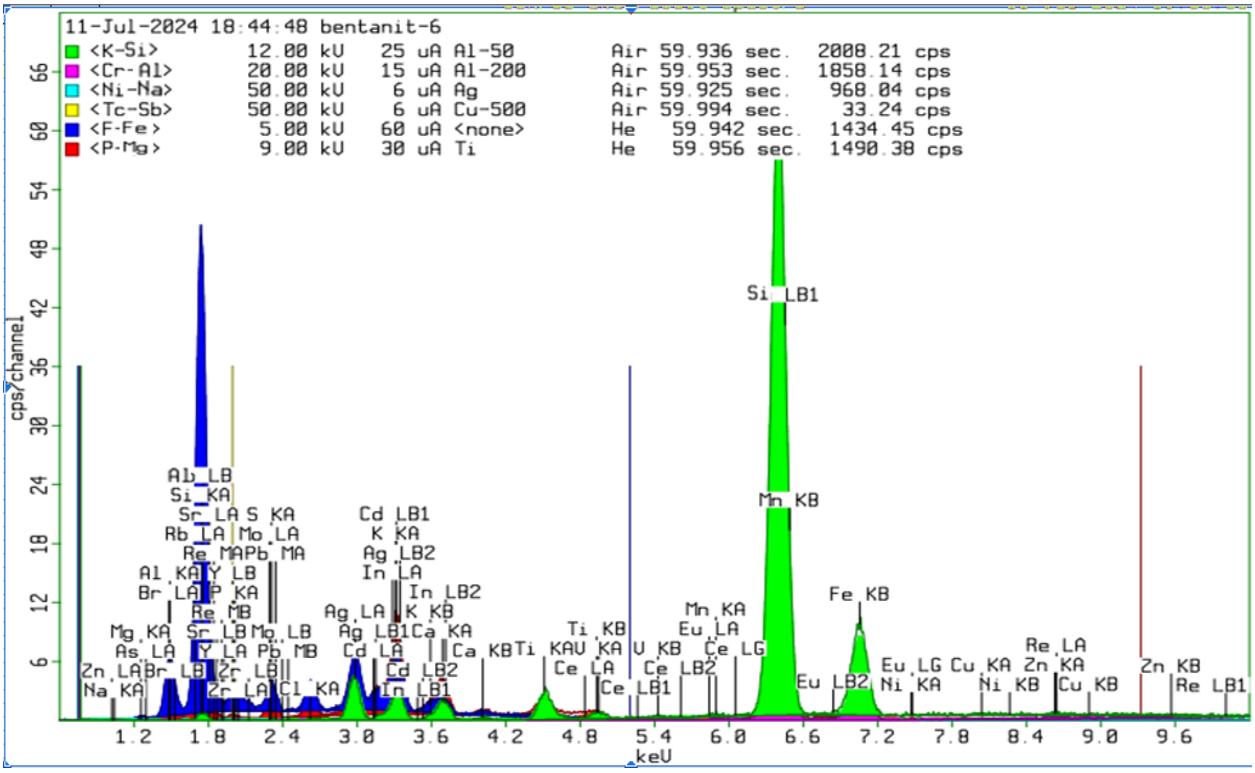

Figure 1. XRF spectrum indicating the elemental oxide composition of Koson bentonite

The XRF spectrum presented in Figure 1 illustrates the elemental composition of the Koson bentonite sample. The most intense peaks correspond to silicon (Si), confirming the silica-rich nature of the clay and indicating a high SiO_2 content typical of montmorillonitic materials. Prominent aluminum peaks (Al_Kα and Al_LB) further support the presence of an Al_2O_3–SiO_2 structural framework characteristic of montmorillonite. A noticeable peak for iron (Fe_Kβ) indicates the presence of Fe_2O_3, which may originate from iron-bearing impurities or octahedral substitutions within the clay structure. Additional peaks corresponding to Mg, Ca, Na, and K reveal the presence of MgO, CaO, Na_2O, and K_2O, reflecting a variety of exchangeable cations that influence the swelling capacity and adsorption properties of the bentonite. Low-intensity peaks of trace elements such as Sr, Ti, Zn, Mn, Cu, Ag, and Re are also detected, which is typical for naturally occurring bentonite deposits shaped by complex geological processes. Overall, the XRF results confirm that the Koson bentonite is a montmorillonite-rich aluminosilicate containing minor amounts of quartz, illite, and calcite as accessory phases.

The mineralogical composition of the Koson bentonite was examined using X-ray diffraction (XRD), and the corresponding diffraction pattern is presented in Figure 2. The XRD results clearly indicate that montmorillonite is the dominant crystalline phase in the sample, as evidenced by the characteristic basal reflection typically observed at low 2θ angles. In addition to the main smectite peak, the diffractogram also displays secondary reflections associated with accessory minerals such as quartz, illite, and calcite, which commonly occur in natural bentonite deposits. The presence of these phases suggests a mixed mineralogical structure influenced by sedimentary and diagenetic processes during the formation of the Koson clay. Overall, the XRD pattern in Figure 2 confirms that the sample is predominantly montmorillonitic with minor contributions from accompanying silicate and carbonate minerals.

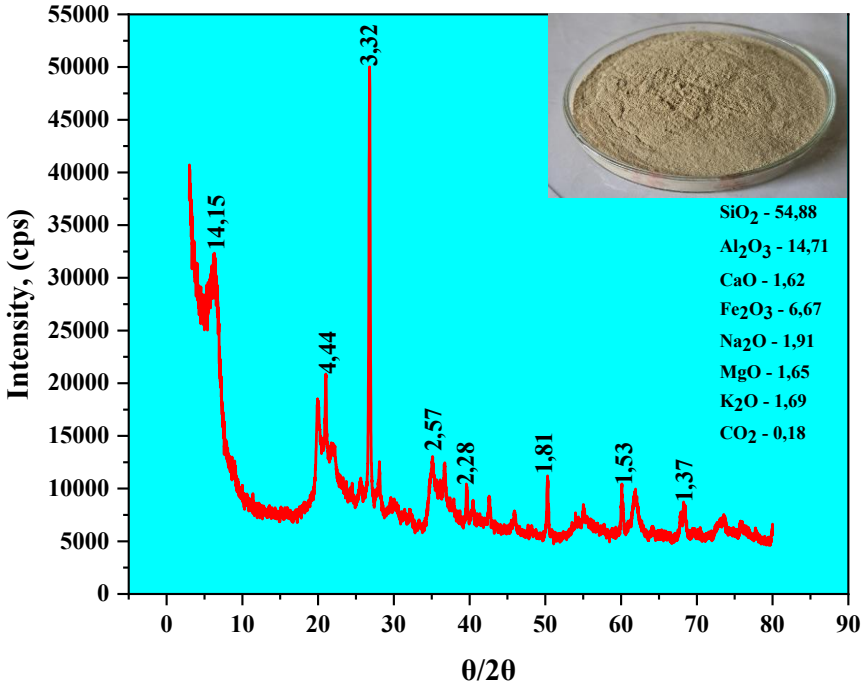

Figure 2. XRD diffraction pattern showing the crystalline phases of Koson bentonite

The XRD pattern presented in Figure 2 provides a clear representation of the crystalline phases present in the Koson bentonite sample. The diffractogram is dominated by a strong peak at approximately 3.32 Å, which is characteristic of quartz (SiO_2). The high intensity of this reflection indicates that quartz is present in significant amounts within the bentonite matrix. This observation is consistent with the elemental composition obtained from XRF analysis, which shows that SiO_2 accounts for 54.88% of the sample, confirming that quartz is one of the major components.

Another set of peaks appears around 14.15 Å and 4.44 Å, which are indicative of montmorillonite, the principal clay mineral in bentonite. The basal reflection near 14 Å corresponds to the (001) plane of smectite minerals, while the secondary smectite peaks at ~4.44 Å confirm the layered aluminosilicate structure. The presence of these reflections indicates that the sample contains a significant amount of montmorillonite, which contributes to swelling, adsorption, and cation-exchange properties.

Additional peaks observed at 2.57 Å, 2.28 Å, 1.81 Å, 1.53 Å, and 1.37 Å correspond to minor crystalline phases such as illite, feldspar, and possible traces of calcite. These accessory minerals commonly occur in bentonite deposits and reflect the geological processes involved in clay formation. Their presence is also supported by the XRF results, where oxides such as Al_2O_3 (14.71%), Fe_2O_3 (6.67%), Na_2O (1.91%), MgO (1.65%), and K_2O (1.69%) were detected.

The mineralogical profile obtained from the XRD pattern demonstrates that Koson bentonite is a montmorillonite-rich aluminosilicate clay with a substantial quartz content and smaller amounts of illite and other accessory minerals. The combination of montmorillonite and quartz suggests that the bentonite has both high adsorption potential and good mechanical stability, making it suitable for industrial applications such as drilling fluids, sorption processes, and environmental remediation.

The structural features and functional groups of the Koson bentonite sample were examined using FTIR spectroscopy, and the corresponding spectrum is presented in Figure 3

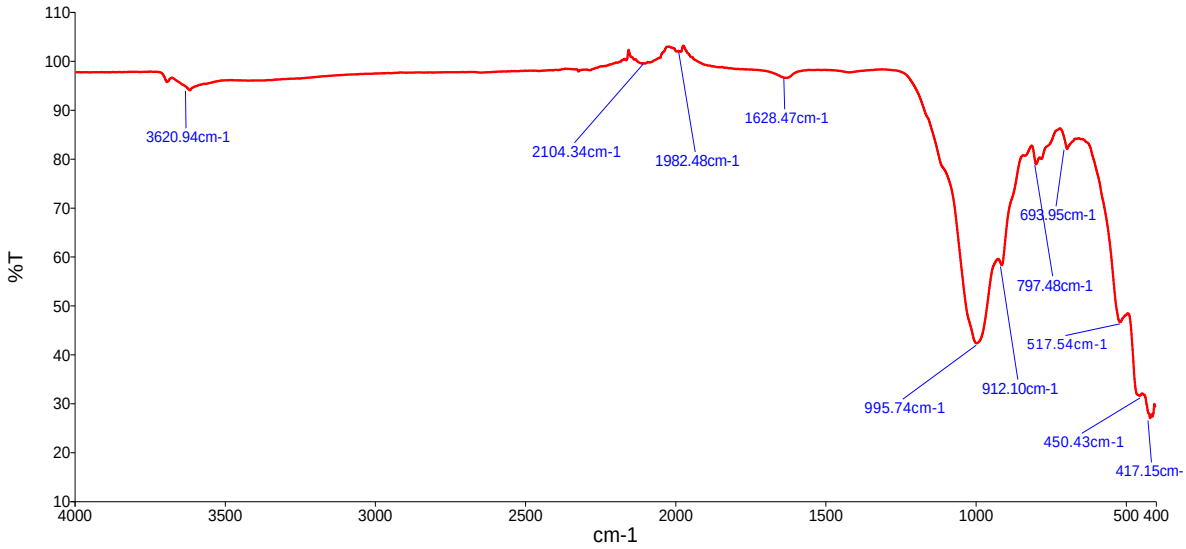

Figure 3. FTIR spectrum showing the characteristic functional groups of Koson bentonite

The FTIR spectrum displayed in Figure 3 provides detailed information about the functional groups and structural features of the Koson bentonite sample. The spectrum shows several characteristic absorption bands typically associated with montmorillonite-type aluminosilicate clays.

A broad absorption band observed around 3620.94 cm^{-1} corresponds to the stretching vibrations of structural hydroxyl groups (–OH) located within the octahedral sheets of montmorillonite. This peak indicates the presence of inner-surface and inner-hydroxyl groups, which are important for the clay's hydration and cation-exchange properties.

The weak bands appearing at 2104.34 cm^{-1} and 1982.48 cm^{-1} are associated with combination or overtone vibrations of the Si–O and Al–O lattice modes. These features are typical for layered silicate structures and confirm the integrity of the montmorillonite framework.

A clear absorption peak at 1638.43 cm^{-1} corresponds to the bending vibration of adsorbed water (H–O–H). This confirms the presence of interlayer water molecules, which play a critical role in the swelling and hydration behavior of bentonite.

The strong and broad region around 995.74 cm^{-1} is attributed to the Si–O stretching vibration, which is the main fingerprint region for phyllosilicates. This peak signifies the dominance of tetrahedral silica sheets within the clay.

Two additional bands at 912.10 cm^{-1} and 797.48 cm^{-1} correspond to Al–Al–OH and Si–O–Al bending vibrations, respectively. These peaks are characteristic of montmorillonite and indicate the presence of both aluminum-rich octahedral layers and tetrahedral substitutions.

In the lower wavenumber region, several peaks such as 695.96 cm^{-1}, 517.54 cm^{-1}, 450.43 cm^{-1}, and 417.15 cm^{-1} appear. These bands correspond to Si–O–Mg, Si–O deformation, and O–Si–O bending vibrations. Such modes are typical of smectite-type minerals and support the classification of the sample as a montmorillonitic clay.

Overall, the FTIR spectrum in Figure 3 confirms that the Koson bentonite possesses a classical montmorillonite structure characterized by Si–O and Al–O lattice vibrations, structural hydroxyl groups, and interlayer water molecules. The results are consistent with the XRD and XRF analyses, collectively indicating that the sample is predominantly a montmorillonite-rich aluminosilicate containing quartz and minor accessory minerals.

Conclusion

In this study, the physicochemical and mineralogical properties of bentonite obtained from the Koson deposit were comprehensively investigated using XRF, XRD, and FTIR analyses. The XRF results revealed that the sample is rich in SiO_2 and Al_2O_3, with smaller amounts of Fe_2O_3, MgO, CaO, Na_2O, and K_2O, confirming the aluminosilicate nature of the clay and indicating a predominantly montmorillonitic composition. The XRD diffractogram further supported these

findings by displaying characteristic reflections of montmorillonite along with quartz, illite, and minor accessory minerals. The presence of a strong basal peak near 14 Å highlighted the layered structure typical of smectite clays.

The FTIR spectrum exhibited distinct absorption bands corresponding to structural hydroxyl groups, interlayer water molecules, and Si–O and Al–O vibrations, providing additional evidence for the dominance of montmorillonite in the sample. The combination of these instrumental analyses confirms that Koson bentonite is a high-quality, montmorillonite-rich aluminosilicate clay with favorable structural and chemical characteristics.

Overall, the findings demonstrate that bentonite from the Koson deposit possesses significant industrial potential due to its mineralogical purity, functional group composition, and physicochemical properties. These characteristics make it suitable for applications in adsorption processes, drilling fluids, environmental remediation, construction materials, and other technological fields requiring high-performance clays.

Rezyume: *Ushbu tadqiqotda Koson konidan olingan bentonit namunalarining fizik-kimyoviy va mineral tarkibi XRF, XRD va FTIR analitik usullari yordamida o‘rganildi. XRF natijalari namunada SiO_2 (54,88%) va Al_2O_3 (14,71%) miqdori yuqori ekanini ko‘rsatib, uning alyumosilikat tabiatini tasdiqladi. Shuningdek, Fe_2O_3, MgO, CaO, Na_2O va K_2O kabi ikkilamchi oksidlarning mavjudligi bentonit tarkibida qo‘shimcha minerallar va almashinuvchan kationlar borligini bildiradi. XRD tahlili asosiy kristall faza sifatida montmorillonitni aniqladi, kvart s, illit va boshqa silikat hamda karbonat minerallar esa aralash fazalar sifatida qayd etildi. FTIR spektrlari ushbu xulosalarni qo‘llab-quvvatlab, strukturaviy –OH guruhlari, qatlamlararo suv hamda Si–O va Al–O bog‘lanishlariga xos yutilish chiziqlarini namoyon etdi. Umuman olganda, natijalar Koson bentoniti montmorillonitga boy, qulay strukturaviy va kimyoviy xususiyatlarga ega tabiiy gil ekanligini*

ko‘rsatadi. Bu esa uni adsorbsiya jarayonlari, burg‘ulash eritmalari, ekologik remediatsiya va boshqa sanoat sohalarida qo‘llash uchun istiqbolli materialga aylantiradi.

Резюме: *В данной работе исследованы физико-химические и минералогические свойства бентонита из Косонского месторождения с использованием аналитических методов XRF, XRD и FTIR. Результаты рентгенофлуоресцентного анализа показали, что образец содержит высокие количества SiO_2 (54,88%) и Al_2O_3 (14,71%), что подтверждает его алюмосиликатную природу, а также меньшие количества Fe_2O_3, MgO, CaO, Na_2O и K_2O, указывающие на присутствие сопутствующих минералов и обменных катионов. Согласно данным рентгеноструктурного анализа, основную кристаллическую фазу составляет монтмориллонит, в то время как кварц, иллит и небольшие количества других силикатных и карбонатных минералов присутствуют в качестве примесей. Спектры FTIR дополнительно подтверждают эти результаты, демонстрируя характерные полосы поглощения, соответствующие структурным –OH группам, межслойной воде, а также колебаниям связей Si–O и Al–O, типичным для смектитовых глин. В целом установлено, что бентонит из Косонского месторождения является монтмориллонитсодержащей природной глиной с благоприятными структурными и химическими характеристиками, что делает его перспективным материалом для применения в адсорбции, буровых растворах, экологической ремедиации и других промышленных процессах.*

ANALYSIS OF RESEARCH ON SOIL ALGAL FLORA

Tursunova Sh.A.
Kokand State University

Summary: *This brochure presents an analysis of research conducted on soil algal flora and the methodology for research on soil algal flora.*

Key words*: algology, algoflora, fundamental, transformed soils, species, soil systematics*

To date, a number of works have been carried out on the study of soil algal flora in various regions of the Earth. The participation of algae in the processes occurring in the soil is very important. Accordingly, algae also play an important role in the process of soil formation. Research on soil algal flora can be divided into two stages according to the purpose of the study.

1. Classical-fundamental research.
2. Research on soils transformed by the influence of ecological factors.

Below is an analysis of the work carried out on soil algal flora, their composition, distribution and taxonomy of soil algae.

1. Classical-fundamental research was first initiated by B.A. Keller (1926) with the study of the taxonomic composition of algae distributed in the desert and steppe regions of Central Asia, especially in Uzbekistan. He reported that the species *Nostoc commune*, belonging to the class Hormogoniophyceae, family Nostocacea, distributed on the surface of the soil, is a component of the flora of deserts and steppes. The shell of algae protects the soil, which is explained by the lack of turbidity in the water [1].

The algal flora of barren soils distributed in our republic was first identified by N.N. Bolishev and T.N. Evdokinova, based on the fact that the coatings on the surface of barren soils are formed by taxa belonging to the order Oscillatoriales of the Cyanophyta department. The study of the role of algae in the formation of structure in the soil has aroused great interest in laboratory experiments. K.V. Marathe studied the effect of species (*Symploca muralis*, *Chlorogloea fritchii*, *Hapalosiphon welwitschii*) on the state of soil aggregation [2]. The aggregate effect was 35.7-78.1%. Other researchers have shown the important structural role of the species *Chlorella pyrenoidosa*, *Nostoc commune*, *Oscillatoria prolifica*. One of the first major studies on the systematics and ecology of soil algae was carried out by Blaine Metting (1981). The scientist conducted the first and most extensive study, which was published in the article "Systematics and Ecology of Soil Algae". Soil algae are found in almost all terrestrial environments on Earth and are always found both on and below the soil surface. The soil algal flora includes representatives of the Cyanochloronta, Chlorophycophyta, Euglenophycophyta, Chrysophycophyta, and Rhodophycophyta. 38 orders of prokaryotes and 147 orders of eukaryotes include terrestrial species, most of which are edaphic.

Algae play a major role in soil formation. In this, mainly microscopic organisms produce a large amount of organic matter. In addition to the direct effect of algae on the erosion process, an indirect effect has also been identified - that is, the indirect effect strengthens biological fertilizers in the fields from being washed away. Small unicellular algae retain soil particles by secreting mucus. *Synechococcus quarderi* was found to be the first to occur on sandy substrates, forming a crust and reducing erosion. This process, in turn, contributes to better water infiltration, better settlement of algae, bacteria, fungi and plant seeds in the soil.

G.I. Markova (1976; 1977) noted the occurrence of filamentous blue-green algae on eroded slopes without flow [3].

L.I. Domracheva et al. showed that the development of green and blue-green algae leads to soil “blooming”, in which the total biomass of microorganisms accounts for 70-90% of the biomass formed by algae.

As autotrophic organisms, algae synthesize additional amounts of organic matter that participate in many biological processes in the soil. Algae are permanent components, form soil micropopulations, play an important role in soil self-purification processes and are used as bioindicators of its condition.

Soil algae have been found to play a specific role in soil transformation. Blue-green algae form a complex community with bacteria. V.P. But studied the algal flora of the Western Pamirs, Bazova studied the algal flora of the Eastern Pamirs, G.A. Bazova studied the algal flora of the southern gray soils of Tajikistan. The flora of algae distributed in the arable lands of Uzbekistan, in particular, the Tashkent region, was studied by K.Yu. Musayev. His monographic work on the algal flora of arable lands on gray soils is considered a practical program for research, in which the taxonomic composition of the algal flora is substantiated by the irrigation system.

K.Yu. Musayev's scientific research is devoted to gray soil and Mirzachul in the Samarkand region. In the first work, detailed information was provided on the taxonomic composition of algae identified from light gray soil, typical gray soil and dark gray soil, their distribution in relation to ecological factors. As a result, 97 taxa were identified, and according to their systematic composition, taxa belonging to the Cyanophyta department were numerically dominant. The second work was of an ecological nature, and data were presented on the fact that the distribution of algae, depending on soil salinity, causes changes in the composition of dominant species. It was noted that the number of species in the soil is greater than in the spring and autumn seasons. The taxonomic composition of the algal flora distributed in the newly developed and irrigated lands of Mirzachul soils for many years was studied by K.Yu. Musayev. Algae taxa are distributed in the soils of the cultivated areas of the Karakul district of the Bukhara region [4].

K.Yu. Musayev, V.P. But (1966) devoted their work to the study of the patterns of distribution of algae species along steep slopes. In dark gray soils at an altitude of 1300 m above sea level, filamentous taxa from the family *Oscillatoriceae* of the Cyanophyta department stand out from others in the large number of species. In the soils of the mountainous regions at altitudes of 2000 m and above, it was noted that taxa of the order Nostocales, which are heterocysts and can absorb molecular nitrogen from the soil atmosphere, and taxa belonging to the Xanthophyta division are widespread. When studying the composition of algae taxa distributed in the soils of the mountainous region, differences in the composition of taxa on different slopes were revealed. It was found that the number of algae taxa on the humid northern slopes was higher than in the drier southern areas. [5].

When analyzing the systematic composition of algae taxa in the Uzbek part of the southwestern Tien Shan range, it was found that taxa belonging to the Cyanophyta department in the gray soils in the areas from 230 m to 500 m altitude were dominated by taxa belonging to the order of Oscillatoriales with a fibrous structure and heterocysts, including *Phormidium, Oscillatoria, Borzia*. In the soils of the mountain region between 1300-2000 m altitude, it was noted that the species of the Chlorophyta, Xanthopyta and partially Cyanophyta departments were dominant. In the pasture soils of the mountain at an altitude of 2500 m and above, the occurrence of algae belonging to the Cyanophyta department decreased, and algae of the Chlorophyta and Xanthopyta departments were widespread. As a result of research conducted in collaboration with K.Yu. Musayev and U.N. Toshmukhammedov, it was found that species of the Chlorococcales and Cyanophyta divisions of the Chlorophyta division are more common in uncultivated soils. In cotton fields with a long period of cultivation, it was found that species of the Cyanophyta divisions are more diverse.

K.Yu. Musayev and Sh.U. Umarova (1967) noted that the biological diversity of algal flora in cotton-planted soils consists of 212 species. Sh.J. Tojiboyev identified 67 species of algae from the rhizosphere of 67 species of grasses belonging to 14 families: 23 blue-green, 27 green, 7 diatom, 7 yellow-green, and 3 euglena species. 41 taxa were recorded from the rhizosphere of plants of the Asteraceae family, 37 from Cucurbitaceae, and 35 from Ascomycota. 21-27 taxa were identified in the root rhizospheres of representatives of the Tomato, Solanaceae, and Labiatae families, and a total of 7-14 taxa were recorded from the root rhizospheres of representatives of the Solanaceae and Solanaceae families. Among the identified algae, filamentous structures were most common. It was argued that the distribution of algae in the rhizosphere is also influenced by the vegetation period of

plants. In 1973, Sh.J. Tojiboev studied the taxonomic composition of algae in undeveloped gray soils of the Tashkent region and their comparative analysis. [6].

L.N.Bolishev, T.N.Evdokimova (1969) studied the systematic composition of the algal flora of the South-Western Kyzylkum. [2].

The works of Y.K.Troiskaya (1961) are devoted to the taxonomic study of the flora of algae distributed in the soils of the southern part of Kyzylkum in Uzbekistan. 224 species and varieties were identified from the soils of the region, and 126 species (56.25%) were recorded as belonging to the Cyanophyta department. It was noted that in this department the number of species belonging to the *Oscillatoriaceae, Schizothrichaceae* families is greater than others.

M.P.Masharipov, M.A. Kochkarova, Z.A. Ormonov in 1998 identified 78 species and forms of blue-green algae in cotton, wheat, alfalfa and undeveloped gray lands. Of these, 19 species were considered nitrogen-fixing algae. 48 species of algae were identified from cotton fields, and 34 species from the order Oscillatoriales were identified in wheat soils. 32 species of algae were identified from gray soils, and among them, representatives of *Chroococcales* and *Nostocales* were reported to have the most species. [7].

Species of the yellow-green algae department are widespread in various soil types. This is especially true for soils of the humid region. According to L.A. Gaysina, L.Kh. Abuzarova, G.R. Bakieva, L.S. Khaybullina, the number of species of yellow-green algae is much higher than the number of other algoflora. In Kashkadarya soils, L.M. Safiullina also found that these algae departments are found in barren soils. According to Neustupa, Skaloud, algae belonging to the Bacillariophyta department have developed a high level of resistance to the effects of various toxic substances. [8].

The species of the yellow-green algae department were studied by R.R. Kabirov, and according to his data, it was found that soils are the most "sensitive" to various pollutants. E.A. Shtina noted that the cells of yellow-green algae determine the "purity and fertility" of soils. Cells of Bacillariophyta algae, due to their rapid reproduction, quickly occupy new habitats. N.V. Sukhanova and her co-authors, studying the taxonomic composition of soil algae distributed in the humid zone of the cities of Ufa, Sibaya and Beloretsk and their forests, determined the high biodiversity of diatom algae (39 species) and noted the high abundance of species of the *Naviculaceae* and *Pinnularia* genera from the *Naviculaceae* family.

THE EFFECT OF COMPONENTS ON THE PHYSICAL, CHEMICAL AND BIOLOGICAL PROPERTIES OF MORDANT SOLUTIONS

Orazbaeva A.A.
Nukus Technical University

Summary: *This paper investigates the influence of various chemical components – urotropin ($C_6H_{12}N_4$), monoetanolamine ($NH_2C_2H_4OH$) and copper acetate monohydrate ($(CH_3COO)_2Cu\ 5H_2O$) – on the physicochemical properties of aqueous solutions used as seed dressings. The main focus is on changes in solution parameters such as pH, viscosity and density, depending on the concentration of the components. The results show that these compounds have significant potential to increase the effectiveness of seed dressings by improving their physical and chemical characteristics. The study proposes new combinations of these substances that can increase plant resistance to pathogens and pests, providing long-term protection.*

Key words: *Seed dressings, urotropin, monoetanolamine and copper acetate monohydrate, physicochemical properties, solition pH, viscosity, density, fungicidal activity.*

Introduction. Seed dressings play an important role in agriculture, protecting plants from various pathogens and pests. The problem of developing effective seed dressings is becoming increasingly relevant in the context of increasing environmental preparations. This study aims to investigate the effect of various chemical components, such as urotropin, monoetanolamine, and copper acetate monohydrate, on the physicochemical properties of solutions used as seed dressings.

Synthesis: To study the effect of various on the properties of seed dressings, aqueous solutions with different concentrations of urotropin, monoethanolamine and copper acetate monohydrate were prepared. Measirements of pH, viscosity, density and refractive index were carried out using standart analytical methods. Isomolar series, spectrophotometric analysis and X-ray phase analysis were used to determine the physical and chemical properties of the solutions under study.

Characterization: Urotropin has antiseptic, stabilizes the pH of solutions and prevents the development of fungal and bacterial infections. Studies have shown that as the concentration of hexamethylenetetramine increases, the pH first decreases and then increases, which is associated with the buffering effect of this compound. Monoethanolamine improves the adhesive properties of solutions, improving the coating if seeds with active components. The study confirmed that aminoethanol also contributes to the formation of more stable solutions, which increases the effectiveness of seed dressings.

Copper acetate monohydrate exhibits high fungicidal activity, effectively suppressing the growth of fungal pathogens. It increases the viscosity and density of solutions, which improves their adhesive properties and ensures uniform seed coating. The results show that copper compounds can significantly increase the effectiveness of seed dressings due to their long-lasting antimicrobial action and stability in the environment.

Change in pH of solutions: Studies have shown that an increase in the concentration of hexamethylenetetramine first lowers the pH, then stabilizes it, which is associated with the buffering effect of this compound. Similar results were obtained for monoethanolamine.

Viscosity: The viscosity of the solutions increased with increasing concentrations of all components. This indicates an increase in intermolecular interactions, which contributes to a more uniform coating of the seeds.

Density and refractive index: An increase in the solutions, which improves their adhesive properties.

Table 1. Chage in pH and viscosity of solutions depending on the concentration of componends

Concentrion (mol/l)	Urotropin (pH)	MEA (pH)	MAM (pH)	Viscosity (urotropin, mPa s)	Viscosity (MEA, mPa s)	Viscosity (MAM, mPa s)
0,1	7,0	7,2	6,8	1,1	1,2	1,3
0,2	6,5	6,9	6,4	1,3	1,4	1,6
0,3	6,0	6,5	6,0	1,5	1,7	1,9
0,4	5,8	6,2	5,7	1,8	2,0	2,3
0,5	5,5	6,0	5,5	2,0	2,2	2,6

Discussion. The results of the study indicate the importance of selecting and combining fungicide components to achieve maximum effectiveness. Urotropin and monoethanolamine stabilize pH and improve adhesion, which is necessary to increase the resistance of preparations to external influences. Copper acetate monohydrate demonstrates high efficacy as a fungicide, helping to suppress pathogens in the early stages of plant growth. These components can be used in various combinations to create new seed treatment formulations with improved properties.

Conclusion. The study confirms that urotropin, monoethanolamine and copper acetate monohydrate have significant potential for use as components of seed dressings. These substances improve the physicochemical properties of solutions, which contributes to their more effective use in protecting plants from pathogens and pests. Determining the optimal combinations and concentrations of these components will allow the creation of new, more effective and safer seed dressings.

Summary: *The article presents the results of studying the processes of obtaining granulated phosphorus-humus fertilizers by decomposing phosphorus-containing raw materials with sulfuric acid with a concentration of 92% at a stechometric norm of 10-50% to form monocalcium phosphate and oxidizing licorice meal with hydrogen peroxide in the presence of acetic acid (in a mass ratio: to the organic part of the raw material: H_2O_2: CH_3COOH = 100: 10: 1) by adding the mass of oxidized licorice meal to the acid superphosphate mass, as well as determining the optimal conditions for obtaining phosphorus-humus fertilizers.*

Key words: *meal, hydrogen peroxide, phosphorite, extractive substances, sulfuric acid, oxidation,humic acids, phosphorus, nitrogen, calcium, sulfur.*

Introduction. World experience in the sustainable development of agriculture and agrochemical tests have shown that the application of organic and organomineral fertilizers is the main factor in preserving soil fertility, increasing the beneficial effects of mineral fertilizers, and obtaining high and quality yields of agricultural crops. Therefore, obtaining and applying organic and organomineral fertilizers based on organic plant resources, phosphate raw materials, and agricultural ores containing all the nutrients necessary for the normal growth and development of plants is a criterion for increasing agricultural productivity. In this regard, the development and implementation of a technology for obtaining organic and organomineral fertilizers based on plant-based organic resources, phosphate raw materials, and agricultural ores is of great importance.

In global agricultural practice, soil fertility is typically assessed based on three main types of indicators: agrophysical, biological, and agrochemical. These soil fertility indicators are closely interrelated. Agrophysical indicators of soil fertility include structure, fractional and mineralogical composition, porosity, air and moisture capacity, and water permeability. The agrophysical indicators of soil usually remain stable for long periods, and when they do change, restoration is extremely difficult. The agrochemical indicators of soil fertility include the content of nitrogen, phosphorus, potassium, and other macro- and microelements, as well as their availability to plants. These agrochemical indicators determine the supply of essential nutrients for plant growth and development. The biological indicator of soil fertility is determined by the quantity, composition, and properties of organic matter, as well as its biological activity and phytosanitary condition. It should be noted that in most cases, the primary indicator of soil fertility is the amount of organic matter and its qualitative state. This is because organic substances have the strongest influence on the most crucial soil properties: agrophysical, biological, and agrochemical states. The reserves of organic or humic substances in the soil are the main indicator of soil fertility. Soil organic matter accumulates carbon, nitrogen, potassium, phosphorus, and other macro- and microelements, ensures the formation of optimal conditions for plant development in the soil, and mitigates the effects of toxic substances [1].

Plant residues in soil undergo humification and mineralization under the influence of microflora, simultaneously releasing nutrients. The increase in humus content in the upper soil horizon is related to the nature of input, distribution, and decomposition of plant residues. The role of crops in humus accumulation in soils is determined by their yield and crop rotation structure. The annual approximate replenishment of soil carbon after plant residue humification ranges from 0.71 to 1.34 t/ha. Plant residues contain a large amount of nutrients available to cultivated plants. The

quantity of nitrogen, phosphorus, and potassium entering the soil depends on the type of crop rotation, crop yield, and the level of mineral and organic fertilizer application. Plant residues contribute 27.2-49.0 kg/ha of nitrogen, 13.6-24.5 kg/ha of phosphorus, and 27.2-49.0 kg/ha of potassium to the soil. On average, 90.9 kg/ha of nitrogen, phosphorus, and potassium combined are returned to the soil with agricultural crop residues [2].

In the work [3], it was shown that the application of organomineral fertilizers was positive both for the total weight of the bunch and for the elements of the crop structure. The highest grain, straw, and bunch yields were obtained in the variant with a manure-lignin mixture at a rate of 60 t/ha - 20.04%; 23.60 and 43.89 g/vessel, respectively, which is 65%-79% higher than in the control group. Relative grain yields of oats were obtained when applying semi-rotted manure at a rate of 60 and 80 t/ha and manure-lignin mixture at a rate of 40 t/ha - from 44 to 46 g/container. The action of the manure-lignin mixture at a rate of 80 t/ha and the lignin-melt mixture at a rate of 40 t/ha showed a tendency towards a decrease in the grain of oats, while the mass of straw and hay increased by 58 and 28%; 32% and 62% respectively.

The use of humic substances (HS) in combination with mineral fertilizers improves the agrochemical properties of soils and maintains their fertility. Humic acids form organomineral complex particles with soil mineral particles, capable of absorbing moisture and dissolved substances. HS bind the mineral particles of the soil and contribute to the formation of a water-resistant loose crumb-granular structure, enhancing the moisture-absorbing and agrochemical properties of soils. The nutrients present in such soils are not chemically bound to soil minerals, are not washed away by water, and remain in a form accessible to plants [4].

In work 5, the possibility of obtaining phosphorus-containing bicomposite fertilizers with increased resistance to water washing by impregnating porous substrates made of birch bark and bark with a K_2HPO_4 aqueous solution was shown. The conditions for obtaining bicomposite fertilizers with the highest resistance to phosphate leaching were determined: isothermal holding of the impregnated samples at 100°C for 2 hours; drying at 200°C and subsequent treatment with a 0.1 N HNO_3 solution. From fertilizers obtained under these conditions and containing 3.5-4 wt.% phosphorus, about 35% of phosphates are washed away by water within 72 hours, which ensures the effect of their prolonged action. It has been shown that to obtain fertilizers with high resistance to phosphate leaching, the amount of phosphorus applied to the substrate should not exceed 4.0 wt.%. It has been established that biocomposite fertilizers based on lump and bark substrates surpass industrial granulated fertilizers in their resistance to phosphate leaching.

The problem of phosphorus in agriculture has been of interest since the formation of agrochemistry as a science. This is due to the following factors. Firstly, the total content of this element in the vast majority of soils is lower than in other nutrient elements. Secondly, due to the element's chemical nature, along with its low content, it is characterized by very low mobility in the soil, i.e., poor availability for plants. Thirdly, the reserves of phosphate raw materials for fertilizer production are very limited, and some of them are practically unsuitable for industrial processing, for obtaining water-soluble phosphorus fertilizers. To maintain food production for the growing population of the planet, it is necessary to combine phosphorus management approaches not only to extend the service life of the remaining non-renewable phosphate reserves, but also to improve the efficiency and sustainable phosphorus cycle. Solutions include improving the efficiency of fertilizer application to agricultural lands along with better understanding of phosphorus cycling in soil-plant systems and the interaction between soil physics, chemistry, and biology in conjunction with plant characteristics [6].

The initial raw materials for the production of phosphorus fertilizers and other phosphorus-containing products are natural mineral phosphate ores - apatites and phosphorites. Phosphate ores differ in their physical and chemical properties depending on their mineralogical composition, structure, and impurity content. Phosphate ore reserves are mainly represented by phosphorites, the amount of apatite does not exceed 6% of reliable reserves, and its share is about 15%. The useful mineral in both types of raw materials is calcium fluorapatite, the composition of which corresponds to the formula $Ca_5(PO_4)_3F$. The most common in nature are calcium fluorapatite $3Ca_3(PO_4)_2CaF_2$

and hydroxyapatite $3Ca_3(PO_4)_2 \cdot Ca(OH)_2$. The richest industrial apatite-nepheline ore deposit in terms of concentration and reserves is located in the Kola Peninsula [7,8].

The identified phosphate ore reserves are accounted for in more than 76 countries and are estimated at 70587.4 million tons of P_2O_5, including 65328.4 million tons of phosphorite and 5259 million tons of apatite ores. In ten countries (Morocco, USA, China, Russia, Mexico, Kazakhstan, Peru, South Africa, Western Sahara, and Tunisia), 61015.4 million tons of P_2O_5 are concentrated, representing 87% of global reserves. Significant reserves of phosphate rocks have been identified at the bottom of seas and oceans, mainly on shelves [9].

Phosphorite deposits are found in many regions of Uzbekistan. A promising deposit for industrial development is the Central Kyzylkum region. To date, four phosphorite deposits have been identified: Jeroy-Sardarinsky, Jetymtau, Tashkurinsky, and Karakatinsky. Of these, the most studied is the Jeroy-Sardara deposit, where three areas have been explored: Jeroy Yuzhny, Kurukkuduk, and Tashkura, with total reserves estimated at 384,413 thousand tons of ore or 739,916 thousand tons of P_2O_5 [10,11].

The demand for phosphorus fertilizers in the agriculture of the Republic of Uzbekistan averages 660 thousand tons of 100% P_2O_5 per year. However, chemical enterprises produce only 150-160 thousand tons of 100% P_2O_5 per year, which is about 23% of the total demand. This means that the amount of phosphorus fertilizer applied to the soil in terms of P_2O_5 is 4.3 times less than the annual requirement. The main reason for this situation is the shortage of high-quality phosphate raw materials.

The limited production of phosphorite concentrate in the Central Kyzylkum and the lack of significant prospects for its growth necessitate, under the current conditions of soil phosphorus depletion, the search for alternative sources of mineral raw materials for phosphorus fertilizer production and increasing its efficiency [12; pp. 2260-265, 13; pp. 85-94].

There are phosphate raw material deposits in Karakalpakstan, with total estimated reserves of phosphorites in the region at 70-80 million tons. There are 7 zones of phosphorite deposits in Karakalpakstan. The P_2O_5 content in the phosphorite samples is relatively low, ranging from 6.19% to 22.84%. The highest content of P_2O_5 is observed in the ore from the Khujakul, Porlytau, and Nazarkhan deposits, especially in fractions smaller than 3 mm. [14; pp. 29-31].

Given the acute shortage of phosphorus fertilizers, these phosphorites can serve as a significant reserve for increasing phosphorus fertilizer production.

Currently, the most common phosphorus-containing fertilizer worldwide is simple superphosphate. This is mainly water-soluble calcium monophosphate $Ca(H_2PO_4)_2$. It is obtained by decomposing phosphate raw materials with sulfuric acid. When applied to neutral, bases-saturated soils, it relatively quickly transforms into $CaHPO_4$ and $Ca_3(PO_4)_2$.

$$Ca(H_2PO_4)_2+Ca(HCO_3)_2 = 2CaHPO_4 \times 2H_2O+2CO_2$$

$$Ca(H_2PO_4)_2+2Ca(HCO_3)_2 = Ca_3(PO_4)_2 +4H2O + 4CO_2Ca(H_2PO_4)_2$$

In such conditions, hydroxyapatite or fluorapatite, not assimilated by plants, may appear in the soils. In acidic soils rich in one and a half oxides, poorly soluble, difficult-to-absorb phosphorus compounds can form. For this reason, phosphate consumption generally does not exceed 25%. Consequently, the consumption of water-soluble phosphate fertilizers is much higher than the actual required amount of phosphorus [15].

The works [16-19] detail the significance and mechanism of action of organomineral fertilizers when used in agricultural production. The humic substances contained in fertilizers contribute to the better assimilation of essential nutrients by plants. They prevent the retrogradation of digestible phosphates, contain microelements, physiological and growth-active substances, form a loose structure, create favorable conditions for the life of microorganisms, stimulate the growth and development of plants.

Raw material sources for obtaining organic or organomineral fertilizers are manure, peat, lignin, sapropel, brown coals, and other organic substances of plant origin.

Licorice meal can serve as a good raw material for obtaining humic fertilizers. It should be noted that in Uzbekistan, more than thirty enterprises and companies of various forms of ownership are engaged in the procurement and processing of licorice root in various regions. It grows in the northwestern part of Uzbekistan - Khorezm, Bukhara regions, as well as in the Republic of Karakalpakstan [20].

Licorice is a herbaceous plant belonging to the legume family. Licorice leaves are used for medicinal infusions and decoctions, in addition, licorice hay is rich in proteins and is a good fodder for livestock, but the main medicinal properties are possessed by the plant's root. The chemical composition of the root includes malic, citric, and succinic acids, beta-carotene, a large number of vitamins, as well as mineral substances necessary for the human body: potassium, calcium, iron, phosphorus, magnesium, and others. The main biologically active substances of licorice root are triterpenoid compounds, mainly glycyrrhizic acid and flavonoids, the content of which is up to 25%. It should be noted that after processing the licorice root, i.e., after the extraction of glycyrrhizic acid and other biologically active substances, a significant amount of meal remains, more than 80% of the initial raw material (over 100 thousand tons per year in Karakalpakstan), which is a production waste, as well as a liquid solution of ammonium sulfate (0.5-1%), about 400 thousand tons, containing a certain amount of physiologically active substances [21-23].

From the above, it can be seen that to date, there is no method for converting the insoluble part of licorice meal into beneficial products such as humic acids, fulvic acids, or humino-like substances necessary for increasing and maintaining soil fertility. It should be noted that such studies have not been conducted on licorice root meal - a waste product of pharmaceutical production of medicines based on licorice root.

The purpose of the research is to study the processes of oxidation of licorice meal with hydrogen peroxide in the presence of acetic acid and to process the resulting oxidation product from the decomposition of phosphate raw materials with sulfuric acid into phosphorus-humus fertilizers.

Licorice root meal was used as the initial raw material, which was dried to air-dry state, then ground to a particle size of 0.25 mm. After drying and grinding, an average representative sample of more than 10 kg of meal was formed for analysis and research, from which weighed samples were taken to determine moisture content, ash content, extractive substances with water and alkaline solution. The obtained results of the initial meal analysis are presented in Table 1.

Table 1.

Chemical composition of the initial licorice root meal

Moisture, %	Ash content, %	The content of extractive substances extracted by a 1% NaOH solution, %	Content of extractive substances extracted by water, %	Insoluble organic, %
5.41	4.66	5.87	15.78	68.28

Table 2 presents the results of mass spectrometric analysis (ICP-MS) of licorice meal ash. The table demonstrates that licorice meal contains a wide range of microelements essential for plant growth and development.

Table 2.

Results of mass spectrometric analysis of licorice meal ash

Name and content of elements, in g/t									
Li	Be	B	Na	Mg	Al	P	K	Ca	Cr
59	1,80	16	12000	14000	80000	770	21000	65000	55

Porlitau phosphate raw material with the following composition, %: P_2O_5 - 15.76; $P_2O_{5sol.\ for\ citric\ acid}$ - 6.81; P_2O_5 by trilon-B - 5.96; CaO - 27.19; MgO - 1.57; Al_2O_3 - 1.03; Fe_2O_3 - 2.66; F - 1.88; CO_2 - 4.10; SO_3 - 1.3; $P_2O_{5total\ by\ lime}$ / P_2O_{5total} - 43.21; $P_2O_{5sol.\ by\ Tr\text{-}B}$ / P_2O_{5total} - 37.82%.

At the beginning of the work, the oxidation processes of the ground licorice meal to a size less than 0.1 mm were studied by a water solution of hydrogen peroxide in the presence of acetic acid at a mass ratio of the organic part of the licorice meal: H_2O_2: CH_3COOH = 100: (10-20): (0.1: 1) The experiments were carried out in a glass cylindrical reactor equipped with a thermostating jacket and a stirrer. An oxidizer solution was poured into the reactor, the specified temperature was set, the mixer was turned on, and a sample of ground licorice meal was loaded. At the end of the process, the reaction mass was dried to air-dry state and its ash content, moisture content, organic matter, and the yield of extractive substances with a 1% sodium hydroxide solution were determined, and analyses were conducted according to the methods described in the works [24,25].

Under optimal conditions, the oxidation state of the meal was 70.94%. The resulting oxidation product contains 87.78% organic matter, 35.88% humic acids, 26.39% fulvic acid, and 29.06% residual meal. We used this moist, thick mass of oxidized meal as a starting component for processing the decomposition product of phosphate raw materials.

In the next stage of the work, the processes of obtaining phosphorus-humus fertilizers by decomposing porlite phosphate raw materials of the above composition with sulfuric acid were studied. Sulfuric acid with a concentration of 92% was used to activate the phosphate raw material.

In the first stage of research on the process of obtaining phosphorus-humus fertilizers, phosphate raw materials were decomposed with sulfuric acid to convert the undigested form of P_2O_5 into the raw material into a form readily available to plants. The sulfuric acid norm was taken in amounts of 10, 20, 30, 40, and 50% of the stoichiometry for the formation of monocalcium phosphate according to the reaction.

$$CaO_{\text{ in phosphorus}} + 2H_2SO_4 \rightarrow Ca(H_2PO_4)_2 \cdot H_2O$$

At a sulfuric acid norm of 40% of the stoichiometry, 15.27 g of H_2SO_4 with a concentration of 92% is required to treat 100 g of phosphorus raw material.

Treatment of the phosphate raw material with sulfuric acid was carried out for 60 min. After the decomposition of the phosphate raw material with sulfuric acid was completed, oxidized meal was introduced into the mixture. It was taken in weight ratios of phosphorite: meal (organic part of oxidized meal) = 1: (0.20 - 1). Then, the resulting mixture was stirred for 30 minutes and neutralized with 25% aqueous ammonia to a pH of 4-4.5. Drying was carried out at 80°C, and granulation was carried out by the rolling method during the ammonization and drying process. The chemical composition and strength of the fertilizer granules were determined. The strength of 2-3 mm granules was determined using the IPG-1M granule strength gauge, with an average value of 2.1-2.5 MPa. The determination of all forms of P2O5 was carried out by the weight method by precipitating the phosphate ion with a magnesium-ammonium phosphate mixture, followed by calcination of the precipitate at 1000-1050 C according to GOST 20851.2-75. Nitrogen was determined according to GOST 26715-85. SO3 was determined by precipitation in the form of barium sulfate, and the CaO content was determined by titration with a 0.05 N Trilon B solution in the presence of a fluorescent indicator. The analysis results are presented in Table 3.

From the results, we see the following. The higher the sulfuric acid norm and the less phosphate raw material used, the lower the P_2O_{5total} content in the product, but the higher the relative content of the assimilable form P_2O_5. As can be seen from Table 4, at a phosphorite: meal ratio of 1:0.2 and a sulfuric acid norm of 10% of the stoichiometry for the formation of monocalcium phosphate, the composition (wt. %, P_2O_{5total} - 12.62; $P_2O_{5sol.\ for\ citric\ acid}$ - 6.91; $P_2O_{5sol.\ by\ Tr\text{-}B}$ - 5.53; organic substances - 16.02; extractive substances - 11.36; nitrogen - 0.62; $CaO_{tot.}$ - 21.75; relative content of $P_2O_{5ab.\ for\ citric\ acid}$ - 54.75%. With the same ratio of meal to phosphorite, but at a rate of 50% of the stoichiometry for the formation of monocalcium phosphate, the composition (wt. %, $P_2O_{5total.}$ - 11.11; $P_2O_{5sol.\ for\ citric\ acid}$ - 10.07; $P_2O_{5\ by\ Tr\text{-}B}$ - 6.64; organic substances - 14.08; extractive substances - 9.98; nitrogen - 2.64; $CaO_{tot.}$ - 19.15; the relative amount of $P_2O_{5ab.\ for\ citric\ acid}$ is 90.64, the assimilable form of phosphorus increases approximately 2 times.

The table also shows that with an increase in the amount of oxidized meal, the relative content of the assimilable form P_2O_5 increases. For example, at a phosphorite: meal ratio of 1:0 and a sulfuric

acid norm of 10% of the stoichiometry for the formation of monocalcium phosphate, the relative content of the assimilable form of P_2O_5 is 52.58%, at the same sulfuric acid norm for the formation of monocalcium phosphate, but at a phosphorite: meal ratio of 1:1, the relative content of the assimilable form of P_2O_5 is 62.09%.

Figures 1-2 show the X-ray diffraction patterns of the initial Porlitau phosphate raw material and the phosphorus-humus fertilizers obtained at a phosphorite:cake ratio of 1:0.4 and a sulfuric acid norm of 40% of the stoichiometry for the formation of monocalcium phosphate. X-ray structural

analysis was performed on a controlled XRD-6100 computer. Phase determination was carried out using local directories and ASTM.

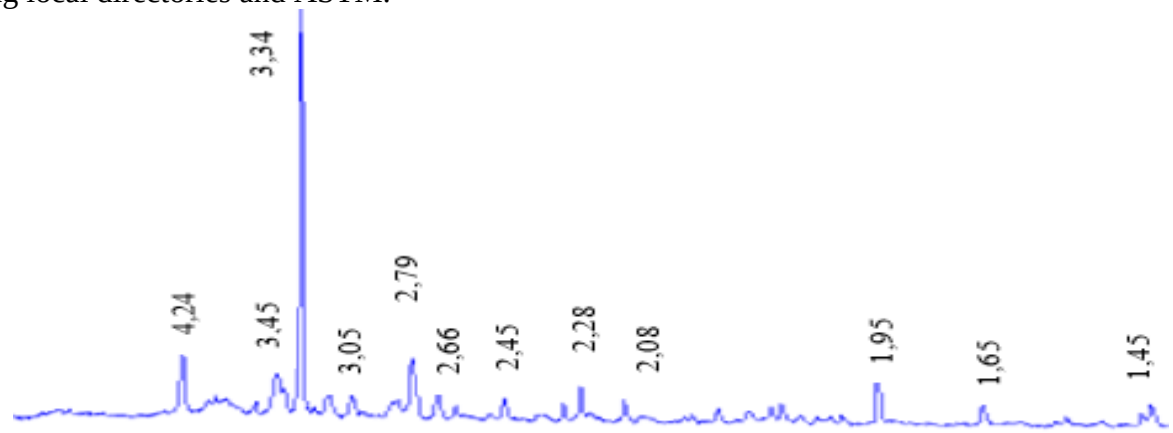

Fig. 1. X-ray diffraction pattern of Porlytau phosphate raw material

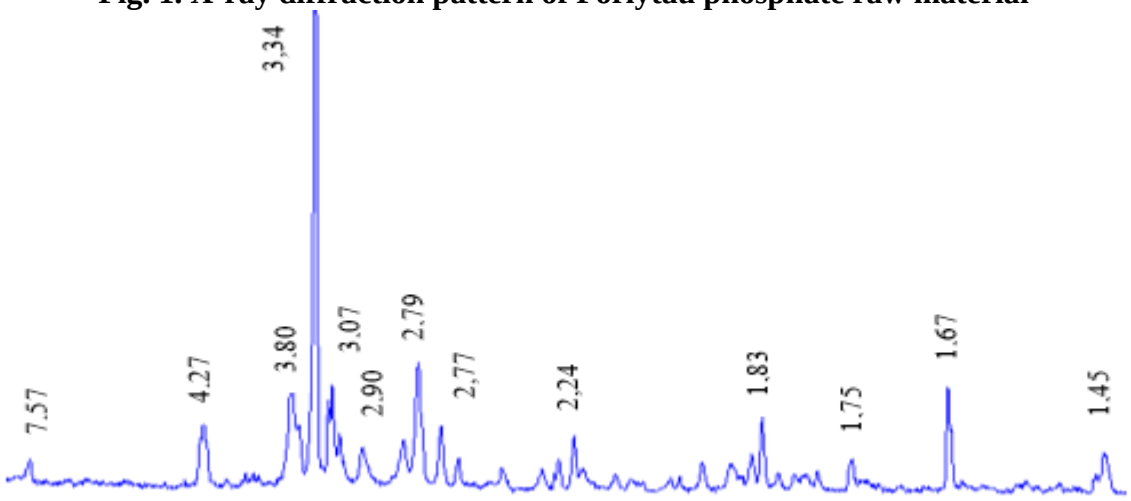

Fig. 2. X-ray diffraction pattern of phosphorus-humus fertilizers obtained by processing Porlytau phosphate raw materials with sulfuric acid and oxidized meal

On the X-ray diffraction pattern of phosphorite flour from the Porlytau deposit (Fig. 1), the diffraction lines are 3,05; 3.34; 2.79; 2.66; 2.45; 2.28; 1.95 Å belongs to fluorocarbonate apatite. The presence of calcite leads to a decrease in interplanar distances of 4.24; 2.79 Å, dolomite -1.95; 1.45 Å. The most intensive peaks were 2.45; 2.08; 3.45; 3.34; 4.24 Å indicates the presence of a large amount of silicon oxide. The lines 1.65 and 1.95 Å correspond to calcium fluoride and are equal to 2.08; 2.28 and 3.45 Å can be bound to $CaSiO_3$.

According to the X-ray diffraction pattern of phosphorus-humus fertilizer obtained by decomposition of Porlytau phosphorite flour with sulfuric acid and the addition of oxidized meal (Fig. 2). diffraction maxima are observed: monocalcium phosphate - 3.80; 2.79; 2.77; Å; dicalcium phosphate – 4,27; 3.07; 2.90 Å, tricalcium phosphate 3.44 Å, dolomite -1.83; 1.75 Å ammonium sulfate 2.32 Å, gypsum 1.67; 1.45 Å.

It should be noted that in the production of phosphorus fertilizers, the assimilable form of P_2O_5 decreases due to the retrogradation of phosphorus during ammonization and drying. And the combination of oxidized meal with phosphate raw materials in the production of phosphorus fertilizers leads to a significant increase in the relative content of the assimilable form P_2O_5. Obviously, when oxidized meal is added to the acidic superphosphate mass, organic acids, due to interaction with monocalcium phosphate and other phosphates, prevent the retrogradation process, due to which the assimilable form of phosphorus does not decrease, but, on the contrary, significantly increases during the ammonization of the superphosphate mass.

According to the requirements of modern agriculture, it is advisable that the relative content of assimilable forms of phosphorus compounds in complex fertilizers should be at least 50%. Therefore, we consider the optimal sulfuric acid rate for processing Porlitau deposit phosphorite flour to form monocalcium phosphate to be 40% of the stoichiometric norm, with a mass ratio of phosphorite to oxidized meal of 1:0.4. Under optimal conditions, the fertilizer composition (by weight %) is as follows: P_2O_{5total} - 10.08; $P_2O_{5sol.\ for\ citric\ acid}$ - 8.51; organic substances - 23.83; humic acids - 16.90; nitrogen - 2.31; CaO_{total} - 17.41; relative content of citric acid-soluble P_2O_5 - 84.42; moisture content - 5.46; SO_{3total} - 8.02; granule strength 2.1 MPa.

The optimal technological regime of the phosphorus-humus fertilizer production process is as follows: grinding of licorice meal to particle size less than 0.25 mm; hydrogen peroxide concentration 10%; organic part of licorice meal: weight ratio of H_2O_2 and acetic acid 100: 1: 0.1; sulfuric acid rate for decomposition of phosphate raw materials 40% of stoichiometry of the mineralized mass to $Ca(H_2PO_4)_2$; weight ratio of organic part of the meal to phosphorite 1: 0.4; oxidation temperature 60°C; oxidation duration 60 minutes; phosphorite decomposition duration 30 minutes; neutralization of pulp with ammonia to pH 4.5; neutralization duration 20 minutes; product drying temperature 80-100°C.

Conclusion. Thus, to increase the content of humic substances and organic acids in licorice meal, the process of hydrogen peroxide oxidation in the presence of acetic acid was studied depending on the oxidizer concentration, temperature, and the weight ratio of the organic part of the meal to the anhydrous part of hydrogen peroxide. The content of humic substances and functional groups in the oxidation products of meal was determined, and a technology for obtaining phosphorus-humus fertilizer by adding oxidized meal to the acidic superphosphate mass before ammonization and drying was developed. This, on the one hand, allows for a significant increase in the relative content of assimilable forms of P_2O_5, and on the other hand, reduces the sulfuric acid norm for the decomposition of phosphate raw materials. When these fertilizers are applied in agriculture, the humus content in the soil will undoubtedly increase, and the soil structure and physical-mechanical properties will significantly improve. By containing all the necessary nutrients for plants, the possibility of obtaining higher and better yields is created, and the nutritional properties of plants and their resistance to diseases are increased.

"ARAL SEA FRAGMENTS" HYDROECOLOGICAL SIGNIFICANCE AND PROTECTION OF THE LAKES SUDOCHYE AND JULTURBAS IN THE CONDITIONS OF THE SOUTHERN ARAL SEA REGION

Kalenderova K.T., Xojamuratov R.T.

Summary: *This report represents a comprehensive analysis of the hydro-ecological state, dynamics, and environmental significance of the two key water bodies of the Southern Aral Sea region: Sudochye and Julturbas lakes. In the context of the ongoing Aral crisis, these lakes, which are remnants of the ancient Amu Darya delta, play a crucial role in preserving regional biodiversity. Particular attention is paid to the factors determining their vulnerable hydrochemistry (high mineralization, anthropogenic pollution) and hydrobiological value (preservation of the Aral's native fauna and its role in bird migration). The report emphasizes the international recognition of these objects through their inclusion in the Ramsar Convention [2] list of wetlands and justifies the need for further comprehensive measures to preserve them.*

Key words: *Southern Aral Sea Region, Sudochye Lake, Julturbas Lake, Hydrochemistry, Mineralization, Ramsar Convention, Aral Sea, Collector-Drainage Flow.*

Introduction. The South Aral Sea region is characterized by one of the most acute global ecological crises caused by the catastrophic drying up of the Aral Sea [1]. The decrease in sea level led to the formation of an extensive salt-dust bed (Aralkum), desertification, and degradation of the Amu Darya delta. Against this backdrop, the system of residual water bodies, such as the Sudochye and Julturbas lakes, is gaining strategic importance as the last stronghold of water and biodiversity.

Both lakes are relic formations that were former bays or large expanses of the Amu Darya delta, closely connected with the Aral Sea. As it regressed, water bodies were cut off and began to exist due to residual runoff and collector-drainage waters.

The conducted studies of the hydrochemical and hydro-ecological state of the Sudochye and Julturbas lakes allow for the formation of a comprehensive, scientifically based assessment of the transformation of the Amu Darya delta's aquatic ecosystems in the context of the ongoing Aral crisis. Comparison of long-term data on the level, mineralization, ionic composition, biogenic elements, and technogenic pollutants shows that both bodies of water are subject to the persistent impact of anthropogenic and natural-climatic factors that determine the direction and rate of their degradation.

The state of lakes is extremely unstable and directly depends on the volumes of water supply and the effectiveness of regulating structures. The water levels in the lakes during the study period changed: in Julturbas from 50.63 m to 52.03 m, in Sudochye from 50.71 m to 53.24 m.

Changes in the long-term water level regime lakes depend on various factors. The contribution of these factors can be assessed, analyzing the water balance equation. Total for 2008-2022 in lakes 55.81 km^3 of water was received, of which 30.07 km^3 was discharged into the lower lakes and the sea. The largest amount of water entered the lakes in 2010 - 17.02 km3, of which 12.81 km^3 was discharged into the lower lakes and the sea, and 4.21 km^3 of water remained in the lakes themselves. As a result, the maximum water level was observed in 2010. Including, the water level rose to 52.37 m in Julturbas, 56.78 m in Sudochye, and 65.38 m.

It has been established that the decrease in Amu Darya's flow over many years, resulting from the regulation of the riverbed and increased water consumption in irrigated agriculture, is a key factor in the formation of water resource deficit in the delta zone. The observed decrease in water intake volumes into lakes, combined with high evaporation values, leads to a reduction in the area of the water mirror, a decrease in depth, and an intensification of salt concentration processes. The variability of Sudochye and Julturbas lakes' levels during the 2008-2022 period demonstrates a significant dependence of their regime on the volumes of collector-drainage runoff supplied. The maximum levels recorded in 2010 correlate with increased water supply volumes, confirming the direct relationship between the hydrological state of lakes and the regulation of delta water flows.

Relatively shallow depth makes water bodies extremely vulnerable to intense evaporation in the region's arid conditions.

Long-term drought periods (for example, 2020-2024) led to a critical reduction in the water mirror area - to **40-60%** of the average long-term values. In the driest years, Julturbas may dry up almost completely. The decrease in water volume leads to further concentration of salts. To maintain the lake system, efforts were made to create artificially regulated water bodies, including the construction of dams and embankments, which allow for the retention of river water and the directing of regulated flow to former sea bays (especially in Julturbas).

The Southern Aral Sea region is characterized by a hyperarid climate, high evaporation (up to 1500-2000 mm/year), and low natural delta flow of the Amu Darya. Under such conditions, increased mineralization, active sulfation, chloridation processes, and an increase in the concentration of biogenic and technogenic pollutants are formed.

The hydrochemical indicators of both lakes are characterized by a stable tendency towards an increase in mineralization. For Sudochye Lake, 17-25 g/l, and for Julturbas, 12-20 g/l have been established, which corresponds to highly mineralized and hypersaline waters. The intensification of the chloride-sulfate profile of lakes indicates the predominance of evaporative concentration and salt accumulation processes under conditions of limited water exchange.

The Julturbas and Sudochye lakes belong to saline-saline residual water bodies fed by: collector-drainage waters, residual floods, groundwater (table 1,2). The mineralization of Lake Sudochye is one of the highest in the delta zone. Water type: sodium chloride-sulfate, less commonly sodium-magnesium.

The ionic composition of waters is determined by dominance Na^+, Mg^{2+}, Cl^- и SO_4^{2-}. Sudochye Lake is characterized by an increased concentration of chlorides and sodium, while Julturrbas demonstrates relatively high values of sulfate ions, reflecting the geochemical features of the basin's groundwater and the spatial disunity of the lake system.

Table 2

Mineralization range of Sudochye Lake by years

Period	Mineralization, g/l
1960s	2–4
1980s	8–12
1990s	15–20
2000–2010	18–28
2020–2024	**17–25**

The increase in mineralization is related to: the shrinkage of the lake area, the lack of river feeding, high evaporation, and the inflow of KDS with a salinity of 5-12 g/l.

Table 3

Average concentrations of basic ions (last 5-7 years):

Indicator	Value
$Na^+ + K^+$	1500–3000 mg/l
Mg^{2+}	300–600 mg/l
Ca^{2+}	200–350 mg/l
Cl^-	2500–4500 mg/l
SO_4^{2-}	1500–2800 mg/l
HCO_3^-	80–150 mg/l

Magnesium and sodium dominate almost the entire year; sulfates and chlorides are the main anions. Sudochye undergoes eutrophication.

Concentration component

$N–NO_3$ 2–6 mg/l

$N–NH_4$ 0.5–1.2 mg/l

$P–PO_4$ 0.15–0.35 mg/l

Fe общ. 0.8–2.0 mg/l

In both bodies of water, stable concentrations of biogenic substances, typical for eutrophic and hyper eutrophic systems, are recorded. The highest values of nitrates, ammonium, and phosphates are observed in Lake Sudochye, which is related to the inflow of organic and mineral compounds with collector-drainage runoff. These processes intensify bioproduction and contribute to the formation of secondary pollution, including oxygen deficiency in the bottom layers.

High values are associated with CDP sewerage and organic biodegradation. Organic pollutants and heavy metals **, Pb:** 0.01–0.05 mg/l; **Cd:** 0.001–0.005 mg/l; **Zn:** 0.1–0.25 mg/l; **Cu:** 0.01–0.05 mg/l; Petroleum products: 0.1–0.3 mg/l, **Phenols:** to 0.002–0.009 mg/l. Sudochye is characterized by complex technogenic saline waters, the consequences of long-term drainage runoff. Julturbas Lake is smaller than Sudochye, and its chemical composition changes more rapidly due to its shallow depth and seasonality (table-3,4). Water type: sulfate-chloride sodium-magnesium.

Table -4

Mineralization range by years of Lake Julturbas

Period	Mineralization, g/l
1960s	1–2
1980s	4–6
1990s	7–10
2000s	10–16
2020–2024	**12–20**

In highly saline years, the mineralization can reach 22-25 g/l.

Concentration Indicator

$Na^+ + K^+$	1000–2000 mg/l
Mg^{2+}	250–500 mg/l
Ca^{2+}	150–250 mg/l
Cl^-	1500–3000 mg/l
SO_4^{2-}	1200–2500 mg/l
HCO_3^-	60–120 mg/l

The water is more "sulfate" than in Sudochye, which is associated with the evaporation and mineralization of groundwater. Biogenic substances are characterized by summer peaks of nitrogen and phosphorus.

Component	**Value**
$N–NO_3$	1–4 mg/l
$N–NH_4$	0.3–0.9 mg/l
$P–PO_4$	0.1–0.25 mg/l

The load is lower than in Sudochye, but eutrophication is pronounced.

Pollutants , **Zn:** 0.05–0.12 mg/l, **Cu:** 0.01–0.04 mg/l, **ПАВ:** 0.1–0.2 mg/l

Нефтепродукты: до 0.1–0.2 mg/l.

Julturbas is more isolated, therefore it contains fewer technogenic metals, but the concentration of organic matter is higher in summer (Table-5).

Comparative analysis of the hydrochemistry of two lakes

Indicator	Sudoche	Julturbas
Mineralization	17-25 g/l	12-20 g/l
Dominant type	chloride-sulfate	sulfate-chloride
$Na^+ + K^+$	above	below
Mg^{2+}	average	higher in arid periods
Biogenic elements	high (eutrophication)	moderate
Petroleum products	0.1–0.3 g/l	0.1–0.2 mg/l
SFM	0.2–0.4 g/l	0.1–0.2 mg/l

Sudochye is more technologically loaded, Julturbas is more stable, but quickly salinizes. An increase in the permissible concentrations of a number of heavy metals (Zn, Cu, Pb, Cd) and petroleum products, especially in Lake Sudochye, has been recorded. The sources of these components are industrial, agricultural, and municipal-domestic wastewater flowing directly into the delta or through collector-drainage water systems. Julturbas Lake is less susceptible to technogenic load, however, its shallow depth increases its sensitivity to seasonal changes and contributes to the rapid accumulation of salts and organic matter.

The conducted research allowed us to establish that the hydrochemical state of the Sudochye and Julturbas lakes is formed under the influence of a complex of natural-climatic and anthropogenic factors that determine the progressive transformation of the aquatic environment in the conditions of the Southern Aral Sea region.

The main processes determining the current state of water bodies are the reduction of the steady flow of the Amu Darya, high evaporation, the inflow of mineralized collector-drainage waters, and the geochemical activity of bottom sediments. The analysis results show that the mineralization of lake waters has reached values characteristic of slightly saline and hypersaline systems. The ionic composition is determined by the predominance of sodium and magnesium chlorides and sulfates, which indicates an intensifying evaporative concentration and a change in the hydrochemical regime towards a more complex salt profile. Sudochye Lake is characterized by higher concentrations of biogenic substances, heavy metals, and petroleum products, reflecting the persistent technogenic impact in the delta collector-drainage system zone. The Julturbas lake is characterized by a pronounced seasonal mineralization dynamic and increased sensitivity to hydroclimatic changes due to its shallow depth and limited water exchange.

The obtained results confirm the need to develop and implement a set of measures aimed at stabilizing the hydrochemical regime of delta water bodies. Priority measures include: optimizing the distribution and quality of collector-drainage waters, creating buffer environmental zones, implementing local treatment solutions, and improving the environmental monitoring system, with an emphasis on heavy metals, petroleum products, and biogenic substances. Thus, the study demonstrates that further preservation of the Sudochye and Julturbas lakes is possible only under the condition of systematic regulation of water management flows, maintaining the minimum necessary ecological flow, and implementing targeted environmental protection measures. The obtained data can serve as a scientific basis for developing regional water resource management programs and improving the ecological sustainability of the delta ecosystems of the Southern Aral Sea region.

Conclusion

The study established that the Sudochye and Julturrbas lakes belong to the category of highly mineralized, environmentally vulnerable water bodies, the hydrochemical regime of which is entirely dependent on the volumes and quality of incoming collector-drainage waters and the climatic conditions of the region. The decrease in the natural flow of the Amu Darya River over many years is a key factor in the degradation of the lake system, determining the decrease in water levels, the reduction of the water mirror area, and the intensification of salt concentration processes.

The mineralization of lake waters has increased more than 3-6 times over the past decades and currently reaches: Sudochye - 17-25 g/l, Julturbas - 12-20 g/l, reflecting the steady strengthening of the salt background and the transition of water bodies to the category of hypersaline systems.

The ionic composition of waters is characterized by the predominance of sodium and magnesium chlorides and sulfates. The chemical structure of water is formed under the influence of evaporation processes, the inflow of mineralized KDS, and the geochemical activity of bottom sediments. The concentrations of biogenic substances (nitrates, ammonium, phosphates) correspond to the eutrophic state of water bodies, most pronounced in Lake Sudochye. This indicates a persistent organomineral load and the risk of secondary eutrophication.

To stabilize the hydro-ecological state of lakes, it is necessary to implement a set of environmental protection measures: optimizing the regime of collector-drainage water supply, creating buffer filtration zones, local wastewater treatment, maintaining minimal ecological runoff, and expanding the monitoring system.

WONDERS OF THE GREEN PLANET

Tursunova Sh.A.
Kokand State University

Summary: *This treatise is written about the distribution of the plant world and their practical importance in maintaining bioecology in nature.*

Key words: *biogenic, cell, biological factors, plant species, biosphere*

The total area of our Earth is equal to 510 million km^3. Of this, the land area is 149 million km^2, where there are nearly 500.000 species of plants. A common feature for all of them is the specific structure of their cells, specifically, the hard cell wall is a common structure for all plants. If the cell wall is lost for some reason, the protoplast beneath it will be covered with a membrane after a certain period. A cell covered with a hard membrane wall has the ability to take in substances necessary for life from the external environment in a dissolved state. [1].

The "absorption" of nutrients is probably another one of its characteristics which is the reason for their low motility/movement. Many long-lived trees grow in one place for hundreds, even thousands of years (sequoia), due to this hard cell wall. Using a very low concentration solution for nutrition is also one of their important aspects. The growth of plants in one place has created unique aspects of their distribution. For plant propagation, the plant has created a single cell – a spore, a part of its body (a modified shoot) – a spore, and a seed.

In our usual understanding, "Plants" are organisms with similar adaptations in terms of nutrition; they are ecological groups, not based on their origin (phylogenetically).

Plants grow over very large areas across the continents of the globe. Even the ice-free areas of the Arctic are occupied by some mosses and lichens.

Life on Earth exists as a result of the influence of the Sun and the atmosphere on plants in the land and oceans. Despite the abundance of sunlight, green plants utilize only 1-2% of it. From this small amount, they still create a very large quantity of organic material. For this, they use very little water. Water is stored in the cytoplasm, vacuole, and cell wall. A considerable amount of water is also present in the tissues of the stem, root, and leaves. Living cells use water and nutrient substances as much as needed [2].

The water content in plants is 90-95% even within a single species. In juicy fruits and algae, it reaches up to 98%. Water participates in all chemical reactions, including photosynthesis, that occur in the plant. The necessary component in photosynthesis is carbon dioxide, whose share in the atmosphere is only 0.0321%. Green plants containing chlorophyll use this very small amount of carbon dioxide every year to create hundreds of billions of tons ($4.5x10^{11}$) of organic matter. Photosynthesis is an oxidation-reduction process. Water splits (is oxidized), releasing oxygen, and gives hydrogen, which reduces the carbon dioxide.

There are two sources of oxygen in the atmosphere: water vapor under the influence of ultraviolet rays and photosynthesis.

In photosynthetic organisms, chlorophyll is located in the chloroplasts, and their number ranges from 20 to 100. In large trees, there are tens of billions of chloroplasts, but only one in single-celled green algae. The primary product of photosynthesis is used in the chemical processes inside the cell and in the formation of nucleic acids, proteins, and other complex compounds [3].

The adaptation of plants to specific external environmental conditions during their ontogenesis is considered the result of their evolution (in terms of variability, heredity, and selection). During the evolution of the phylogeny of plants belonging to each species, an adaptation to the ecological conditions occupied by that plant has occurred.

The characteristics of the plant related to being moisture-loving or cool-loving, tolerant to heat or cold, and a number of other ecological features have been formed over a long period during the

process of evolution. This is because heat-loving plants and short-day plants in our conditions differ from the less heat-demanding, long-day plants in the northern regions.

In nature, each individual plant in a given geographical area grows in an ecologically suitable location based on its biology: moisture-lovers grow near water bodies, shade-lovers grow in places where sunlight does not fall directly, and so on.

The heredity of plants is formed under specific external environmental conditions. In this regard, the influence of external environmental factors during the plant's ontogenesis (development) is also of great importance. Plants, seedlings, and transplants of agricultural crops often form adaptations as a result of the struggle for life that arose from historical development in response to the unfavorable effects of one or another environmental factor. Plants effectively protect themselves from unfavorable abiotic and biotic factors of the external environment. Agricultural crops are sown in a certain region taking their resistance (tolerance) into account.

The adaptation of plants to the specific climate and soil conditions of the external environment occurs as a result of the physiological mechanisms (physiological adaptation) taking place in them, and through hereditary variability and natural selection (genetic adaptation) within the population of organisms.

The factors that occur in the external environment happen both lawfully (regularly) and randomly (by chance). The need for protection during the naturally occurring changes in the external environment, such as the change of seasons, creates hereditary adaptations in plants to these phenomena. [4].

The plants on our Earth have been historically formed as a result of natural and artificial selection. This selection was realized under the influence of the following: 1) hereditary variability; 2) homologous series of variability; 3) mutations, hybridization, and recombination.

Species that are well adapted to their habitat in natural conditions successfully reproduce. The development cycle of plants occurs under the combined influence of the genotype and environmental factors.

Each continent of our Earth's globe has its own flora, meaning its families and species form phytocenoses (plant communities).

The complex of phytocenoses, in forming the plant cover, is under the combined influence of factors such as light, heat, moisture, air, soil, and relief, together with biogenic (zoogenic, phytogenic) factors, and leads its life with periodicity (cyclically). [5].

As is known, the air we breathe was created by green plants. About 500 million years ago, green plants began to conquer the land.

Currently, all the Earth's continents are covered with plants, except for the glaciers of Antarctica, Greenland, and certain high mountain ranges and dry deserts. Individual plants, such as the moss-like *Arenaria musciformis*, are also found at an altitude of 6218 m.

As is known, plants thrive in tropical forests. The height of the plant layer in these areas is up to 50 m, with individual trees rising 20-30 m above that. The Mammoth Tree growing in Western North America reaches heights of 100-115 meters. They determined that the tallest one is 142 m. According to some data, the Eucalyptus (*Eucalyplus amygdalina*) growing in Australia reaches 150-155 m.

The main mass of plants in the world's oceans is distributed in the top 50 meter layer of water, and often on the surface of the top 20 meters of it. Below 200 meters, there are no groups of plants that carry out photosynthesis. Algae with assimilating pigments have also been found at depths of 500-600 meters in the oceans. In many cases, these turned out to be sunken, heterotrophically feeding organisms. They also determined that living bacteria (heterotrophic organisms) exist at depths of 10,400 m. [6].

The thickness of the layer where living life exists constitutes only 0.00001 of the Earth's radius at most. It is difficult to say how many plant species grow within the composition of the phytosphere in this layer. There are many reasons for this. Firstly, the plants in all regions of the Earth have not yet been fully studied. It is not surprising that around 2000 new species of plants are being identified and discovered every year. [2].

There are also contradictions in the data regarding the number of species; for example, while one group of specialists says fungi have 35000 species, others write that they number 40-50 thousand, or even more than 100000. [7].

Taken as a whole, it is currently estimated that there are approximately 400,000 species of plants on Earth. This figure is significantly less than the total number of species in the animal kingdom – the number of animal species in our land and oceans constitutes nearly one million. The number of species in the main groups of plants is approximately as follows:

Bacteria (*Bacteriophyta*)	1200
Blue-greenalgae (*Cyanophyta*)	2000
Gold-colored algae (*Chrysophyta*)	1000
Diatom algae (*Bacillariophyta*)	14000-1600
Yellow-green algae (*Xanthophyta*)	300
Brown algae (*Rhaeophyta*)	1500
Red algae (*Rhodophyta*)	3800
Cryptophyte algae (*Cryptophyta*)	1200
Green algae (*Chlorophyta*)	8000
Euglena algae(*Euglenophyta*)	500
Fungi (*Fungi, Mycata*)	40000-5000
Lichens (*Lichenes*)	20000
Moss-like ones(*Bryophyta*)	2500
Spore tissue plants (*Pleridophyta*)	1100
Open-seed plants (*Gymnospermae*)	600
Closed-seed or flowering ones (*Angispermae*)	260000

Approximately 34000-35000 species of algae, with the exception of some, are found in water, and 55-60 percent of those are distributed in the seas. We cannot say that the numerical data we have provided is exactly that much. Precise data is currently unavailable. Nearly 1000 species of higher plants are distributed in freshwater, and around 40 species are distributed in saltwater in our vicinity.

In short, plants have adapted to live in any environment, from deserts to mountains to gardens to hills and even hot springs. Flora is one of the most important natural factors on Earth and is a source of oxygen that is essential for both humanity and the animal world.

ASSESSMENT OF HYDROLOGICAL INDICATORS OF AMU-BUKHARA CANAL IN BUKHARA OASIS

Khozhamuratova R.T., Zhumaeva T.A.
Karakalpak State University name after Berdakh,
Bukhara state Technical University

Summary: *This article analyzes the interannual fluctuations in the water levels of the Amu-Bukhara machine canal and the Kerki hydropost in the Bukhara oasis. At the same time, the relationship between the water levels of the Amu Darya River (Kerki hydropost) and the water levels of the Amu-Bukhara machine canal is studied.*

Key words. *Hydrological regime, hydrochemical regime, irrigation water, collector-drainage water, groundwater.*

Introduction. Intensive use of water resources to meet the needs of various sectors of the economy leads to a violation of the natural hydrological and hydrochemical regime of water bodies, significant changes in the water regime in their basins, water abstraction, and most importantly, to an increase in the mineralization of water. These changes are expressed in the length and temporal distribution of river flows, as well as in the salinization of water basins as a result of an increase in the share of return waters. [2; 6085-6095].

These changes are particularly significant in areas where rivers are almost non-existent, especially in arid and semi-arid regions, where water flow is almost not used in economic sectors.

As a result of human activity, the construction of reservoirs, the diversion of water to irrigated lands, industrial, urban and agricultural water supply, urbanization, and others affect the hydrological and hydrochemical regime of rivers.

The study analyzed the annual changes in the amount of water supplied to the irrigated lands of the Bukhara oasis through the ABMK. For this purpose, water consumption data measured in the ABMK for the years 1990-2021 were used. Calculations were made for the vegetation and non-vegetation periods. At the same time, annual fluctuations in the amount of water at the Kerki hydropost were studied (1-picture).

Picture 1 below shows the dynamics of water withdrawals from the Amu Darya to the ABMK for the vegetation (Wv) and novegetation (Wnv) periods. The largest amounts of water withdrawn during the vegetation period fell on 2006 and 2017. In these years, the amount of water withdrawn from the Amu Darya amounted to 4118.8•106m3 and 4325.2•106m3, respectively. The largest indicators during the novegetation period also fall on these years.

The largest values of the annual flow volumes received from the Amu Darya to the ABMK were also observed in these years, amounting to 6541.6•106m3 and 6585.3•106m3, respectively. The amount of water received to the Bukhara oasis through the ABMK increased in all calculation periods. It should be noted that it is also important to determine the relative values of the total amount of water received from the Amu Darya to the ABMK during the year during the vegetation and non-vegetation periods. During the calculation period, i.e. 1990-2021, the amount of water received during the vegetation period changed by 57.9÷76.3% compared to the annual average. The relative values of the amount of water received during the vegetation period changed by 23.7÷42.1%. In the total accounting years, the amount of water taken during the growing season averaged 65.9%, and during the non-growing season it was 34.1%.

The annual fluctuations in the amount of water taken from the Amu Darya to the ABMK during the vegetation and non-vegetation periods, as well as the water volume at the Kerki hydropost, were studied (Picture 1).

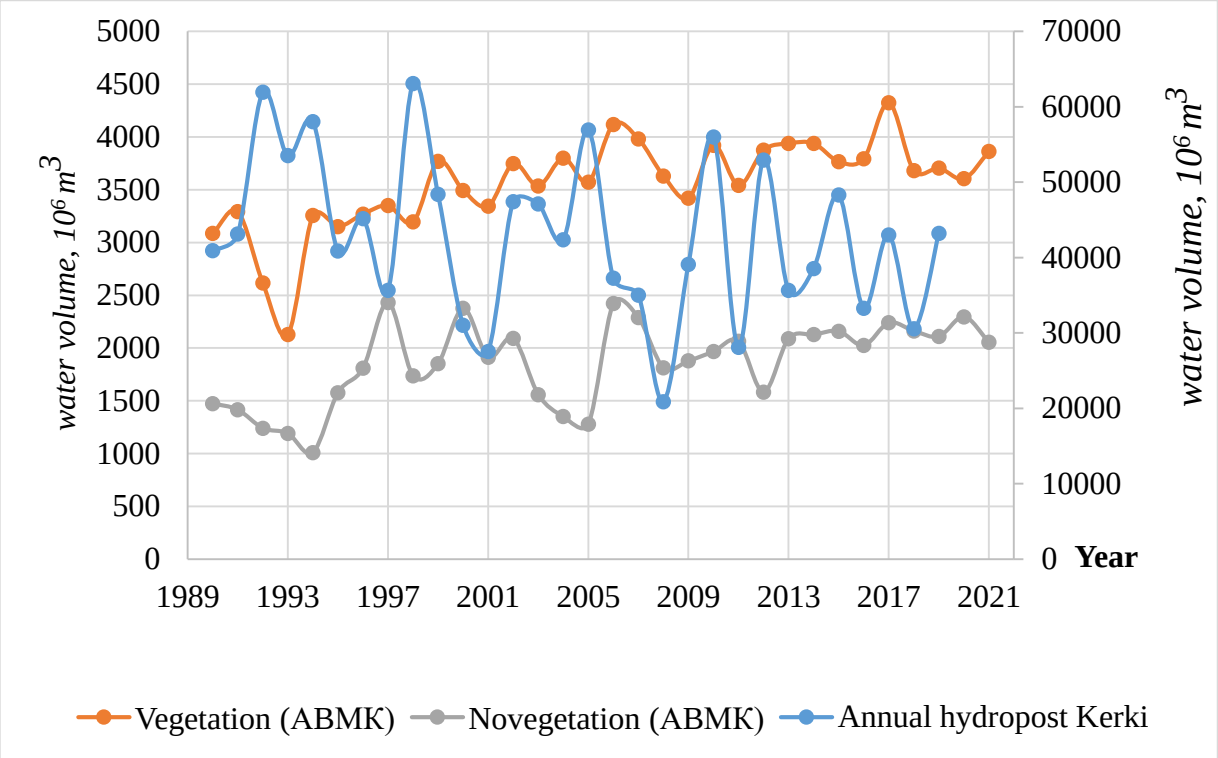

Figure 1. Interannual fluctuations in the amount of water taken from the Amudarya River and its discharge to the AMBK (1990-2021)

Table 1

Relations between the volumes of water taken from the Amudarya River (Kerki hydropost) and the ABMK

т/р	Connection type	Regression coefficient	Correlation coefficient and its error $r \pm \sigma_r$
1.	$W^{V}_{ABK} = f(W\text{керк})$	0,23	0,479 ÷ 0,09
2.	$W^{V}_{ABK} = f(W\text{керк})$	0,1	0,316 ÷ 0,14
3.	$W^{NV}_{ABK} = f(W\text{керк})$	0,32	0,565 ÷ 0,09

The analysis of the relationship between the amount of water in ABMK and the Amudarya River (Kerki hydropost) showed that the relationship between them is not high.

Conclusion. The annual fluctuations in the amount of water taken from the Amu Darya to the ABMK during the vegetation and novegetation periods were analyzed. Over the observation period, i.e. 1990-2021, the amount of water taken during the vegetation period varied within the range of 54.9÷76.3% compared to the annual average. The relative values of the amount of water taken during the novegetation period ranged from 23.7÷42.1%. Over the entire calculation period, the amount of water taken during the vegetation period averaged 65.9%, and during the novegetation period - 34.4%.

The dynamics of the amount of water received from the Amu Darya to the Bukhara oasis through the Amu-Bukhara machine canal was studied. During the accounting years, the annual flow varied in the range of 3319.5÷6565.3•106m3. The smallest value of these figures fell on 1993, and the largest on 2017;

Correlation relationships between total mineralization and major ions will make it possible to determine all the ions in the future by determining only the mineralization in the laboratory.

It is required to analyze the hydrological and hydrochemical quality of drinking water as well as the quality of drinking water.

GEOLOGICAL STRUCTURE OF THE ALTYNTAU KAOLIN DEPOSIT IN CENTRAL KYZYLKUM

Mirzayev A.U[1]., Yusupov H.R[1]., Toshtemirov Sh.A[2].
[1]Navoi Branch of the Academy of Sciences
[2]National University of Uzbekistan named after Mirzo Ulugbek

Summary: *The Altyntau kaolin deposit in the Central Kyzylkum region represents a unique geological and industrial site, the study of which is important for both fundamental and applied geology. The article highlights the deposit's geological structure, lithology, tectonics, mineralogy, geochemistry, and industrial evaluation. It emphasizes the genetic features of kaolin formation, their distribution within the weathering crust, and industrial applicability, as well as provides recommendations for further research, including associated minerals and rare-earth elements.*

Key words: *Kaolin, weathering crust, granitoids, mineralogy, geochemistry, prospective resources, rare earth elements, Altyntau, Uzbekistan.*

INTRODUCTION

The "Altyntau" kaolin clays deposit, located in the western part of Uzbekistan, is a unique geological object with high industrial potential. Kaolin is used in the ceramic, refractory, paper, and rubber industry. Studying the geological structure, mineralogical composition, and predicted resources is crucial for the rational development of the deposit. The kaolinization of rocks is due to the interaction of geochemical processes, hydrothermal fluids, and tectonic activity. The work examines the features of the formation of primary and secondary kaolins, their placement in various morphological and stratigraphic complexes, and provides a predictive assessment of their reserves and industrial significance [1].

Degree of study of the problem and research methods. Geological study of the area began in the 1930 s. In 1953, a 1:100000 scale state survey was conducted, and in 1961, a geological map was published. In 1970-1974, a 1:50000 scale survey was carried out, which allowed for detailed dissection of sedimentary-metamorphic rocks and igneous complexes.

The first information about ancient weathering crusts dates back to the 1940s, and their systematic study began in the 1960s. It was shown that thick kaolin crusts formed during the pre-glacial period. In 1970-1977, Uzbekistan's territory was regionalized for the preservation of weathering crusts, and a map of their distribution was compiled, where linear and area types were identified, and a mineralogical-chemical characterization was provided.

In 1994, the "Химгеолнеруд" expedition prepared a report on the study of kaolin clays and the assessment of refractory and ceramic raw materials of the Altyntau massif [2-3].

Geological structure of the deposit. The "Altyntau" deposit is located on the southern slope of the Zirabulak gorst-anticlinorium within the Zeravshan-Turkestan zone. It is confined to granites of the Late Paleozoic complex, which have undergone deep kaolinization. The geological structure is complicated by a system of submeridional and sublatitudinal faults that control the depth of kaolinization and fragment the usable layer into individual blocks.

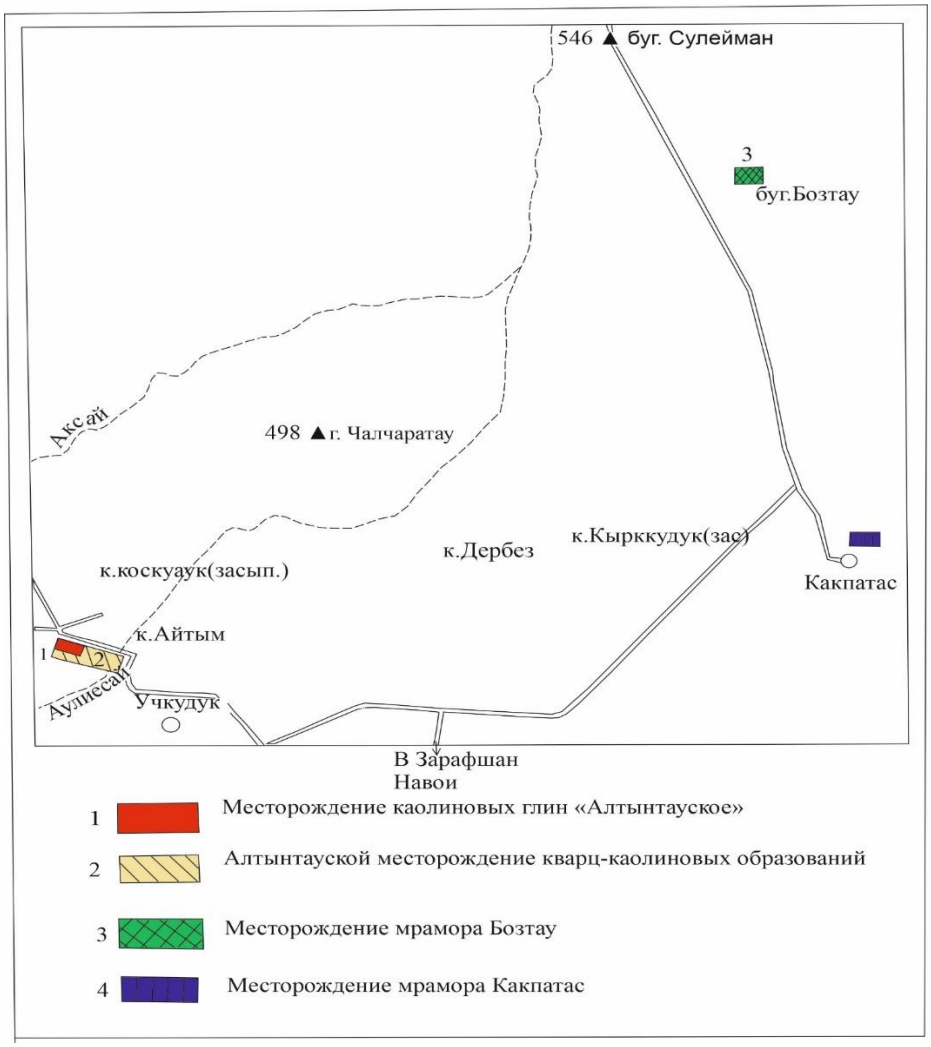

Fig. 1. Overview map of the work area, scale 1:2000000

The foundation of the deposit is represented by metamorphosed Proterozoic strata: siliceous shales, quartzites, and phyllites. These are exposed by drilling at depths of 5-10 m and are overlain by Cenomanian and kaolinite deposits. Mineralogically, these rocks are enriched with quartz and hydromicas, indicating a high degree of metasomatic alteration.

The main industrial object is the pre-bull weathering crust, formed on granites under long-term subtropical climate conditions. It is characterized by a distinct zonality: above it, a completely clay zone with a kaolinite content of over 60% is distinguished, white in color, and soft in structure. Below, the texture of the parent rock is preserved, but the degree of kaolinization differs; quartz, feldspar, and biotite are present.

The thickness of the kaolinized layers reaches 12-15 m, especially in the central and southern parts of the deposit. In the northwest, the crust is partially eroded, where granites and Proterozoic rocks emerge to the surface. The southern and eastern sections are complicated by re-deposited Cenomanian sandy-clayey rocks and conglomerates.

Geomorphologically, the territory is a slightly hilly plain with a south-eastern slope. Erosion forms have developed here - ancient channels and furrows that erode the kaolin thickness and form zones of secondary accumulation. Faults with an amplitude of up to 40 m play a dual role: they simultaneously contribute to the development of kaolinization and complicate the geological structure.

Thus, the geological structure of the "Altyntau" deposit is mosaic in nature, reflecting the interaction of the ancient foundation, granitoid magmatism, weathering crust, and covering sediments. This necessitates the heterogeneity of kaolin mineralization placement, variation in raw

material quality, and the need for detailed geological-structural studies when assessing reserves [4-5].

Litological characteristic

Within the deposit, several lithological complexes are distinguished:

Metamorphic rocks of the Proterozoic – quartzites, siliceous schists, fillite-like argillites; they form tectonic contacts with granites and are characterized by high density, the presence of iron veins and sulfides (pyrite, marcasite).

Paleozoic granitoids – biotite-muscovite granites of light pink and grey-greenish color, products of the third phase of granitoid magmatism of late carbon - early perm; it is on them that the main zone of kaolinization is developed.

Prehistoric age of weathering crust – the main industrial facility with vertical zonality.

Cenomanian sandy-clayey deposits – erosion furrows are made, the kaolin thickness is covered.

Quaternary covers – are represented by modern deposits that partially remove and redistribute kaolin material.

Thus, the geological structure of the "Altyntau" deposit is mosaic in nature, reflecting the interaction of the ancient foundation, granitoid magmatism, weathering crust, and covering sediments. Such a complex structure has led to the formation of heterogeneous in composition and thickness kaolinized layers, which directly affects the quality and industrial value of raw materials. The presence of tectonic faults and erosional forms further complicates the deposit's morphology, creating both favorable kaolin accumulation zones and areas with their destruction. All this determines the need for detailed geological-structural, mineralogical, and geochemical studies to obtain a reliable assessment of reserves and their rational development [6-7-8-9].

CONCLUSION

The "Altyntau" kaolin clays deposit is an important geological and industrial object, characterized by its complex structure, diverse lithological complexes, and high industrial potential. Conducted research shows:

Kaolinization is developed mainly on Late Paleozoic granites and is distinguished by a pronounced zonality;

The thickness of the useful layer reaches 12-15 m, the quality and composition of the raw material vary depending on the degree of preservation of the weathering crust and geological conditions;

chemical analysis confirms the industrial value of kaolins, which have a high content of **SiO_2** and **Al_2O_3** making them suitable for use in ceramic, refractory, and other industries;

the presence of erosion processes, tectonic disruptions, and re-deposited layers requires a comprehensive approach to further study and development.

Thus, the "Altyntau" deposit can become a promising raw material base for various industries of Uzbekistan, provided that it is rationally developed and detailed structural-geological studies are carried out.

SYNTHESIS OF NITROGEN-CONTAINING ACRYLIC MONOMERS

Tadjieva Sh.[1], Maksumova A.[1], Tadjieva G.[2].
[1]*Tashkent Institute of Chemical Technology*
[2]*Tashkent State Technical University named after Islam Karimov*

Summary: *This study describes the synthesis and characterization of a new nitrogen-containing heterocyclic monomer based on the alkylation reaction between benzotriazole and acrylic acid. Optimal synthesis conditions were established at a 1:1 molar ratio of reagents, 80 °C, and 5 hours of reaction time, yielding up to 80% of the target product. The structure of the synthesized monomer was confirmed by FT-IR spectroscopy, which revealed characteristic absorption bands corresponding to C=O, C=C, N=N, and C–N functional groups. Thermal analysis demonstrated that the monomer exhibits a well-defined melting point and thermal stability up to 250 °C, followed by major decomposition near 280 °C. The obtained benzotriazole–acrylic monomer shows good solubility in polar organic solvents. These findings indicate that benzotriazole derivatives can be effectively functionalized through acrylic acid incorporation to create new monomers with promising properties for advanced polymeric materials.*

Key words: *benzotriazole, acrylic monomer, heterocyclic compounds, FT-IR, thermal analysis, synthesis.*

Introduction

Nitrogen-containing heterocyclic compounds constitute one of the most structurally diverse and functionally significant classes of organic molecules [1]. Their characteristic feature is the incorporation of nitrogen atoms into the ring system, which imparts unique electronic, coordination, and reactive properties [2]. Among this broad family, benzotriazole and its derivatives occupy a special place due to their wide range of applications. These compounds are frequently employed as anticorrosive additives, detergents, anti-fog and anti-valent agents in photographic processes, antifreeze components, optical brighteners for various materials, and UV absorbers in cosmetic formulations. In addition, benzotriazole-based molecules have demonstrated considerable pharmaceutical relevance, functioning as biologically active agents with anticancer, antiviral, antibacterial, antifungal, antioxidant, antihypertensive, and anticoagulant activities [3].

Growing interest in nitrogen-containing monomers is associated with their capacity to expand research directions in polymer chemistry, supramolecular chemistry, medicinal chemistry, and molecular biology [4]. Heterocyclic systems containing both azole fragments and amide or lactam functionalities are particularly noteworthy [5]. Their structural similarity to peptide fragments—due to the presence of amide bonds—makes them valuable model compounds for studying biochemical processes occurring in living organisms [6]. Consequently, benzotriazole derivatives attract attention not only as functional organic molecules but also as key intermediates for the design of advanced polymeric and biologically active materials [7].

In our previous studies, several benzotriazole and benzimidazole derivatives were synthesized, including 1-octyl-1,3-dibutyl-1H-benzotriazole, 1-butyl-3-octyl-1H-benzotriazole, 1,3-dioctyl-1H-benzotriazole, 1,3-dibutyl-1H-benzotriazole, and 1-octyl-1H-benzimidazole [8]. A comparative assessment showed that using acetonitrile as the reaction medium resulted in relatively low product yields, whereas the DMF/KOH system significantly increased the yield, reaching up to 92%. Notably, quaternary benzotriazole derivatives were not formed in pure acetonitrile, while they were readily synthesized under DMF/KOH conditions. The molecular structures of the obtained compounds were confirmed by NMR, GC–MS, and FTIR spectroscopy [9].

Further developments in this field have focused on the synthesis of water-soluble diallyl monomers [10]. One such compound, N, N-diallylbenzotriazolium bromide, was synthesized via an alkylation reaction between benzotriazole and allyl bromide at 50–60 °C in various organic solvents, including acetone, ethanol, and toluene. Structural confirmation of the resulting quaternary

ammonium salt was achieved by UV and NMR spectroscopy, while its thermal stability and degradation behavior were investigated using thermoanalytical methods [11].

Recently, more structurally sophisticated benzotriazole-based systems have also been reported [12]. For example, the compound bis(3-(2H-benzo[d] [1,2,3] triazol-2-yl)-2-(prop-2-yn-1-yloxy)-5-(2,4,4-trimethylpentan-2-yl) phenyl) methane (TAJ1) was synthesized via the reaction of 6,6′-methylenebis (benzotriazolyl phenol), propargyl bromide, and potassium carbonate. The structure of TAJ1 was confirmed through FTIR, ^{1}H-NMR, ^{13}C-NMR, and single-crystal X-ray analysis, which revealed a molecular architecture consisting of two benzotriazole-containing aromatic systems linked by a central methylene bridge. Biological evaluation of TAJ1 demonstrated significant inhibitory effects on several cell lines, including HeLa, MCF-7, and Vero cells. Furthermore, DFT analysis provided insights into electronic structure and reactivity, showing a HOMO–LUMO energy gap of 0.159 eV, indicative of high chemical activity [13].

Another important development is the synthesis of the monomer 2-(bis((1H-benzo[d][1,2,3] triazol-1-yl) methylamino) ethyl acrylate) (BMEA), which contains two pendant benzotriazole fragments [14]. Polymerization of this monomer afforded PBMEA, a new material exhibiting high hygroscopicity and potential applicability in humidity-responsive systems and functional membranes.

Benzotriazole derivatives are also known to form stable complexes with various transition metals, a property that has been exploited in catalysis, coordination chemistry, and materials science [15]. Coordination of benzotriazole with certain metal ions has been linked to enhanced anticancer activity, thereby broadening its therapeutic potential [16]. Additionally, benzotriazole can serve as a radical precursor [17] or as a synthon for generating stable nitrenium ions [18], further highlighting its versatility in synthetic organic chemistry.

Taken together, the literature clearly demonstrates that the synthesis, modification, and study of nitrogen-containing heterocycles—particularly benzotriazole derivatives—are of great scientific and practical relevance [19]. Their broad functional potential makes them promising candidates for applications in polymer science, coordination chemistry, pharmaceuticals, materials engineering, and environmental technologies [20].

Materials and Methods

Materials

The following reagents were used in the study: benzotriazole and acrylic acid, both of which were purified using standard procedures described in the literature.

Purification of benzotriazole was carried out by recrystallization.

Benzotriazole:

- Molecular weight: 119.13 g/mol
- Density (20 °C): 1.36 g/cm³
- Melting point: 100 °C
- Appearance: Colorless needle-shaped crystals
- Solubility: Freely soluble in alcohols, benzene, toluene, and methanol; practically insoluble in water

Acrylic acid (propenic acid, ethenecarboxylic acid), analytical grade, was dried over calcined magnesium sulfate and further purified by vacuum distillation:

- Boiling point: 141 °C
- Density (20 °C): 1.0511 g/cm³

N,N-Dimethylformamide (DMF), chemically pure grade (TU 2636-056-05761637-2005), was dried over barium oxide and purified by vacuum distillation:

- Boiling point: 153 °C
- Melting point: –61 °C
- Density (20 °C): 0.9445 g/cm³
- Refractive index (nD20): 1.43

The synthesized benzotriazolium acrylic acid derivative is a white crystalline compound with:

- Boiling point: 279 °C

Synthesis of benzotriazole monomer with acrylic acid

The synthesis of the target monomer was carried out in an organic solvent medium at 80–90 °C for 3–5 hours. The reaction was performed in a glass reactor consisting of a conical flask equipped with a reflux condenser and a magnetic stirrer.

Benzotriazole (1 mol) was dissolved in 100 mL of dimethylformamide. The reaction mixture was stirred at room temperature for 5 minutes. Acrylic acid (1 mol), previously stabilized with 0.2 g of hydroquinone to prevent premature polymerization, was added dropwise to the solution. The reaction mixture was then heated to 80 °C and maintained with continuous stirring for 5 hours.

Upon completion, the reaction mixture was cooled to room temperature, resulting in the formation of light-yellow crystalline precipitates. The solid product was isolated by vacuum filtration, thoroughly washed with water, and dried under reduced pressure. Yield: 80%.

Characterization Techniques

FT-IR Spectroscopy

IR spectra were recorded using a Spectrum Two FT-IR spectrometer (PerkinElmer Spectrum IR Version 10.6.1, USA, 2019), equipped with an attenuated total reflection (ATR) MIRacle-10 attachment with a diamond/ZnSe crystal.

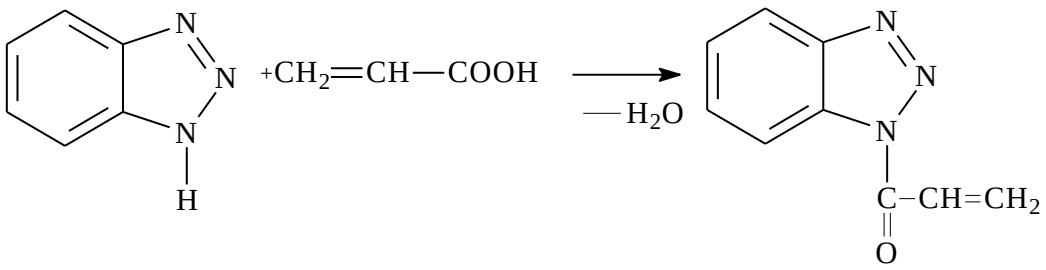
- Spectral range: 4000–400 cm^{-1}
- Resolution: 4 cm^{-1}
- Signal-to-noise ratio: 60,000:1
- Scan speed: 20 scans/s

Thermal Analysis

Thermal behavior of the synthesized samples was analyzed using a Netzsch STA 409 PG (Germany) simultaneous thermal analyzer equipped with a K-type thermocouple (LowRGSilver) and aluminum crucibles.

Experimental conditions:

- Atmosphere: Nitrogen (inert)
- Gas flow: 50 mL/min
- Temperature range: 25–600 °C
- Heating rate: 5 K/min
- Sample mass: 5–10 mg



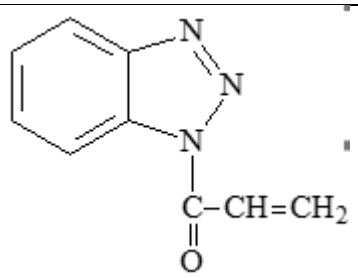
The system was calibrated using standard reference materials: KNO_3, In, Bi, Sn, and Zn.

Melting Point and Chromatographic Purity

The melting point of the synthesized monomer was determined using a Boetius heating stage (Germany). Reaction progress and product purity were monitored by thin-layer chromatography (TLC) using Silufol UV-254 plates with a benzene–ethanol (3:1) mobile phase.

Results and Discussion

This study presents the results obtained during the synthesis and characterization of a nitrogen-containing heterocyclic monomer derived from benzotriazole and acrylic acid. The target compound represents a benzotriazole-based acrylic acid derivative containing a quaternized nitrogen fragment, which is of considerable interest for the development of functional monomers and advanced polymeric materials. The proposed structure of the synthesized monomer is illustrated schematically below.



The synthesized monomer demonstrated excellent solubility in polar organic solvents, which is an important prerequisite for its potential application in polymerization processes and for its

incorporation into copolymer matrices. The principal physicochemical properties of the product are summarized in Table 1.

Table 1.

Physical and chemical characteristics of DABTB

Formula of the synthesized compound	Gross formula	Aggregate state	Mol. weight	T_{boil} °C	Solubility
	$C_9H_7N_3O$	white crystal	173	279	dimethylformamide, ethanol, acetone

To establish the most efficient synthesis conditions, the effects of reaction temperature, duration, and molar ratios of the reactants were systematically investigated. A comparative assessment revealed that the most favorable conditions correspond to a 1:1 molar ratio of benzotriazole to acrylic acid, a reaction temperature of 80 °C, and a reaction duration of 5 hours. Under these parameters, the highest yield and product purity were achieved. At lower temperatures or shorter reaction times, incomplete conversion was observed, whereas higher temperatures promoted undesired side processes, including partial polymerization of acrylic acid despite the presence of a polymerization inhibitor.

IR Spectral Analysis

Structural identification of the synthesized monomer was confirmed by FT-IR spectroscopy (Fig. 1).

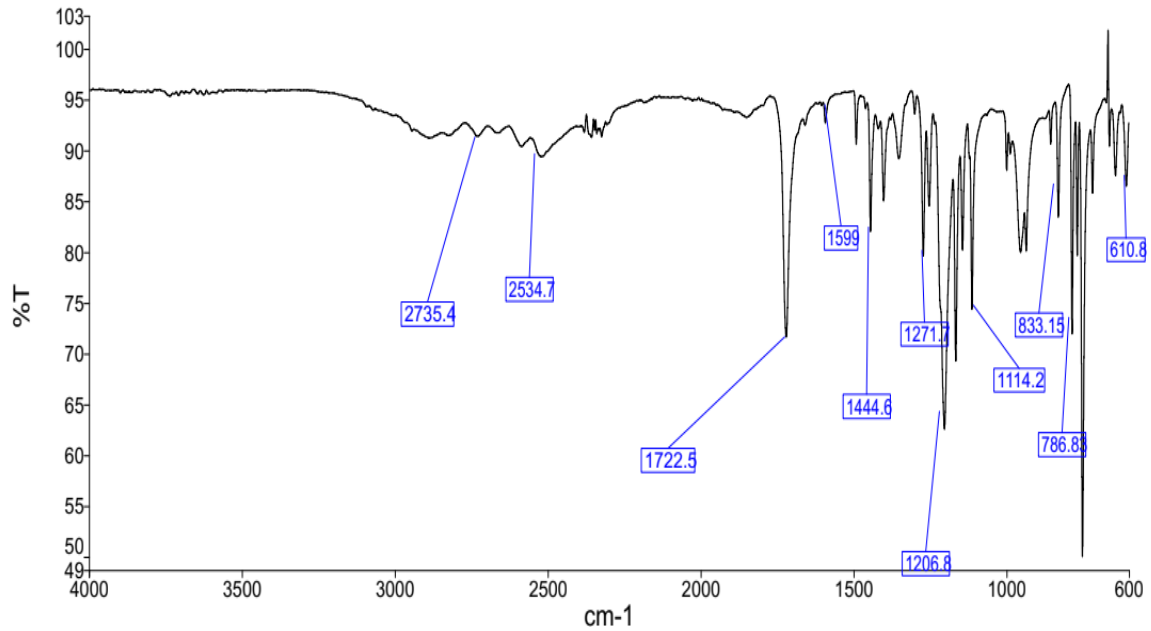


Figure 1. IR spectrum of benzotriazole monomer with acrylic acid

The IR spectrum of the obtained BTAA monomer exhibits several distinct absorption bands corresponding to the functional groups involved in the structure. A strong absorption band at 1720 cm^{-1}, attributed to the C=O stretching vibration of the acrylic acid fragment, confirming successful incorporation of the carbonyl group. A characteristic band at 1457 cm^{-1} corresponds to the –N=N– vibrations of the benzotriazole ring. The vinyl group displays a typical stretching vibration at 1622 cm^{-1}, assigned to the C=C bond of the acrylic acid moiety. A well-defined band at 1146 cm^{-1} is associated with C–N stretching, indicating the interaction between benzotriazole and acrylic

fragments. The band near 620 cm^{-1} corresponds to N–C=O bending vibrations. These spectral features collectively confirm the formation of the intended benzotriazole-based acrylic monomer and the preservation of key heterocyclic and vinyl functionalities necessary for further polymerization.

Thermal Analysis

Thermogravimetric analysis (TGA) was carried out in order to assess the thermal stability and decomposition behavior of the synthesized monomer (Fig. 2).

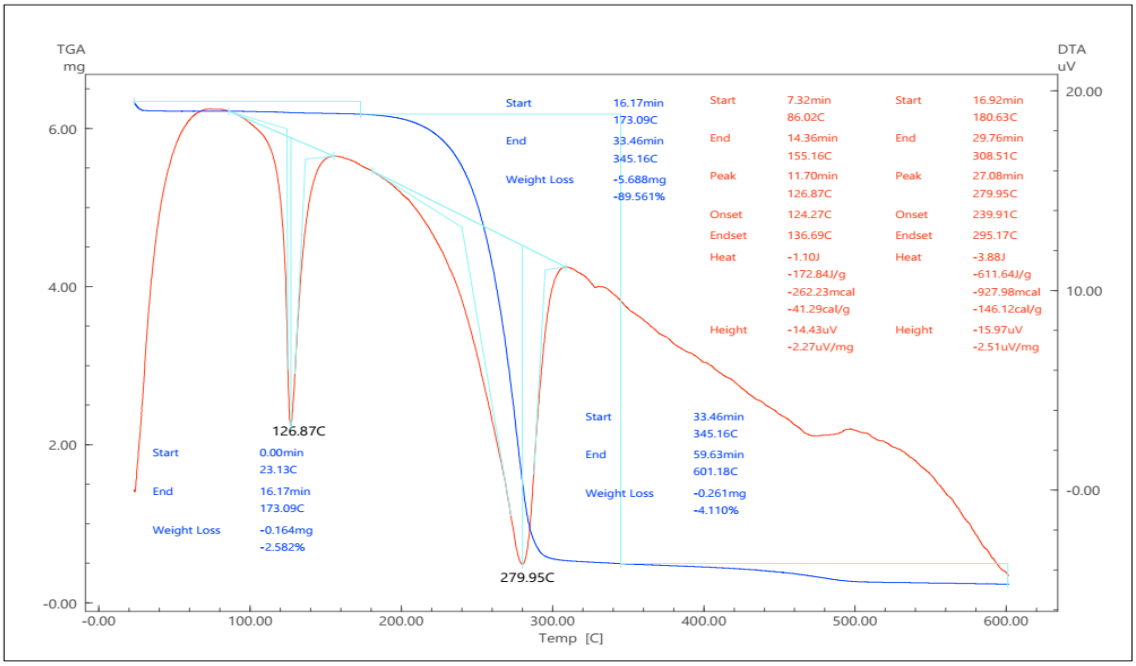

Figure 2. Thermogravimetric analysis of benztriazole monomer with acrylic acid

The TGA data demonstrate that the monomer undergoes thermal decomposition in several stages. A minor mass loss of 2.6% occurs within the temperature range 86–155 °C, which can be attributed to the removal of physically adsorbed moisture or trace amounts of solvent remaining in the crystalline lattice. An endothermic peak observed at 126 °C (ΔQ = –172.84 J/g) corresponds to the melting point of the compound, confirming the thermal data obtained independently.

No significant mass change occurs immediately after melting; however, pronounced thermal decomposition begins at approximately 279.95 °C, which corresponds to the second major stage of degradation. At this stage, a mass loss of 89.56% is observed, indicating complete breakdown of the monomeric structure and the loss of volatile fragments.

The thermal behavior of the monomer indicates good stability up to ~250 °C, making it potentially suitable for polymerization techniques requiring moderate thermal input. The presence of a distinct melting point and clean decomposition profile further supports the purity of the synthesized compound.

Conclusion

In this work, a new nitrogen-containing heterocyclic monomer based on benzotriazole and acrylic acid was successfully synthesized and comprehensively characterized. Optimal reaction conditions were established as a 1:1 molar ratio of benzotriazole to acrylic acid, a reaction temperature of 80 °C, and a synthesis duration of 5 hours, which ensured high yield and purity of the final product. The synthesized monomer was obtained as a white crystalline compound with good solubility in polar organic solvents, making it suitable for further polymerization processes.

Structural identification by FT-IR spectroscopy confirmed the presence of characteristic functional groups, including C=O, C=C, N=N, and C–N vibrations, which verify the successful formation of the benzotriazole–acrylic acid framework. Thermal analysis demonstrated that the monomer possesses a well-defined melting point and remains thermally stable up to approximately

250 °C, with major decomposition occurring near 280 °C. Such behavior indicates that the compound can withstand moderate thermal processing conditions typically required for polymer synthesis.

Overall, the results show that benzotriazole derivatives can be effectively functionalized through acrylic acid incorporation to form monomers with desirable physicochemical and thermal properties. The synthesized monomer represents a promising precursor for the development of new functional polymers and advanced materials. Further studies may focus on polymerization behavior, copolymer synthesis, and evaluation of the resulting materials for potential applications in coatings, membranes, and functional organic systems.

Резюме: *В данном исследование описывает синтез и характеристику нового азотсодержащего гетероциклического мономера на основе реакции алкилирования между бензотриазолом и акриловой кислотой. Оптимальные условия синтеза были установлены при молярном соотношении реагентов 1:1, 80 °C и времени реакции 5 часов, с получением 80% целевого продукта. Структура синтезированного мономера была подтверждена ИК- ТА-спектроскопией, которая выявила характерные полосы поглощения, соответствующие функциональным группам C = O, C = C, N = N и C-N. Термический анализ показал, что*

мономер обладает хорошо выраженной температурой плавления и термостойкостью до 250 °C, после чего происходит крупное разложение около 280 °C. Полученный бензотриазолоакриловый мономер проявляет хорошую растворимость в полярных органических растворителях. Эти результаты показывают, что производные бензотриазола могут быть эффективно использованы путем введения акриловой кислоты для создания новых мономеров с перспективными свойствами для передовых полимерных материалов.

***Rezyume**: Ushbu tadqiqotda benzotriazol va akril kislotaning alkillanish reaksiyasi asosida yangi azot saqlovchi geterotsiklik monomerni sintez qilish va uning xossalarini o‘rganish natijalari keltirilgan. Optimal sintez sharoitlari 1:1 mol nisbatda, 80 °C harorat va 5 soat davomda olib borilganda eng yuqori (80%) unum qayd etilgan. Sintez qilingan monomer tuzilishida C = O, C=C, N=N va C-N funksional guruhlariga mos keladigan o‘ziga xos yutilish chiziqlari aniqlagan va IK-TA- spektroskopiyasi bilan tasdiqlangan. Termaanalitik tahlili monomerning aniq suyuqlanish harorati 250 °C gacha issiqlik barqarorligiga ega ekanligini, 280 °C atrofida esa asosiy parchalanish boshlanishini ko‘rsatdi. Olingan benzotriazol-akril monomeri qutbli organik erituvchilarda yaxshi eruvchanlikka ega. Tadqiqot natijalari benzotriazol hosilalarini akril kislota orqali samarali funksionallashtirish orqali istiqbolli yangi monomerlar olish mumkinligini tasdiqlaydi.*

SYNTHESIS AND PROPERTIES OF COMPLEX ESTERS BASED ON BIOLOGICALLY DECOMPOSED DICARBONIC ACIDS

Matkarimova N., Maksumova O.
Tashkent Institute of Chemical Technology

Summary: *This research work is aimed at the synthesis of new esters based on tartaric acid and acrylic acid, which are considered biobase polycarboxylic acids. The esterification process was carried out at a temperature of 80 °C in the presence of a KU-2-8 ion exchange resin (H-form), which is easily extracted from the reaction medium as a catalyst and has extensive processing capabilities. Acrylic acid and tartaric acid were prepared in a 2:1 ratio. To prevent the polymerization process due to acrylic acid, hydroquinone was used as an inhibitor in the production of ether. The synthesized ether is believed to serve as a monomer for the preparation of a dental filling. As a result of the reaction, the ester yield was 86%. Ether purification was confirmed by high performance liquid chromatography and IR spectroscopy. Ether bands appeared in the IR spectrum, and the results were confirmed by high performance liquid chromatography and showed high purity and efficient formation of the resulting product.*

The synthesized new monomer ether serves as a promising raw material for copolymerization processes, the production of promising bioassisted monomers, in the field of dentistry.

Key words: *Tartaric acid, acrylic acid, ester, ion-exchange resin, KU-2-8, bio-basic monomer, esterification reaction, renewable raw materials*

Introduction

Currently, special attention is paid to obtaining environmentally friendly substances with high added value from biobasic monomers. Tartaric acid produced microbiologically from natural sources is considered one such promising dicarboxylic acid. Its presence of two carboxyl groups and two hydroxyl groups allows it to participate in various reactions, including serving as a valuable monomer for the synthesis of esters. In this regard, synthesized esters based on tartaric acid are of great importance in the development of environmentally friendly polymers and special additives obtained from renewable raw materials. The production of tartaric acid from natural sources is of great ecological and economic importance. This acid is mainly extracted from the waste of viticulture and winemaking, in particular from wine stones (potassium tartrate crystals).

This approach allows the use of renewable raw materials and contributes to the development of waste-free technologies [1]. Also of great practical importance are tartaric acid-based ester compounds, which are widely used in the synthesis of biodegradable polymers, plasticizers and biocompatible monomers. Synthesis of tartaric acid esters from a natural source is even more environmentally beneficial because the process reduces the need for artificial catalysts, reduces waste, and produces safe and stable products for use in biomedical and green chemistry. [2].

As a result, the production of tartaric acid and its esters from natural sources, along with the creation of biological raw materials that comply with the principles of sustainable development, will make a significant contribution to the preservation of the environment and the effective use of renewable resources [3].

Acrylic acid is currently considered one of the main monomers for the polymer industry and is highly reactive. It is particularly important to produce esters while maintaining the double bond. In this regard, the synthesis of esters based on tartaric and acrylic acids makes it possible to combine two types of promising monomers. This makes it possible to impart new functional properties to the materials obtained from them [4]. Esterification reactions are one of the important areas of organic synthesis and are widely used on an industrial scale for the production of various esters [5]. Tartaric and acrylic acid and their esters are characterized by high reactivity, the presence of secondary functional groups and versatility in polymerization processes [6]. In particular, tartaric acid obtained

by biosynthesis is of great importance as an environmentally friendly and renewable raw material [7-9]. The proposed synthesis method enables efficient use of renewable natural resources, ensuring environmental and economic feasibility of the process. The preservation of double bonds in the structure of the obtained ethers gives them a high reactivity and opens up wide opportunities for subsequent polymerization and functionalization. Due to this, such compounds can be considered as an environmentally safe and sustainable alternative to traditional petrochemical esters, which makes them promising components for creating new bio-based polymer and functional materials. [10].

Traditionally, such reactions have been carried out in the presence of homogeneous acid catalysts (H2SO4, H3PO4, etc.), but their susceptibility to corrosion, waste generation and difficulty in reuse cause great problems [11-12]. Therefore, in recent years, there has been a growing interest in the use of heterogeneous ion exchange resin catalysts (KU-2-8, Dowex, etc.). The use of ion exchange catalysts (KU-2-8, Amberlyst, Dowex, DIAION, etc.) makes it easy to recover and reuse the catalyst by filtration after the reaction [13]. In general, ionite catalysts are widely studied in esterification reactions - they are studied from the point of view of reaction kinetics, mass conductivity limitations and reactor design [14].

Earlier, E. Sert and colleagues investigated the kinetic patterns of the esterification reaction in the acrylic acid-alcohol system in the presence of an ionite catalyst, showing the effect of temperature and catalyst concentration on the rate and degree of conversion [15]. In turn, A. D. Buluklu et al developed a kinetic model of the mechanism of esterification of acrylic acid with hexanol, which made it possible to quantitatively describe the effect of process parameters on the yield of the target product [16]. The authors studied the esterification of tartaric acid with various alcohols using modified heterogeneous catalysts (SO ′ ² ′/TiO ′ -SiO ′, lanthanide-based catalysts) and successfully synthesized a number of diesters - dimethyl, dibutyl and di-isooctyl - with high yield and selectivity. [17]. There are also patent data on tartaric acid esters. Analysis of the literature shows that the synthesis of acrylic acid esters and alcohols in some cases is very well studied, but there is not enough information in the literature about esterification methods with the addition of tartaric acid and acrylic acid. Thus, this research work contributes to solving a number of scientific problems, and the results obtained serve as an important source of information for the synthesis of polymer materials, functional monomers and new ether additives.

The aim of the work is to synthesize esters based on tartaric acid, which is a renewable natural source, and highly reactive acrylic acid in the presence of an H-form KU-2-8 ion-exchange catalyst, optimize reaction conditions and substantiate the value of the obtained products as promising monomers.

Materials and Methods

Materials

The following objects of research were selected: benzotriazole, acrylic acid, which were purified according to known methods.

Tartaric acid (tartaric acid, $C_4H_6O_6$, brand "x.h") - (tartaric acid, tartaric acid, 2,3-dihydroxybutanedioic acid) HOOC-CH (OH) -CH (OH) -COOH was purified by recrystallization in distilled water. Liquid. = 168-170 °C; ρ = 1.76 g/cm3; solubility in water = 1390 g/l (20 °C).

Acrylic acid (propenoic acid, ethenecarboxylic acid) CH_2=CH−COOH of the "x.h" brand was dried over calcined magnesium sulfate and purified by distillation in vacuo.: Type = 141 °C; ρ = 1.0511 g/cm3.

Hydroquinone ($C_6H_6O_2$, brands "x.h") was used as an inhibitor in an amount of 0.1% to preserve the double bond of acrylic acid. Mf = 170 °C; Boiling point = 285 °C.

Catalyst - KU-2-8 (H-form) - acid ion-exchange resin. Before the reaction, it was dried at 110 °C for 12 hours. The density ≈ 1.27 g/cm3.

Ester Preparation Procedure The ether preparation process was carried out in a 250 ml round bottom flask equipped with a magnetic stirrer, reflux condenser and Dean-Stark apparatus. Tartaric acid and acrylic acid are taken in molar ratio 2:1. Ion exchange resin KU-2-8 (H-form) was used as the catalyst. The catalyst was added in an amount of 10% by weight based on the total weight of the reaction mixture. The reaction temperature was maintained at 80 ± 2 °C, and the reaction mixture was

constantly stirred. The release of water during the reaction was collected using a Dean-Stark device, which shifted the reaction to the left of equilibrium and increased the ether yield. To maintain the double bond of acrylic acid, 0.1% hydroquinone inhibitor was added to the reaction mixture. After completion of the reaction, the ether formed was separated from the catalyst by filtration at the end of the reaction.

HPLC was performed on an Agilent 1260 Infinity II (USA) chromatograph. Chromatographic analysis conditions: column - Poroshell 120 EC-C18, 4 μm, 4.6 × 150 mm, detector - diode-matrix, eluent - acetonitrile: water (50:50), flow rate - 1 mL/min, detection wavelength - 246 nm, column volume - 5 μL, thermostat temperature - 30 0C, analysis time - 5 min.

IR spectra were recorded on a Spectrum two FT-IR Spectrometr spectrometer (PerkinElmer Spectrum IR Version 10.6.1, USA, 2019) complete with a MIRacle-10 distorted total internal reflection (IRR) prefix with a diamond prism/ZnSe (spectral range on the wavenumber scale - 4000 ÷ 400 cm-1; resolution 4 cm-1, signal-to-noise ratio - 60,000: 1; scanning speed - 20 spectra per second).

Results and Discussion

This study presents the results obtained from the synthesis and description of an ester derived from tartaric acid and acrylic acid. The target compound is a tartaric acid derivative containing a biobasic acid of great interest for the development of functional monomers and modern polymer materials. The structure of the synthesized ether is shown schematically below.

$$2CH_2=CH–COOH+C_4H_6O_6 \rightarrow C_{10}H_{12}O_8+2H_2O$$

The physicochemical data of the synthesized Vino-bis (acrylate) ester are shown in the following table.

Table-1

Properties of synthesized Vino-bis (acrylate) ether

№	Formula of the synthesized compound	Gross formula	Aggregate state	Mol. weight	d^{20}_4, г/sm^3	Solubility	Density g/cm ^{3}
1	$CH_2=CH–COO–CHOH–CHOH–OOC–CH=CH_2$	$C_{10}H_{10}O_8$	Colorless light yellow, liquid	258	1,46-1,47	Insoluble in water, (ethanol, acetone, chloroform, highly soluble	1.28 г/см^3

The purity of the synthesized product was determined using an Agilent 1260 infinity II (USA) liquid chromatograph.

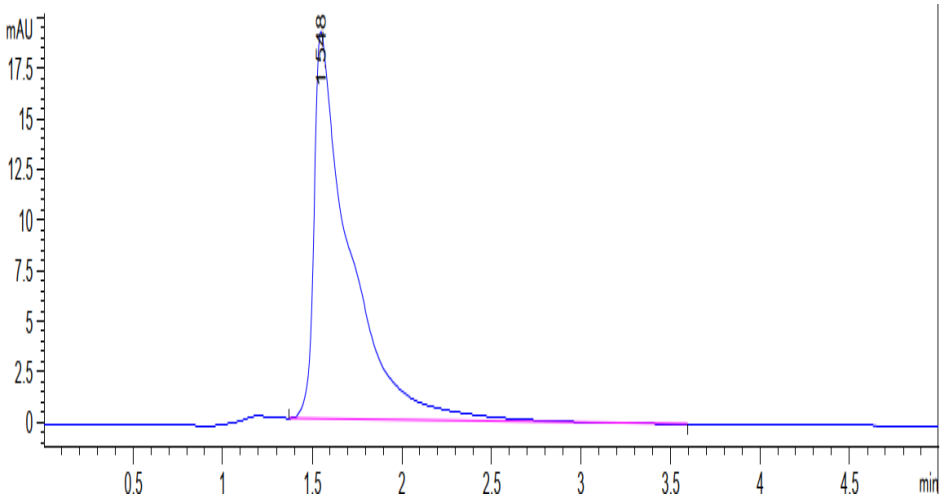

Figure 1. HPLC Chromatogram of Synthesized Ether Wine Bis (Acrylate)

According to the results of the obtained chromatographic image in (Figure 1) for 1.548 minutes, the peak gave only one product, which confirms that the product is free of impurities and has a high degree of purity. Also, in order to confirm the structure of the synthesized ether, the obtained sample was analyzed by infrared spectroscopy (Fig.2).

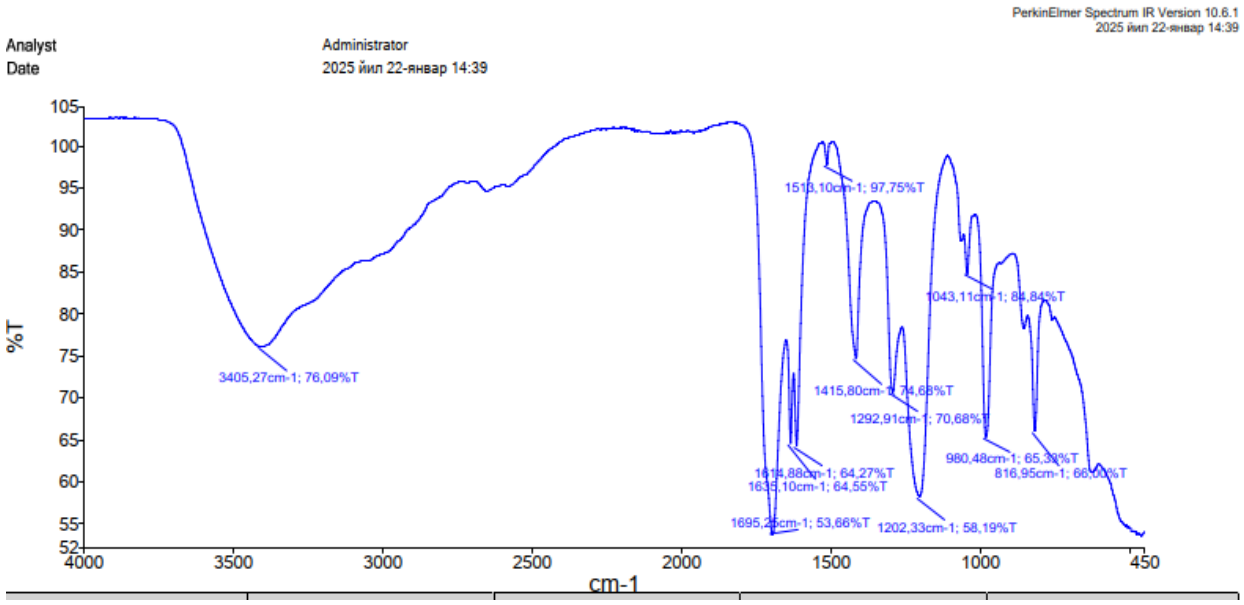

Figure 2. IR spectrum of synthesized ether Wine bis (acrylate)

As can be seen from the figure, in the IR spectrum of the synthesized Vino bis (acrylate) ester, absorption bands are observed at 3405 cm $^{-1}$ corresponds to the valence fluctuations of hydroxyl groups (-OH) in the composition of carboxyl fragments (-COOH), which indicates the presence of a small amount of unreacted carboxylic acid. The intense band at 1695 cm $^{-1}$ refers to the valence fluctuations of the carbonyl groups (C = O) and indicates the formation of an ether structure as a result of the esterification reaction. Characteristic bands in the region of 1638 cm $^{-1}$ are associated with valence fluctuations of C = C (α, β - unsaturated double bonds, which confirms the preservation of unsaturated acrylate fragments in the molecular structure of the synthesized compound. capable of subsequently entering into polymerization reactions. In addition, in the region of 1292-1202 cm $^{-1}$, new pronounced bands corresponding to the valence fluctuations of C-O-C bonds are observed, which is a direct confirmation of the successful progress of the esterification reaction between carboxylic and acrylic acids.

Conclusion

Thus, the synthesis process of a new biobasic ester based on tartaric and acrylic acids was investigated. The esterification reaction in the presence of ion-exchange catalyst KU-2-8 (in H-form) at a temperature of 80 ± 2 °C and a molar ratio of 2:1 proceeded in high yield (up to 89%). The use of a hydroquinone inhibitor ensured the retention of double bonds of acrylic acid, which allows the resulting product to participate in further polymerization processes. IR spectroscopic analysis confirmed the successful progress of the esterification reaction: the characteristic absorption bands of tartaric acid carboxyl groups (1700-1720 cm $^{-1}$) disappeared, and bands corresponding to ether groups (1695 cm $^{-1}$) appeared in their place. The presence of a strip at 1638 cm $^{-1}$ indicates the preservation of double bonds of acrylate fragments. Chromatographic analysis showed a high degree of purity (≥ 98%) and reaction efficiency. The obtained tartaric acid bis (acrylate) combines functional carboxylic and vinyl groups, which provide both chemical activity and polymerizability.

EFFECTIVENESS OF BENTONITE-POLYMER COMPOSITIONS FOR FIXING MOBILE SANDS OF THE MUYNAK DEPOSIT

Ismailov B.M.
Karakalpak State University named after Berdakh
E-mail: bahtiyar.ismailov@mail.ru

Summary: *The article examines methods for stabilizing the mobile sands of the Moynak deposit using polymer-mineral compositions based on bentonite clay and water-soluble polymers. The relevance of the research is explained by the prevention of dust and sand particles from rising into the atmosphere and the creation of favorable conditions for plant growth.*

Experimental data on the study of the penetration kinetics of fixing suspensions and the change in the plastic strength of sandy soils at different concentrations of bentonite and polyacrylamide are presented. The mechanisms of adsorption interaction between the components of the mixture and sand particles, which determine the processes of structure formation and strengthening of the porous space, have been revealed. It has been established that the use of bentonite-polymer compositions contributes to the formation of a strong surface crust, a decrease in the penetration depth of the cone, and a long-term fixation of the upper layers of the sand system. The obtained results confirm the prospects of using these compositions for environmentally safe reclamation of shifting sands and preventing their further migration.

Key words: *bentonite clay; water-soluble polymers; polyacrylamide; carboxymethylcellulose; stabilization of mobile sands; structure formation; plastic strength; land reclamation; sandy soils; polymer-mineral compositions.*

INTRODUCTION

One of the most significant environmental challenges of our time is to prevent land degradation and reduce the rate of desertification, which is accompanied by the migration of shifting sands, deflation, and deterioration of natural ecosystems. Mobile sand massifs pose a serious threat to infrastructure, agricultural lands, and atmospheric quality due to intensive dust formation and destruction of the surface soil layer. In this regard, technologies aimed at stabilizing sandy soils and increasing their resistance to wind erosion are of particular relevance. [1-2]

The application of polymer-mineral compositions based on bentonite clay and water-soluble polymers for stabilizing mobile sands is of particular interest. This approach combines the availability of raw materials, environmental safety, and high efficiency in creating surface structures capable of resisting deflationary processes. Bentonite, possessing a developed surface and high sorption capacity, in combination with polymer components forms stable coagulation-adsorption structures that ensure the long-term strengthening of the sandy environment. [3-6]

An additional advantage of these compositions is their integration with erosion control and phytomelioration measures aimed at restoring disturbed lands. The use of strengthening suspensions contributes to the reduction of dust removal, improvement of plant stabilization conditions, and the formation of more stable landscapes in arid territories. [7-12]

The presented work is devoted to the study of the structure-forming properties of bentonite-polymer mixtures, the analysis of their penetration into the porous space of sands, and the assessment of changes in the plastic strength of the soil at various concentrations of components. The obtained results allow substantiating the effectiveness of the developed compositions and determining their potential for practical application in the melioration of shifting sands.

II. RESEARCH MATERIALS AND METHODS

As the main polymer component in the study, a widely known synthetic flocculant - polyacrylamide (PAA) - was used, which is characterized by low toxicity, availability, and high efficiency in the processes of flocculation and structuring of dispersed systems. The applied hydrolyzed PAA had a molecular mass of Mo = 2000 kDa and a hydrolysis degree of at least 60%. Additionally, KMS-700 grade carboxymethylcellulose was used as a modifying component. The

mineral component of the strengthening compositions was represented by bentonite clay, which has high sorption activity and significant ion exchange capacity.

To determine the optimal composition of the strengthening mixture, compositions containing 1-5% bentonite and 0.1-2% water-soluble polymers were prepared. The mixtures were varied in the ratio of components to determine the influence of bentonite and PAA concentrations on the structure formation processes in the sandy environment. The experimental part of the study included the analysis of the penetration kinetics of the strengthening suspensions and the determination of the plastic strength of the modeled sand samples. The sand from the Moynak deposit, pre-dried and fractionated, was used as the initial material.

The kinetics of fluid penetration and the dynamics of strength characteristics change were determined by the plastic strength value using the cone immersion method using a Geppler consistometer. This device ensures the recording of changes in the material's plastic resistance over time and allows for research under various temperature conditions, which is an important factor in the analysis of structure-forming processes.

The applied experimental methods made it possible to comprehensively assess the adsorption interactions between the polymer, bentonite, and sand particles, as well as to establish the influence of concentration factors on the effectiveness of structure formation in the reinforced sand environment.

III. EXPERIMENT RESULTS

The results presented in the article demonstrate that the development and application of binding compositions based on bentonite clays and water-soluble polymers (VP) have significant potential for solving a number of environmental problems.

To study changes in sand surface strength, the following experiments were conducted: initially, a metal beaker with a diameter of 50 mm and a height of 15 mm was used, and dried sand was placed in it. Before conducting the research, the sand was separated into fractions, and a fraction with a size of 0.3-0.5 mm was selected for the research.

The sand in the beaker was tightly compacted and then impregnated with liquids containing the considered stabilizers, in volumes from 100 to 200 ml per 1 kg of sand. The fastening capacity and penetration kinetics were investigated by analyzing changes in plastic strength using a Geppler consistometer. This consistometer allows studying processes at different temperatures, which is an important factor in this research.

Analysis of the kinetics of fixing processes using various sand samples and changes in their plastic strength showed that the penetration conditions of the fixer with the formation of free flow in space under the influence of gravitational or capillary forces depend on the type of binder agent and the composition of the sand itself.

The analysis of the influence of the fixing mixture composition allowed us to determine the most suitable options for our research. In Table. Table 1 presents the compositions of these variants.

Table 1.

Percentage content of components in the fixing mixture, %

Components	Mixture sample, №					
	1	2	3	4	5	6
Bentonite	3,0	3,0	3,0	5,0	5,0	5,0
PAA	1,0	0,5	0,3	1,0	0,5	0,3

Figure 1 shows data characterizing the changes in the volume of penetration of PAA-containing bentonite suspension into the sand system of the Muynak deposit. The volume of the suspension on the surface of 15 cm^2 of sand (with a total mass of 50 g) was 6 ml.

Plastic strength reflects the resistance of the initial structure formed during the transformation of unstructured sand into its structured forms. Under the influence of the fixing additive, two characteristic areas are observed on the curves of change in the plastic strength of sands over time: the structure formation period and the hardening period. As the diagrams show, the duration of these periods depends on the type of liquid used.

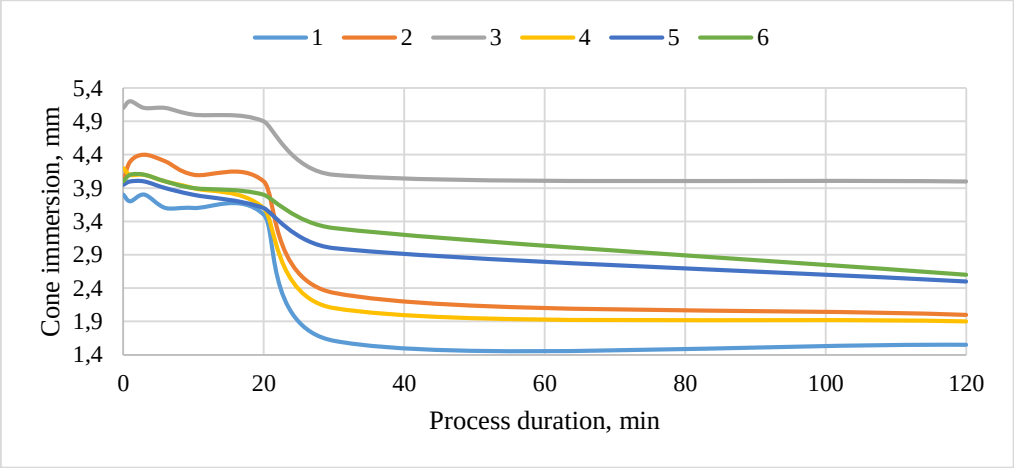

Fig. 1. Time-dependent cone subsidence dynamics for sand samples: Moynak deposit.

The influence of bentonite suspension penetration is determined by several main parameters, including channel sizes and the interaction of the sand particle surface with the liquid. Analysis of the data presented in Figure 1 shows that after the impregnation process, an increase in the cone immersion depth is observed within the next 20-30 minutes. As can be seen from the results, the penetration height is lower when the polymer is present in the mixture in a volume of 1%. With a decrease in the PAA content (1% to 0.3%, while maintaining 3% bentonite), an increase in the initial cone immersion depth from 3.85 to 5.2 mm is observed, which indicates a decrease in the plastic strength of the sand system with a decrease in the % content of the polymer.

If, at the initial moment of impregnation of the 1st composition, the cone is submerged by 3.95 mm, then during the first 20 minutes, an increase in the submersion height to 4.1 mm is observed. However, after 20-22 minutes, a sharp decrease in diving height occurs. Further reduction in penetration depth is explained by the strengthening of the sand system due to structure formation and partial transition of the formed coagulation structures to crystalline forms.

The results of studying the composition of impregnated sands indicate that the main amount of bentonite suspension is retained in the upper layer at the very beginning of the impregnation process. This delay increases with increasing suspension viscosity, i.e., with increasing polymer concentration. The decrease in the amount of suspension as it moves deeper is likely explained by the formation of a film at the contact boundary of the liquid with the sand particle surface. Under the pressure of the remaining liquid, this film breaks. However, upon interaction with subsequent layers of the impregnated liquid, a new film is observed.

The study of changes in the plastic strength of impregnated sands showed that the film formation and rupture process is observed within the first hour. The breaking films are trapped between the sand particles, gradually filling and sealing the gaps.

Sand compaction should be observed when impregnating any liquid, including water. In the case of using water, it can be concluded that the smallest particles are washed away, which leads to an increase in porosity. However, as shown by the results of impregnation with 6 ml of water, the cone immersion height at the initial moment is 6.11 mm, which is significantly higher than the values obtained with the studied compositions. This indicates an increase in the strength of impregnated sands, which is due not only to mechanical compaction but mainly to the interaction of the sand particle surface with the components of the strengthening additive. As previously noted, the interaction of liquid components with the channel surface leads to a change in the liquid flow through the system channels and their clogging, which prevents further movement of the liquid flow.

Perhaps, the increase in the penetration depth of the cone at the initial moment of impregnation can be attributed to the expansion of the initial impregnation due to mechanical factors, such as the loosening of sands due to the filtration of the liquid and the removal of the smallest particles. However, this situation is not observed for the 6-component system. If at the initial moment, a slight increase in strength can be observed, then after 20-25 minutes, a sharp decrease in the immersion

height (3.8 to 2.5 mm) is observed. It is likely that in this case, the pores are blocked by a large amount of bentonite in the suspension.

Increasing the concentration of bentonite does not necessarily affect the change in cone immersion, which is also affected by the composition of the sand itself. Based on the data related to the change in the plastic strength of the sand crust of the Muynak deposit after 2 hours, it is possible to establish the sequence of structure-forming compositions in the following order: 1>4>2>5>6>3.

However, after a day of holding, the plastic strength of all sand samples significantly decreases. The decrease in the impregnation depth over time can be explained by the increase in the strength of these systems due to the structure formation and partial transformation of the formed coagulation structures into crystalline forms.

IV. CONCLUSION

Based on the conducted research, it has been established that the use of strengthening compositions based on bentonite clays and water-soluble polymers is a promising method for stabilizing mobile sands. Experimental data showed that the introduction of polymer-mineral suspensions ensures the formation of a stable structure of the sand material, which is confirmed by an increase in plastic strength and a decrease in the cone immersion depth after the initial impregnation period.

Analysis of the penetration kinetics of the strengthening solutions revealed the dependence of the strengthening efficiency on the concentration of bentonite and polymer, as well as on the morphological properties of the sand. It has been shown that an increase in the polymer content contributes to an increase in the suspension's viscosity and an increase in structure-forming processes, while a decrease in its concentration leads to a decrease in the plastic strength of the sand system. The adsorption interaction mechanism between the mixture components and the sand particle surface plays a significant role, ensuring the formation of coagulation-crystalline structures that stabilize the pore space.

It has been established that the majority of the bentonite suspension accumulates in the upper layer of the sand, where film formation and rupture occur sequentially, partially blocking the pores and contributing to an increase in the strength of the structure within the first hour. Further reduction of the cone penetration depth indicates compaction and fixation processes, which confirms the effectiveness of the proposed compositions compared to the control (water impregnation).

The obtained results allow for the classification of the studied mixtures by the degree of structure-forming effectiveness, as well as confirm the influence of bentonite and polymer concentrations on the formation of the strength characteristics of stabilized sand. The observed decrease in plastic strength after 24-hour hardening indicates the initial stages of structure transformation, which requires further research aimed at assessing the long-term stability of the formed coatings.

In general, the use of bentonite-polymer strengthening compositions represents a rational, environmentally safe, and technologically accessible approach to the reclamation of shifting sands and reducing their deflationary activity. This method can be recommended for practical application in arid regions to prevent land degradation, reduce dust formation, and enhance the stability of natural landscapes.

EFFECT OF THE USE OF BIO- AND NANOPREPARATIONS ON RICE PLANTS IN SALINE SOILS

Shamuratova G.M.
Karakalpak State University named after Berdakh
E-mail: g.shamuratova0905@gmail.com

Summary: *This article presents a scientific analysis of the effects of using bio- and nanopreparations on the growth, development, and yield of rice cultivated on saline soils. The study was conducted on irrigated meadow-alluvial soils in the Nukus district of the Republic of Karakalpakstan. The experiment involved the rice variety "Nukus-2" and the application of the preparations "Novagumin" and "Microustirgich" According to the results, these preparations increased plant height, panicle length, grain number, and grain weight, ensuring a 2–5 centner per hectare yield increase compared to the control variant. Bio- and nanopreparations enhanced the activity of soil microorganisms and played an important role in maintaining agroecosystem stability. The widespread implementation of these technologies can significantly improve the efficiency of rice cultivation.*

Key words. *saline soils, rice, Nukus-2 variety, bio- and nanopreparations, Novagumin, Microustirgich.*

INTRODUCTION

Currently, one of the urgent tasks in the agriculture of Uzbekistan is the effective use of saline lands, improving their melioration state, and increasing yields. In our republic, rice is grown on 129.4 thousand hectares, and the role of rice cultivation in ensuring food security creates the need for its further development. Especially on saline soils, the introduction of new agrotechnological approaches is required for the full use of the potential of crops.

In recent years, the degradation of land resources, especially the intensification of the salinization process, has become one of the pressing problems in agriculture. In countries with arid and semi-arid climates, such as Uzbekistan, this situation seriously hinders the sustainable development of the agricultural sector. In solving this problem, the use of modern agricultural technologies, in particular, biological and nanotechnological preparations, is of great scientific and practical importance. Bio- and nanopreparations are an important factor in increasing the resistance of plants to stress, improving the assimilation of nutrients, and restoring yields by improving the soil environment. Scientific research shows that bio- and nanopreparations play an important role in stimulating the growth and development of plants, improving the microbiological environment of the soil, and increasing the assimilation of nutrients. These preparations affect not only the physiology of plants, but also the activity of beneficial microorganisms in the soil.

Cultivation of crops on saline soils is one of the urgent problems in the agricultural sector, and this problem is especially widespread in some regions of Uzbekistan, including Karakalpakstan. Soil salinization negatively affects plant nutrition, root system activity, and overall development. Therefore, many scientific studies have been conducted in these regions to eliminate the problem by using bio- and nanopreparations.

Foreign scientists E.P. Aleshin, M.M. Shukin, V.K. Bugaevsky, S.I. Ignatenko, K.G. Cassman, J.C. Ottow and others conducted extensive research on the influence of bio- and nanopreparations on plant physiology and soil microbiology [1,6,9]. According to their research, such preparations activate the plant's nutritional system, enhance root activity, stimulate photosynthesis, and positively affect yield.

K.G. Cassman (2000) emphasized in his work that sustainable and high yields can be achieved in rice farming by ensuring a nutrient balance[2]. Also, J.C. Ottow (1997) showed improvement in plant growth as a result of bioactive preparations increasing the activity of microorganisms in saline soils [3].

Domestic scientists I.I. Churikov, A.V. Nesterov, Z.N. Djumanov, G.N. Rakhimov, G. Juraeva, T. Boboniyazov studied the use of bio- and nanopreparations in the soil and climatic conditions of Uzbekistan and proved their effectiveness in rice cultivation [7,8,10].

In particular, the preparations "Novagumin" and "Mikroustirgich" contribute to the reproduction of microorganisms in the soil and have a positive effect on soil fertility [4,5].

The above-mentioned literature shows that bio- and nanopreparations not only accelerate the growth and development of rice in saline soils, but also serve as an important factor in restoring the balance of the agroecosystem.

RESEARCH METHODOLOGY

Research work was carried out on irrigated saline meadow-alluvial soils of the Nukus district of the Republic of Karakalpakstan. In the experiment, the "Nukus-2" rice variety was sown. Based on agrochemical analyses of the soil, it was assessed that the area is slightly saline, the humus content is low, and the mechanical composition is of medium loamy type.

In the experiment, the following variants were studied: Control (without the use of bio- and nanopreparations), Novagumin 1 - 1000 ml/ha, Novagumin 2 - 1200 ml/ha, Microustirgich 1 - 2100 ml/ha, Microustirgich 2 - 2400 ml/ha. The preparations were applied by foliar spraying during the seed treatment of the rice plant, at the 3-4 leaf stage, and at the heading stage. At each stage, the phenological development of plants, growth parameters (height, panicle length, number of grains, grain weight), and final yield indicators were recorded.

ANALYSIS AND MAIN RESULTS

Timely and optimal nutrition of the rice plant with nitrogen and phosphorus during the growing season accelerates seed germination, strengthens the root system, accelerates the processes of tillering and tubing, or when the norms of nitrogen and phosphorus substances and the periods of nutrition are disrupted, the respiration of the rice plant and its color change.

In irrigated meadow-alluvial soils, the Nukus-2 variety was sown, and as a result of our research, we analyzed the influence of the application of bio- and nanopreparations on the growth, development, and yield of rice.

Table 1

Influence of the application of bio- and nanopreparations on the growth, development, and yield of rice in irrigated meadow-alluvial soils (2020-2022)

№	Options	Thick seedlings league, units	Average plant height, cm	Panicle length, cm	Number of grains in a panicle, units	Grain weight in a panicle, g	Harvest medicine c/ha
1	Control	152	68,7	12,6	96,2	2,01	54
2	Novagumin 1	231	91,4	14,1	107,8	2,15	58
3	Mikroustirgich 1	220	84,5	13,2	102,5	2,10	57
4	Novagumin 2	253	98,9	14,7	115,9	2,21	59
5	Mikroustirgich 2	238	90,5	14,3	110,4	2,16	58

In our phenological observations, in the control variant, the plant density was 152 plants, the average plant height was 68.7 cm, the panicle length was 12.6 cm, the number of grains in the panicle was 96.2 pieces, the weight of grains in the panicle was 2.01 grams, and the yield was 54 c/ha.

In the Novagumin 1 variant, where bio- and nanopreparations were used, the plant density was 231 units, the average plant height was 91.4 cm, the panicle length was 14.1 cm, the number of grains in the panicle was 107.8 units, the weight of grains in the panicle was 2.15 grams, and the yield was 58 c/ha. In the Microustirgich 1 variant, the plant density was 220 units, the average plant height was 84.5 cm, the panicle length was 13.2 cm, the number of grains in the panicle was 102.5 units, the weight of grains in the panicle was 2.10 grams, and the yield was 57 c/ha, In the Novagumin 2 variant, the plant density was 253 units, the average plant height was 98.9 cm, the panicle length was 14.7 cm, the number of grains in the panicle was 115.9 units, the weight of grains in the panicle was 2.21 grams, and the yield was 59 c/ha, in the Microustirgich 2 variant, the plant density was 238 units, the average plant height was 90.5 cm, the panicle length was 14.3 cm, the number of grains in the panicle was 110.4 units, the weight of grains in the panicle was 2.16 grams, and the yield was 58 c/ha.

CONCLUSION

Based on the results of the experiments, it can be concluded that the above-mentioned patterns were repeated in the growth, development, and yield of rice, that is, the variants with the use of bio- and nanopreparations prevailed over the control variant, especially the best result was noted in the Novagumin variant, where the yield was higher by 2-5 centners compared to the control. Bio- and nanopreparations influence the activity of microorganisms and enzymes in the soil, the amount of nutrients, and contribute to the growth, development, and increase of plant productivity.

TECHNIQUE FOR INCREASING THE ENDURANCE OF YOUNG VOLLEYBALL PLAYERS IN COMPETITIVE CONDITIONS

Mamutov I.U.
Karakalpak State University named after Berdak

Summary: This article analyzes training methods, psychophysiological factors, and individual training models aimed at increasing the endurance of young volleyball players in competitive conditions. According to the research results, special interval loads, aerobic-anaerobic complex training, technical-tactical modeling, and methods for developing psychological stability enhance the athlete's adaptation to competitive stress. Scientifically based organization of the balance of load and recovery during the training process, the development of motivational and cognitive preparedness increases the ability of young volleyball players to play at a high tempo and accuracy for a long time. Therefore, a comprehensive and individualized approach is the most effective way to increase the endurance of athletes.

Key words: Volleyball; young athletes; endurance; competitive conditions; functional training; interval training; aerobic-anaerobic load; technical and tactical training; psychological stability; adaptation to stress; individualized training; physical training; sports pedagogy.

This is due to the increasing demands on the physical fitness of young volleyball players, especially in competitive conditions. Volleyball, as a team sport, places high demands on the physical qualities of athletes, among which endurance occupies one of the main places. Endurance allows athletes to maintain high performance throughout the game, which is especially important under conditions of strong competitive loads. "Modern research in the field of sports science emphasizes that the development of endurance in young athletes requires a special approach, taking into account their age, physiological, and psychological characteristics." [1, C. 112–113.].

The purpose of this article is to develop and experimentally substantiate a technique for increasing the endurance of young volleyball players in competitive conditions. To achieve this goal, the following tasks have been defined:

1. Study of the theoretical foundations of endurance development in young athletes, including physiological and psychological aspects.
2. Analysis of the features of competitive activity in volleyball and their influence on the level of endurance of athletes.
3. Development of a method for increasing endurance among young volleyball players adapted to the conditions of the competition.
4. Experimental verification of the effectiveness of the proposed methodology and assessment of its impact on the physical fitness of young athletes.

The process of training young volleyball players, and the topic of the article, is a method of increasing their endurance in competitive conditions. The relevance of the article lies in the fact that the developed technique, based on modern scientific approaches, significantly increases the level of endurance of young volleyball players and improves their competitive results.

Endurance is one of the main physical qualities that determines an athlete's success in various sports. In the scientific literature, endurance is characterized as the body's ability to withstand fatigue during prolonged physical exertion. Depending on the nature of the load, general and special endurance are distinguished. General endurance is characterized by the ability to perform long-term work of medium intensity, which is the basis for the development of special endurance. Special endurance, in turn, is associated with a specific sport and implies the ability to maintain a high level of performance in specific stressful conditions. In volleyball, special endurance is manifested in the ability of athletes to perform strong movements during the game, such as jumping, shaking, and striking.

Modern research emphasizes that endurance is a complex quality that depends on many factors, including physiological, biochemical, and psychological aspects. For example, endurance is related to the efficiency of the cardiovascular system, while anaerobic endurance is related to the ability of muscles to work in conditions of oxygen deficiency.

The development of endurance in young athletes has its own peculiarities associated with age-related changes in the body. During adolescence, the cardiovascular system develops actively, lung volume increases, and movement coordination improves. However, the nervous system and muscular apparatus of young athletes are not yet fully formed, which requires a careful approach to the training process. Excessive stress at this age can lead to overwork and injuries. Therefore, training should be aimed at the gradual development of endurance, taking into account the individual characteristics of each athlete.

Volleyball, as a sport, places high demands on the aerobic and anaerobic endurance of athletes. Endurance allows athletes to maintain their overall performance level, while anaerobic endurance is necessary for performing short-term intensive movements such as jumping and shaking. The main factors affecting endurance in volleyball are:

- Intensity and duration of training.
- Proper nutrition and recovery.
- Psychological stability in competitive conditions.

Modern methods of endurance training include interval training, circuit training, and the use of special exercises aimed at developing the body's aerobic and anaerobic capabilities. Circuit training, in turn, is aimed at developing general physical fitness and includes performing a number of exercises with minimal breaks.

Competitive volleyball training is characterized by high intensity and variable periods of activity and rest. This requires athletes to quickly recover and maintain high performance throughout the game. Psychological stability, which allows athletes to maintain concentration and act effectively in stressful situations, is of particular importance.

The development of methods for increasing the endurance of young volleyball players is based on modern scientific approaches to the educational process, taking into account the physiological, psychological, and technical aspects of athlete training.

In this case, the research methodology includes four main stages, each of which is aimed at achieving specific goals.

1. Diagnostics of the level of endurance

At the initial stage, a comprehensive diagnosis of the level of endurance of young volleyball players is carried out. The following tests are used for this:

- 1000m run: assesses aerobic endurance, which is important for maintaining overall performance throughout the game. [2, C 256].
- Jumping tests (for example, vertical jump): allow assessing the anaerobic capabilities of athletes necessary for performing sudden movements, such as blocks and attacks.
- Cooper's test (12 minutes run): general endurance and long-term strength are used to assess the body's ability to endure [3, C. 34–40].
- Pulse recovery test after exercise: allows you to assess the ability of the cardiovascular system to recover, which is an important indicator of endurance. [4, C. 56–60].

The diagnostic results allow us to determine the current physical fitness of athletes and identify weaknesses that require correction. Based on diagnostic data, individual training programs were developed, taking into account the level of physical fitness of volleyball players, age characteristics, and the specifics of competitive activity. Programs include:

- Aerobic exercises: they are aimed at developing general endurance and improving the cardiovascular system. Examples: long-term running, swimming, cycling.
- Anaerobic exercises: they are aimed at developing the ability to perform short-term intensive loads. Examples: interval training, Sprint, jumping exercises.
- Strength exercises: this includes resistance exercises aimed at developing muscle strength, which is necessary for performing powerful movements such as jumping and strikes.

The programs also take into account the psychological characteristics of young athletes, such as motivation, stress resistance, and the ability to concentrate.

The following exercises are used to develop aerobic and anaerobic endurance:

- Interval training: variable periods of high and low intensity. For example, 30 seconds of maximum movement (sprint), then 1-2 minutes of rest or light running. Such exercises improve aerobic and anaerobic endurance.

- Circuit training: includes performing a series of exercises (for example, jumping, pushing) with minimal breaks. This allows us to develop general physical fitness and endurance.

- Game exercises: simulating competitive conditions, such as playing volleyball with a small number of players or extended rally duration. This contributes to the development of specific endurance and psychological stability.

Regular monitoring of athletes' physical condition allows for the assessment of the effectiveness of the training process and the introduction of necessary corrections. For this purpose, the following are applied:

- Test: repeated endurance tests to assess progress.

- Analysis of indicators: assessment of such parameters as heart rate, recovery rate, degree of fatigue.

-Athletes' feedback: manifested taking into account the subjective feelings of athletes, such as fatigue, motivation, and well-being.

Based on the data obtained, changes are made to the training programs, such as increasing or decreasing the intensity of loads, adding new exercises, or changing the recovery mode.

The main means of training endurance are exercises aimed at developing the body's aerobic and anaerobic capabilities. These exercises are selected taking into account the specifics of volleyball and the individual characteristics of the athletes.

1. Running exercise

Running exercises are the main means of developing aerobic endurance. These include:

Long-distance running: running a distance of 3-5 km at a medium speed. This improves the functioning of the cardiovascular system and increases overall endurance.

Monitoring and analysis of competitive activity:

The study analyzed competitive games to assess how changes in endurance levels affect game performance, such as successful attacks, blocks, and number of moves.

Organization of the study:

- Determination stage: conducting preliminary tests to determine the initial level of endurance and psychological preparedness of athletes.

- Formative stage: implementation of the developed endurance training methodology for 6 months.

- Control stage: repeated test to assess changes in the level of endurance and psychological stability of athletes.

The research results confirmed the high effectiveness of the developed method for increasing the endurance of young volleyball players. The improvement of physical parameters, such as aerobic and anaerobic endurance, shows that the proposed training programs allow athletes to better cope with loads in competitive conditions. In addition, the improvement of such psychological indicators as a decrease in anxiety and an increase in motivation shows that the technique has a positive effect not only on physical, but also on the psychological preparedness of athletes. Special attention should be paid to improving competitive indicators, such as the number of successful attacks and blocks. This confirms that increasing endurance directly affects the effectiveness of game activity.

In conclusion, increasing the endurance of young volleyball players in competitive conditions is achieved, first of all, through the gradual improvement of their physical, psychophysiological, and tactical training indicators. Studies show that the athlete's ability to adapt to stress significantly increases through functional training combined with interval training based on special loads, aerobic-anaerobic training corresponding to body size, and game models.

At the same time, endurance in competitive conditions is associated not only with a physical factor, but also with cognitive stability and emotional control. Quick analysis of game dynamics, speed of decision-making, and stress management skills constitute the overall system of endurance. Psychological preparation, visualization, breath control techniques, and motivational modeling help young volleyball players maintain a stable energy resource during the competition.

The research results confirm that a comprehensive approach - individualization of physical loads, cyclical training combined with technical and tactical training, scientific programming of psychological training and recovery processes - effectively increases the endurance of young volleyball players. This allows you to maintain a high tempo for a long time in competitive conditions, play without losing the amplitude and accuracy of movements, and increase the speed of return.

Thus, the technique of increasing the endurance of young volleyball players is an integrative and multifactorial process, the effectiveness of which depends on the individualization of training, the scientifically based organization of the load-restoration balance, and the strengthening of the athlete's psychophysiological stability.

A CRITERION OR THISOMETRICITY OF *LOG*-ALGEBRAS OF TYPE I_n

Abdullaev R.
Tashkent University of Information Technologies
arustambay@yandex.com

Summary: *This paper establishes a criterion for determining the isometricity of non-commutative log-algebras constructed on von Neumann algebras of type I_n. Specifically, we derive necessary and sufficient conditions for these spaces to be isometric, presenting five such conditions. The analysis employs the decomposition of a type I_n von Neumann algebra as a tensor product of a function space and $B(H_n)$.*

Key words: *log-algebras, commutative and non-commutative von Neumann algebras of type I_n, Boolean algebra, isometry, exact normal finite trace.*

I.INTRODUCTION

Commutative and non-commutative log-algebras were introduced and studied in [1]. Further, in [2,3,4], isometries and isomorphisms of commutative log-algebras are studied. This article establishes a criterion for the isometricity of non-commutative *log*-algebras constructed on the von Neumann algebra of type I_n.

Definition 1. [5] A von Neumann algebra of type I_n is a von Neumann algebra M, which has the representation $M = L_\infty(X) \otimes B(H_n)$, where $B(H_n)$ is an algebra of $n \times n$ matrices. The center of the algebra M is identified with $L_\infty(X)$, where X is a complete non-atomic Boolean algebra.

In [6], commutative log-algebras were introduced as follows

$$L_{log}(X,\mu) = \{f \in L_0(X): \int_\Omega log(1+|f|)d\mu < \infty\}$$

where Ω is the identity element of the Boolean algebra X, and $L_0(X)$ is the algebra of measurable functions on the Boolean algebra X. The F-norm on X is introduced as follows

$$\|f\| = \int_\Omega log(1+|f|)d\mu.$$

It is clear that

$$L_p(X,\mu) = \left\{f \in L_0(X,\mu): \|f\|_p = \left(\int_\Omega |f|_1^2 d\mu\right)^p < \infty\right\}.$$

By the Radon-Nikodym theorem, we have

$$L_p(X,\nu) = \left\{f \in L_0(X,\nu): \|f\|_p = \left(\int_\Omega |f|^p d\nu\right)^{\frac{1}{p}} = \left(\int_\Omega h \cdot |f|^p d\mu\right)^{\frac{1}{p}} < \infty\right\}$$

where $\nu(x) = \mu(hx)$, i.e., $h = \frac{d\nu}{d\mu}$.

II. STATEMENT OF THE PROBLEM

In the case of any strictly positive measures μ and ν, the mapping $U: L_p(X,\mu) \to L_p(X,\nu)$, defined by the equality $U(f) = h^{-\frac{1}{p}} f, f \in L_p(X,\mu)$, is a linear isometry from $L_p(X,\mu)$ to $L_p(X,\nu)$, i.e. for any μ and ν, the spaces $L_p(X,\mu)$ and $L_p(X,\nu)$ are isometric.

A similar statement for the spaces $L_{log}(X,\mu)$ and $L_{log}(X,\nu)$ is generally incorrect. The main result of this work is the establishment of a necessary and sufficient conditions for the isometry of these spaces.

III. MAIN RESULT

Let M be a von Neumann algebra of type I_n with exact normal finite traces i and j. Let us denote by $L_{log}(M,i)$ non-commutative log-algebras constructed with respect to the algebra M from trace i. Let us denote by μ and ν the restrictions of traces i and j to algebras M. By Definition 1, we can show that the following equality holds

$$L_{log}(M,i) = L_{log}(X,\mu) \otimes B(H_n).$$

Take $h = \frac{d\nu}{d\mu}$ and $\Omega_> = \{\omega \in \Omega: h(\omega) > 1\}, \Omega_< = \{\omega \in \Omega: h(\omega) < 1\}, \Omega_= = \{\omega \in \Omega: h(\omega) = 1\} = \Omega \backslash (\Omega_> \cup \Omega_<)$.

++Denote

$$S_> = \mathrm{S}_> (\Omega, \mathrm{h}) = \frac{\int_{\Omega_>} (h(x)-1)d\mu}{\mu(\Omega_>)}$$

and

$$S_< = S_< (\Omega, h) = \frac{\int_{\Omega_<} (h(x)-1)d\mu}{\mu(\Omega_>)}.$$

The following theorem establishes five conditions equivalent to the isometry of the F-spaces $L_{log}(X,\mu)$ and $L_{log}(X,\nu)$. For commutative log-algebras, this theorem was proven in [3].

Theorem 1. Let M be an arbitrary von Neumann algebra of type I_n, and let μ and ν be finite strictly positive measures on X. Then the following conditions are equivalent:

i. $L_{log}(X,\mu)$ and $L_{log}(X,\nu)$ are isometric;
ii. $\int_\Omega h(\omega)d\mu = \mu(\Omega)$;
iii. $\int_\Omega h^{-1}(\omega)d\nu = \nu(\Omega)$ where $h^{-1} = \frac{d\mu}{d\nu}$;
iv. $\nu(\Omega) = \mu(\Omega)$;
v. $S_> = S_<$;
vi. There exists a measure preserving automorphism α from (X,μ) to (X,ν).

Let X be an arbitrary complete Boolean algebra, $e \in X$, $Xe = \{g \in X : g \leq e\}$. By $\tau(X_e)$ we denote the minimal cardinality of a set dense in X_e. An infinite complete

Boolean algebra X is called homogeneous if $\tau(X_e) = \tau(X_g)$ for any nonzero $e, g \in X$. The cardinality $\tau(X)$ is called the weight of the homogeneous Boolean algebra X.

Let X be a complete nonatomic Boolean algebra and μ be a strictly positive countably additive finite measure on X. Then, the decomposition of X into homogeneous components is at most countable.

Definition 2. [7] Denote by $\{\nabla_{u_i}\}$ the homogeneous components of the Boolean algebra X for which $\tau_{u_i} = \tau(\nabla_{u_i}) < \tau_{u_{i+1}}$, $\mu(u_i) < \infty$. Here u_i are the units of the Boolean algebra ∇_{u_i}. Then the matrix

$$\begin{pmatrix} \tau_{u_1} & \tau_{u_2} & \dots \\ \mu_1 & \mu_2 & \dots \end{pmatrix},$$

is uniquely defined, which we will call the passport of the Boolean algebra X with a finite measure μ.

Let Y be another complete Boolean algebra with a finite measure ν and

$$\begin{pmatrix} \tau_{t_1} & \tau_{t_2} & \dots \\ \nu_1 & \nu_2 & \dots \end{pmatrix}$$

is the passport of the Boolean algebra (Y,ν).

Let M_X and M_Y be von Neumann algebras of type I_n and I_m with faithful normal finite traces φ and η, respectively. Let μ and ν denote the restrictions of the traces of φ and η to the corresponding centers

$$L_{log}(M,\varphi) = L_{log}(X,\mu) \otimes B(H_n),$$
$$L_{log}(N,\eta) = L_{log}(Y,\nu) \otimes B(H_m).$$

With these notations, the following theorem holds.

Theorem 2. The following conditions are equivalent:

(i) The log-algebras $L_{log}(M_X, \varphi)$ and $L_{log}(M_Y, \eta)$ are isometric.

(ii) The log-algebras $L_{log}(X, \mu)$ and $L_{log}(Y, \nu)$ are isometric and $n = m$.

(iii) The passports of the Boolean algebras (X, μ) and (Y, ν) coincide and $n = m$.

BIOLOGICAL AND ECOLOGICAL CHARACTERISTICS OF INTRODUCED ROSE HIP SPECIES

Khalmuratov P.[1], Alieva P[2].
Karakalpak State University, [1] Professor of the Department of Agroecology and Introduction of Medicinal Plants, [2] Master's student
E-mail: xpolat1948@gmail.com

Summary: *The article presents the bioecological characteristics of introduced species of the rose hip genus of different geographical origin under the conditions of Karakalpakstan. Their adaptive capabilities under extreme growing conditions were studied. A comparative assessment of the sustainability of introduced rose hip species is provided.*

Key words: *Rose hip, Rosa L., bioecological characteristics, introduction, experience, growth, phenological development, generative period, flower, flowering, fruiting, fruit.*

The material for our research consisted of 4 species of the rose hip genus (Rosa L.) grown in the botanical garden of the Karakalpak branch of the Academy of Sciences of the Republic of Uzbekistan.

The objective of our work: to study the bioecological characteristics of introduced rose hip species under the conditions of Nukus city. Rose hips are typically multi-stemmed shrubs up to 2-3 m in height and can live for 30-50 years. The genus Rosa or rose hip (*Rosa* L) belongs to the Rosaceae family, subfamily Rosoideae. There are about 400 species. Leaves are spirally arranged, compound, odd-pinnate with 5, 7, 9 serrated leaflets, with stipules, usually fused to the petiole.

Flowers are bisexual, 5-petaled, solitary or collected in shield-shaped or brush-shaped inflorescences with 2-3 or many flowers. The hypanthium is spherical, ovoid, or pitcher-shaped, narrowed at the throat and with a glandular ring at the top; rarely the ring is absent. The corolla is large with a greater or lesser number of petals, colored in pink, red, or white tones. Sepals number 5, leaf-like, entire or pinnately dissected, directed upward or downward. Stamens are numerous, with 2-chambered anthers, attached to the glandular ring of the hypanthium. Pistils are numerous, sessile or on short stalks, arranged freely on the bottom of the hypanthium.

Fruits are small nutlets enclosed in a fleshy orange, red, or black shell, which is often used as a vitamin raw material. Rose hip species are characterized by the presence of thorns on the stems. By nature, thorns are epidermal, vascular-free formations. They appear on growing shoots during their growth period and at this time are relatively soft. As the stems age, the thorns increase in size and become very strong. They usually sit on narrow-oval bases elongated along cork foundations, through which they successfully increase. Thorns are very diverse in thickness and height. From hairs and bristles or needles, straight and thin, transitions are observed to thin slit-like or narrow-plate thorns, sometimes reaching a length of up to 12-13 mm or more.

The research was conducted in 2024-2025 at the botanical garden of the Karakalpak branch of the Academy of Sciences of the Republic of Uzbekistan. The garden is located on the southwestern outskirts of Nukus city. The territory of the botanical garden is characterized by flat terrain.

The objects of our research were plants of 4 rose hip species: dog rose (*R. canina* L), prickly rose (*R. acicularis*), May rose (*R. majalis* J.Herrm.), Korean rose (*R. coriana*). The research was conducted on plants aged 4-14 years in 2024-2025.

Phenological observations were carried out according to the methods of I.N. Beideman (1974), B.A. Dospekhov (1985), I.G. Serebryakov (1962) [1,2,3]. The greatest attention was paid to the condition of plants after overwintering, the nature of vegetation, growth, flowering, and fruiting. The beginning of vegetation was taken as the completion of bud opening, and the end as the period of leaf fall. The beginning of flowering was taken as the moment when single flowers bloomed (no more than 10% of all buds) on the plant, mass blooming about 70% of buds, and the end of flowering as the fall of petals from the last flowers. The beginning of fruit ripening was taken as the start of ripening of single fruits (no more than 10%), and mass ripening when 70-75% of fruits had ripened.

During the periods of leaf opening and plant flowering, observations were conducted daily, and at other times every 5 days. The condition of plants at the time of observations was recorded in a journal. The growth rhythm of plants was studied through systematic observations and measurements of shoot growth in model shrubs.

On each shrub, 5 shoots were counted: 4 lateral and 1 apical. Lateral shoots were selected in the middle part of the crown. We studied the growth of vegetative shoots. Measurements of their growth were conducted every 10 days. One indicator of successful plant introduction in new conditions is its growth. The table presents average data on the linear growth of 4 studied rose hip species.

Table 1

Linear growth of shoots of some rose hip species (for 2025)

Species	Average shoot length in cm	Annual growth in %		
		April	May	June
Dog rose	7.96±0.75	17.8±0.35	82.2±0.95	85.7±0.75
Prickly rose	7.96±0.35	17.8±0.25	82.2±0.75	-
Korean rose	8.74±0.25	5.492±0.45	94.58±0.85	-
May rose	3.19±0.15	9.42±0.55	90.58±0.65	-

As can be seen from this table, in 1925 (note: likely meant 2025) the shoot length was greater in Korean rose. Introduced rose hip species under Nukus conditions grow intensively in May, when relative air humidity is quite high and temperature is relatively low. In June their growth ends. Shoot growth is completed by the formation of a terminal inflorescence or terminal bud.

Studies showed that after shoot growth completion, they can grow again. This was observed in dog rose. Secondary growth in dog rose begins in the first decade of June and ends in the third decade.

These species grow well, bloom abundantly, and fruit satisfactorily despite the extremely arid conditions of Karakalpakstan. Flowering periods under Nukus conditions were established as a result of two years of observations and are presented in Table 2.

Table 2

Flowering periods of rose hip genus species under Nukus conditions

Species	2024				2025			
	start	mass	end	Duration	start	mass	end	Duration
Dog rose	16.05	25.05	31.05	16	14.05	22.05	5.06	23
Prickly rose	18.05	25.05	5.06	19	15.05	25.05	12.06	29
Korean rose	10.05	16.05	30.05	20	11.05	18.05	4.06	26
May rose	11.05	16.05	25.05	15	15.05	23.05	29.05	15

The table shows that in Nukus in 2024, early flowering was observed in Korean rose (10.05) and May rose; dog rose bloomed on 16.05, and prickly rose began flowering last (18.05). In 2025, Korean rose also blooms first (11.05), followed by dog rose (14.05), May rose (15.05), and prickly rose (15.05).

The flowering duration of rose hip species depends primarily on their nature, weather conditions of the growing season, and cultural conditions, especially intermittent irrigation. It should be noted that the flowering duration of dog rose lasts 16-23 days, Korean rose 20-25 days, prickly rose 19-29 days, and May rose 15 days. Plant flowering proceeds from the top to the base of the crown. In addition, prickly rose exhibits secondary and tertiary flowering. The results are presented in Table 3.

Table 3

Dates of secondary and tertiary flowering of rose hip genus species under Nukus conditions (2025)

Species	**Secondary flowering**							
Prickly rose	**Flowering**			**Fruit formation**			**Ripening**	
	start	mass	End	start	mass	end	start	end
Species	**Secondary flowering**							
	9.07	14.07	26.07	13.07	21.07	29.07	18.08	29.08
	Tertiary flowering							
	4.08	7.08	13.08					

As can be seen from the table, secondary flowering began in July (9.07) until the end of July (26.07), and forms fruits (13.07) in the second half of July. Fruit ripening is observed in the second half of August (18.08). Tertiary flowering is observed in the first half of August (4.08) and does not form fruits. The duration of secondary flowering in prickly rose lasts 18 days, and tertiary flowering 10 days. The period from flowering to fruit ripening lasts 52 days.

Conclusion

As a result of our work on studying the introduction of rose hip genus species in Karakalpakstan during the period from 2024 to 2025, the following conclusions can be drawn:

- The sharply continental climate and soil salinity of the Nukus botanical garden area, with irrigation available, do not prevent the introduction of a number of rose hip genus species.
- The phenology of rose hip genus species under Karakalpakstan conditions is not uniform.
- The experiments we conducted showed that for all studied rose hip species, intensive growth occurs in May. During this period, about 90% of growth is provided.
- The flowering duration of rose hip species depends primarily on their biological characteristics, weather conditions of the growing season, and cultural conditions. It should be noted that the flowering duration of dog rose lasts 16-23 days, Korean rose 20-25 days, prickly rose 19-29 days, and May rose 15 days.
- Prickly rose exhibits secondary and tertiary flowering. The duration of secondary flowering lasts 18 days, and tertiary flowering 10 days.
- In rose hip species, the formation of covering scales begins in April. The differentiation of flower buds in rose hips, depending on the species, begins at different times. The differentiation of flower buds in dog rose (21.06), May rose (26.06), and prickly rose (21.06) begins at the same time, while in Korean rose it is later than in other species (6.07). The laying down of vegetative and generative buds in different rose hip species begins in April. The differentiation of their growth cone into individual flower elements occurs in June, July, August, and September.
- Rose hip species reproduce by seeds. In general, rose hip genus species can be propagated by seeds and cuttings.

THE SPACE OF ORDER-PRESERVING FUNCTIONALS AND PERFECT COMFACTIFICATION

Jiemuratov R.E.
Nukus State Pedagogical Institute named after Ajiniyaz

Summary: *For a Tychonoff space X, we consider the space $O_f(X)$ of order-preserving functionals. Using a cover γ_X of the original space X we build an open cover γ_0 of $O_f(X)$. Then we show that if γ_X is disjoint system then γ_0 is also disjoint system. It is proven that the space $O_f(\beta X)$ of order-preserving functionals on the Stone-Čech compactification of X is a perfect compactification of $O_f(X)$.*

Keywords: *order-preserving functional, cover, perfect compactification.*

1. Introduction

The study of topological spaces and their properties has long been a central topic in mathematics, with particular interest in understanding completeness properties and compactifications. Among these, the concept of Π-completeness, investigated in [1], has emerged as a significant property that generalizes classical notions of compactness in topology. In [2] it was explored several types of such spaces, which called compact type spaces. Actions by hyperspace functor on such spaces were studied in [3].

It should be noted that mathematical results are increasingly used in various areas of modern research. For example, monetary risk measures [4] (or, order-preserving functionals) play an important role in risk assessment and management for banks, securities companies, investment funds, and other financial institutions in asset allocation and performance evaluation. In [5] some important topological properties of the space of order-preserving functional on a compact Hausdorff space were obtained. Particularly, normality properties picked up in [6] have shown (except so called "preserving preimages") for functor O of order-preserving functionals in the category $\mathcal{C}omp$ of compact Hausdorff spaces and their continuous maps. Using a construction suggested in [7] the author of [8] has extended this functor on the category $\mathcal{T}ych$ of Tychonoff spaces and their continuous maps.

In this paper, to make this criterion bears fruit firstly we showed that the space $O_f(\beta X)$ of order-preserving functionals on the Stone-Čech compactification of X is a perfect compactification of $O_f(X)$ of order-preserving functionals. It is worth to remind the set systems play a key role in studying of classes of compact type space. For a given system γ_X of subsets of a Tychonoff space X we build a set system γ_0 in $O_f(X)$. We get that the openness of γ_X implies the openness of γ_0. Moreover, we obtain that if γ_X is a disjoint system then γ_0 is also a disjoint system.

2. Preliminaries

In the present paper, by a space we mean a topological T_1-space, and by a map a continuous map. Recall that a Tychonoff space is [9] a space X such that every closed subset F in X and any point $x \in X \setminus F$ are functionally separated, i.e. there exists a continuous function $\varphi : X \to \mathbb{R}$ for which $\varphi(x) = 0$ and $\varphi(y) = 1$ in $y \in F$.

For a topological space X and its subset A, a set $Fr_X A = [A]_X \cap [X \setminus A]_X = [A]_X \setminus Int_X A$ is called a boundary of A in X. A compactification υX of a Tychonoff space X is called *perfect* with *respect to an open set H* in X if the equality $[Fr_X H]_{\upsilon X} = Fr_{\upsilon X}\mathfrak{O}_{\upsilon X}(H)$ holds. If υX is perfect for every open set in X, then *it is called a perfect compactification* of the space X ([10], p. 232).

A compactification υX of space X is perfect if and only if for any two disjoint open sets U_1 and U_2 in X the equality $\mathfrak{O}(U_1 \cup U_2) = \mathfrak{O}(U_1) \cup \mathfrak{O}(U_2)$ holds [10]. The Stone-Čech compactification βX of a Tychonoff space X is a perfect compactification of X. The equality $\mathfrak{O}(U_1 \cup U_2) = \mathfrak{O}(U_1) \cup \mathfrak{O}(U_2)$ holds for every pair of open sets U_1 and U_2 in X if and only if X is normal, and the compactification υX coincides with the Stone-Čech compactification βX, i. e. $\upsilon X \cong \beta X$.

For a compact Hausdorff space X a functional $\mu : C(X) \to \mathbb{R}$ is said [5] to be:

1) *normalized* if $\mu(c_X) = c$ for every constant function $c_X : X \to \mathbb{R}$, $c \in \mathbb{R}$. Here $c_X(x) = c$;

2) *weakly additive* if $\mu(\varphi + c) = \mu(\varphi) + c$ for every $c \in \mathbb{R}$ and each $\varphi \in C(X)$;

3) *order-preserving* if $\mu(\varphi) \le \mu(\psi)$ for any pair of functions φ, $\psi \in C(X)$ with $\varphi \le \psi\}$.

A weakly additive, order-preserving, normalized functional for brevity is called as an order-preserving functional. A set of all order-preserving functionals on $C(X)$ is denoted by $O(X)$. It is endowed with the topology τ_p of pointwise convergence. For $\mu \in O(X)$ sets

$$\langle \mu;\varphi_1,\dots,\varphi_n;\theta\rangle = \{\nu \in O(X) : |\nu(\varphi_i) - \mu(\varphi_i)| < \theta, i = 1,\dots,n\}$$

form a base of $O(X)$ at μ. Here $\varphi,\dots,\varphi_n \in C(X)$, $\theta > 0$.

Let A be a closed subset of a compact Hausdorff space X. An order-preserving functional $\mu \in O(X)$ is *supported* on A if $\mu \in O(A) \subset O(X)$. The support of $\mu \in O(X)$ is denoted by $supp\mu$. For a positive integer n let $O_n(X)$ denote a set of all order-preserving functionals which support consists no more than n points. Put $O_\omega(X) = \bigcup_{n=1}^{\infty} O_n(X)$. An order-preserving functional $\mu \in O_\omega(X)$ is said to be an order-preserving functional with finite support. For a point $x \in X$ the Dirac measure $\delta_x : C(X) \to \mathbb{R}$ is defined by equality $\delta_x(\varphi) = \varphi(x)$ for all $\varphi \in C(X)$. Clearly, $supp\delta_x = \{x\}$.

Following [11] an order-preserving functional $\mu \in O_\omega(X)$ with finite support $supp\mu = \{x_1,\dots,x_n\}$ can be represented as a relation $\mu = \mu(\delta_{x_1},\dots,\delta_{x_n})$ between the Dirac measures δ_{x_i}, $i = 1,\dots,n$. This relation has a view $\mu(\varphi) = \mu(\varphi(x_1),\dots,\varphi(x_n))$, $\varphi \in C(X)$.

We consider the following types of "restrictions":

$$\begin{aligned} \mu_{x_i}(\varphi) &= \mu(\epsilon,\dots,\epsilon,\varphi(x_i),\epsilon,\dots,\epsilon), \\ \mu^{x_i}(\varphi) &= \mu(\varphi(x_1),\dots,\varphi(x_{i-1}),\epsilon,\varphi(x_{i+1}),\dots,\varphi(x_n)), \end{aligned} \tag{1}$$

for each $\varphi \in C(X)$. Here $\epsilon = -\infty, 0$ or $+\infty$ (for more detail, see below).

For α, $-\infty < \alpha < +\infty$, and a subset $A \subset O(X)$ we put $\alpha A = \{\alpha\mu : \mu \in A\}$. If $\alpha = 0$ then $\alpha A = \{0\}$, and if $\alpha = 1$ then $\alpha A = A$. Note that for numbers α, β, subsets A, $B \subset O(X)$ we have $\alpha A + \beta B = \{\alpha\mu + \beta\nu : \mu \in A, \nu \in B\} \subset O(X)$ if and only if $\alpha, \beta \geq 0$ and $\alpha + \beta = 1$. Moreover, the set $O(X)$ of all order-preserving functionals is closed under affine combination. In other words, for $\{\mu_i : i = 1,\dots,n\} \subset O(X)$ and $\{\alpha_i : i = 1,\dots,n\} \subset [0,1]$ with $\sum_{i=1}^{n} \alpha_i = 1$ we have $\sum_{i=1}^{n} \alpha_i \mu_i \in O(X)$. Obviously, $\alpha_i \mu_i \in \alpha_i O(X)$, and $\sum_{i=1}^{n} \alpha_i O(X) = O(X)$. If $0 \leq \alpha_i < 1$ then $\alpha_i O(X) \neq O(X)$. In the case $0 < \alpha_i < 1$ we will say that $\alpha_i O(X)$ is parallel to $O(X)$. For an open neighborhood $\langle \mu_i; \varphi_{i1},\dots,\varphi_{in_i}; \theta_i \rangle$ the set $\alpha_i \langle \mu_i; \varphi_{i1},\dots,\varphi_{in_i}; \theta_i \rangle$ is an open in $\alpha_i O(X)$ neighborhood of $\alpha_i \mu_i$, $i = 1,\dots,n$. Consequently, the sum $\sum_{i=1}^{n} \alpha_i \langle \mu_i; \varphi_{i1},\dots,\varphi_{in_i}; \theta_i \rangle$ is open in $\sum_{i=1}^{n} \alpha_i O(X) = O(X)$.

Thus, the affine combination is one of the "rule"s for forming an order-preserving functional, using a given (at most countable) set of order-preserving functionals. In this case any order-preserving functional μ with finite support has a view $\mu = \sum_{i=1}^{n} \alpha_i \delta_{x_i}$ for $\alpha_i \geq 0$, $i = 1,\dots,n$, and $\sum_{i=1}^{n} \alpha_i = 1$. Consequently, for an arbitrary $\varphi \in C(X)$ we have

$$\mu_{x_i}(\varphi) = \alpha_i \varphi(x_i),$$

$$\mu^{x_i}(\varphi) = \alpha_1 \varphi(x_1) + \dots + \alpha_{i-1} \varphi(x_{i-1}) + \alpha_{i+1} \varphi(x_{i+1}) + \dots + \alpha_n \varphi(x_n).$$

The arbitrariness $\varphi \in C(X)$ gives that in this case equalities (1) turn into a view

$$\mu_{x_i} = \mu(0,\dots,0,\delta_{x_i},0,\dots,0) = \alpha_i \delta_{x_i},$$

$$\mu^{x_i} = \mu(\delta_{x_1},\dots,\delta_{x_{i-1}},0,\delta_{x_{i+1}},\dots,\delta_{x_n}) =$$

$$= \alpha_1 \delta_{x_1} + \dots + \alpha_{i-1} \delta_{x_{i-1}} + \alpha_{i+1} \delta_{x_{i+1}} + \dots + \alpha_n \delta_{x_n}.$$

Let

$$\max\{\alpha + A, \beta + B\} = \{\max\{\alpha + \mu, \beta + \nu\} : \mu \in A, \nu \in B\},$$

$$\min\{\alpha + A, \beta + B\} = \{\min\{\alpha + \mu, \beta + \nu\} : \mu \in A, \nu \in B\}$$

for some α, β, $-\infty \leq \alpha, \beta \leq +\infty$ and $A, B \subset O(X)$. Evidently, $\max\{\alpha + A, \beta + B\} \subset O(X)$ if and only if $-\infty \leq \alpha, \beta \leq 0$ and $\max\{\alpha, \beta\} = 0$. And also, $\min\{\alpha + A, \beta + B\} \subset O(X)$ if and only if $0 \leq \alpha, \beta \leq +\infty$ and $\min\{\alpha, \beta\} = 0$. In these two cases any order-preserving functional μ with finite support has views:

$$\mu = \max_{i \in \{1,\dots,n\}} \{\alpha_i + \delta_{x_i}\} \text{ for } -\infty \leq \alpha_i \leq 0, \quad i = 1,\dots,n, \text{ and } \max_{i \in \{1,\dots,n\}} \{\alpha_i\} = 0;$$

$$\mu = \min_{i \in \{1,\dots,n\}} \{\alpha_i + \delta_{x_i}\} \text{ for } 0 \leq \alpha_i \leq +\infty, \quad i = 1,\dots,n, \text{ and } \min_{i \in \{1,\dots,n\}} \{\alpha_i\} = 0.$$

For an arbitrary $\varphi \in C(X)$ we have

$$\mu_{x_i}(\varphi) = \alpha_i + \varphi(x_i),$$

$$\mu^{x_i}(\varphi) = \max\{\alpha_1 + \varphi(x_1),\dots,\alpha_{i-1} + \varphi(x_{i-1}), \alpha_{i+1} + \varphi(x_{i+1}),\dots,\alpha_n + \varphi(x_n)\}$$

in the maximum case, and

$$\mu_{x_i}(\varphi) = \alpha_i + \varphi(x_i),$$

$$\mu^{x_i}(\varphi) = \min\{\alpha_1 + \varphi(x_1),\ldots,\alpha_{i-1} + \varphi(x_{i-1}),\alpha_{i+1} + \varphi(x_{i+1}),\ldots,\alpha_n + \varphi(x_n)\}$$

in the minimum case.

Proposition 2.1. *Let* $\langle \mu;\varphi_1,\ldots,\varphi_n;\theta\rangle$ *and* $\langle \nu;\psi_1,\ldots,\psi_k;\delta\rangle$ *be open neighborhoods of order-preserving functionals* μ *and* ν*, respectively. Then the sets*

$$\max\{\alpha + \langle \mu;\varphi_1,\ldots,\varphi_n;\theta\rangle,\beta + \langle \nu;\psi_1,\ldots,\psi_k;\delta\rangle\}$$

$$(\textit{for each pair of } \alpha,\beta,-\infty \le \alpha,\beta \le 0 \textit{ with } \max\{\alpha,\beta\} = 0)$$

and

$$\min\{\alpha + \langle \mu;\varphi_1,\ldots,\varphi_n;\theta\rangle,\beta + \langle \nu;\psi_1,\ldots,\psi_k;\delta\rangle\}$$

$$(\textit{for each pair of } \alpha,\beta,0 \le \alpha,\beta \le +\infty \textit{ with } \min\{\alpha,\beta\} = 0)$$

are open in $O(X)$.

Proof. It is enough to establish the openness of one of the sets. The openness of the other one will be established similarly. We will work on showing the openness of the first set. Let $\Omega = \max\{\alpha + \langle \mu;\varphi_1,\ldots,\varphi_n;\theta\rangle,\beta + \langle \nu;\psi_1,\ldots,\psi_k;\delta\rangle\}$.

Three cases are possible.

1) $-\infty \le \alpha < \beta = 0$. Then $\Omega \cap O(X) = \langle \nu;\psi_1,\ldots,\psi_k;\delta\rangle$; in this case the set $\alpha + \langle \mu;\varphi_1,\ldots,\varphi_n;\theta\rangle$ lies in the "parallel" space $\alpha + O(X)$ as an open subset.

2) $-\infty \le \beta < \alpha = 0$. Then $\Omega \cap O(X) = \langle \mu;\varphi_1,\ldots,\varphi_n;\theta\rangle$, and $\beta + \langle \nu;\psi_1,\ldots,\psi_k;\delta\rangle$ is open in the "parallel" space $\beta + O(X)$.

So, in the above two cases, in general, the set $\alpha + \langle \mu;\varphi_1,\ldots,\varphi_n;\theta\rangle$ is open in the space $\alpha + O(X)$, and $\beta + \langle \nu;\psi_1,\ldots,\psi_k;\delta\rangle$ in $\beta + O(X)$. Consequently, the set Ω is open in $\max\{\alpha + O(X),\beta + O(X)\} = O(X)$.

3) $\alpha = \beta = 0$. Then $\Omega \cap O(X) = \Omega$ is open in $\max\{O(X),O(X)\} = O(X)$. Proposition is proved.

3. Perfect compactification of the space $O_f(X)$ of order-preserving functionals

For a compact Hausdorff space X put

$$O_f(X) = \{\mu \in O_\omega(X) : \textit{there exists a unique point } x \in \textit{supp}\,\mu = \{x_1,\ldots,x_n\}$$

$$\textit{such that } \left(\mu_x(1_X) \ge \tfrac{n}{n+1} \textit{ and } \mu^x(1_X) \le \tfrac{1}{n+1}\right) \textit{ or}$$

$$\left(\mu_x(1_X) = 1 \textit{ and } |\mu^x(0_X)| \ge \tfrac{n}{n+1}\right)\}. \qquad (2)$$

This construction was suggested in [12]. In [13] topological and categorical properties of the space $P_f(X)$ of probability measures, and in [14] topological and categorical properties of the space $I_f(X)$ of idempotent probability measures are explored. Note that $P_f(X)$ and $I_f(X)$ are subsets of $O_f(X)$.

Note that for a compact Hausdorff space X the set $O_f(X)$ is closed in $O(X)$.

For a point $x \in X$ we put

$$O_f^x(X) = \{\mu = \mu(\delta_{x_1},\ldots,\delta_{x_n}) \in O_f(X) : x \in \textit{supp}\,\mu,$$

$$\mu_x(1_X) \ge \tfrac{n}{n+1} \textit{ or } |\mu^x(0_X)| \ge \tfrac{n}{n+1}\}.$$

It is easy to see that

$$O_f^x(X) \cap O_f^y(X) = \varnothing \quad for\ every\ couple\ of\ \ x,y \in X\ \ with\ \ x \neq y$$

and

$$O_f(X) = \bigcup_{x \in X} O_f^x(X).$$

Let M be a subset in X. We put

$$\langle M \rangle = \{\mu \in O_f(X) : there\ exists\ \ x \in M\ \ such\ that\ \ \mu \in O_f^x(X)\}.$$

Proposition 3.1 *For an open set $U \subset X$ the set $\langle U \rangle$ is open in $O_f(X)$.*

Proof. Clearly, $\delta_x \in \langle U \rangle$ for every $x \in U$. Indeed, $\delta_x \in O_f^x(X)$ for each $x \in X$, in particular, for $x \in U$.

Fix x_0 and $\mu_0 \in O_f^{x_0}(X)$ with $|supp\mu_0| \geq 2$. Consider a function $\varphi \in C(X)$, $\varphi : X \to [0,1]$, such that $\varphi(x_0) = 1$ and $\varphi^{-1}((\frac{1}{2},1]) = U$. Then $\frac{2}{3} \leq \mu_{0x_0}(\varphi) \leq \mu_0(\varphi) \leq 1$, i. e., $\frac{2}{3} \leq \mu_0(\varphi) \leq 1$.

Let $\nu \in \langle \mu_0; \varphi; \frac{1}{6} \rangle \cap O_f(X)$. If $supp\nu = \{z\}$ and $z \notin U$ then $\nu = \delta_z$ and $\nu(\varphi) = \varphi(z) \leq \frac{1}{2}$. Adding $\frac{2}{3} \leq \mu_0(\varphi) \leq 1$ and $-\frac{1}{2} \leq -\nu(\varphi) \leq 0$ we get a contradiction $\frac{1}{6} \leq \mu_0(\varphi) - \nu(\varphi) \leq 1$. So, $z \in U$, i. e. $\nu \in \langle U \rangle$.

Consider the case $|supp\nu| \geq 2$. Let $\nu \in O_f^y(X)$. Then $\nu(\varphi) \geq \nu_y(\varphi) \geq \frac{2}{3}\varphi(y)$. Assuming $y \notin U$ we get $-\frac{1}{3} \leq -\nu(\varphi) \leq 0$, and consequently, $\frac{1}{3} \leq \mu_0(\varphi) - \nu(\varphi) \leq 1$. We received a contradiction again. So, $y \in U$, that equipped $\nu \in \langle U \rangle$. Thus, $\langle \mu_0; \varphi; \frac{1}{6} \rangle \cap O_f(X) \subset \langle U \rangle$. Proposition is proved.

Lemma 3.2 *For an arbitrary open cover $\gamma_X = \{U_\alpha : \alpha \in \mathfrak{A}\}$ of a Tychonoff space X the system*

$$\gamma_0 = \{\langle U \rangle : U \in \gamma\}$$

is an open cover of $O_f(X)$.

Proof. It requires to verify that:

$$\bigcup \gamma_0 \supset O_f(X).$$

Let μ be an arbitrary element of $O_f(X)$. There exists a point $x \in X$ such that $x \in supp\mu$ and $\mu \in O_f^x(X)$. Consequently, $\mu \in \langle U_x \rangle$ for each open neighborhood U_x of x. Since γ_X is open cover of X then there exists a set $U \in \gamma$ containing x. We have $\mu \in \langle U \rangle$. So, we conclude that every element of $O_f(X)$ is contained in some element of γ_0. We have completed the proof of lemma.

Note that $O_f(X)$ is everywhere dense in $O_f(\beta X)$ and $O_f(\beta X)$ is a compact Hausdorff space, then $O_f(\beta X)$ is one of compact extensions of $O_f(X)$. Now we can give the following result.

Theorem 3.3. *For a Tychonoff space X the space $O_f(\beta X)$ is a perfect compactification of the space $O_f(X)$.*

Proof. It is enough to consider open in $O_f(X)$ sets of the view $\langle U\rangle$ for open $U \subset X$. Let U_1 and U_2 be disjoint open sets in X. Since βX is the perfect compactification of X we have $\mathfrak{O}_{\beta X}(U_1 \cup U_2) = \mathfrak{O}_{\beta X}(U_1) \cup \mathfrak{O}_{\beta X}(U_2)$. Consider open sets $\langle U_i\rangle \; in \; O_f(X), i = 1,2.$

Lemma 3.2 provides $\langle U_1\rangle \cap \langle U_2\rangle = \varnothing$. We will show that

$$\mathfrak{O}_{O_f(\beta X)}(\langle U_1\rangle \cup \langle U_2\rangle) = \mathfrak{O}_{O_f(\beta X)}(\langle U_1\rangle) \cup \mathfrak{O}_{O_f(\beta X)}(\langle U_2\rangle).$$

The inclusion $\supset$ straightly follows from the definition of sets of the type $\mathfrak{O}(H)$. That is why it is enough to show the inverse inclusion. Let $\mu' \in O_f(\beta X)$ be an order-preserving functional such that $\mu' \notin \mathfrak{O}_{O_f(\beta X)}(\langle U_1\rangle) \cup \mathfrak{O}_{O_f(\beta X)}(\langle U_2\rangle)$. Then $\mu' \in O_f(\beta X) \setminus \mathfrak{O}_{O_f(\beta X)}(\langle U_i\rangle)$, $i = 1,2$. From [10] (see, p. 234) we have

$$O_f(\beta X) \setminus \mathfrak{O}_{O_f(\beta X)}(\langle U_i\rangle) = [O_f(X) \setminus \langle U_i\rangle]_{O_f(\beta X)}, \qquad i = 1,2.$$

Hence, $\mu' \in [O_\beta(X) \setminus \langle U_i\rangle]_{O(\beta X)}$, $i = 1,2$. Since $\langle U_1\rangle \cap \langle U_2\rangle = \varnothing$ by [3] we have

$$[O_f(X) \setminus \langle U_1\rangle]_{O_f(\beta X)} \cap [O_f(X) \setminus \langle U_2\rangle]_{O_f(\beta X)} = [O_f(X) \setminus (\langle U_1\rangle \cup \langle U_2\rangle)]_{O_f(\beta X)}.$$

Then $\mu' \in [O_f(X) \setminus (\langle U_1\rangle \cup \langle U_2\rangle)]_{O_f(\beta X)}$, or the same $\mu' \in O_f(\beta X) \setminus \mathfrak{O}_{O_f(\beta X)}\langle (U_1\rangle \cup \langle U_2\rangle)$. Consequently, $\mu' \notin \mathfrak{O}_{O_f(\beta X)}(\langle U_1\rangle \cup \langle U_2\rangle)$. Thus, we have just established that the inclusion $\mathfrak{O}_{O_f(\beta X)}(\langle U_1\rangle \cup \langle U_2\rangle) \subset \mathfrak{O}_{O_f(\beta X)}(\langle U_1\rangle) \cup \mathfrak{O}_{O_f(\beta X)}(\langle U_2\rangle)$ is also true. Theorem is proved.

HIBISCUS HYBRID .L. FROM THE SEED REPRODUCTION FEATURES

Rakhimova M.A.
Jizzakh State Pedagogical University, maloxat817@gmail.com

Summary: *This article provides information on the botanical description of Hibiscus hybrida, its climatic conditions, its distribution, species, and methods of growing, caring for, and propagating hibiscus*

Key words: *Hibiscus hybrida, tropical, sanitary, mineral substances, seed, hypocotyl.*

Conservation of biological diversity, protection of the plant world and their rational use are global problems. Therefore, special attention is paid to studying the bioecological characteristics of plant species, conducting introduction work, developing protection measures, identifying and preserving rare and declining species. In this regard, species of the genus *Hibiscus* L., which are used as ornamental plants, are of particular importance.

Hibiscus hybrida is a plant belonging to the rose family, and currently there are about 200 varieties of hibiscus. Hibiscus 18th century at the beginning In Europe of countries botany in the gardens grow started. Hibiscus mainly Asia Southeast in part tropical in the regions grows. Hibiscus bush or up to 3 m tall sufficient small It is a tree. It is its own 300 inside close type cover takes. Hibiscus hybrida passed in the 40s-50s of the century famous breeder scientist F.N. Rusanov by mineralized. Many annual scenic plant, hot and to humidity demanding, its flowers large, long time blooms. Very beautiful scenery flowers simple, large, diameter 15-20 cm until enough.

Hibiscus hybrid Malvaceae family this wonderful plants grows mainly in the tropical regions of exotic Southeast Asia. This plant is distinguished by its large, dazzling white flowers. The delicate petals of the flowers are wrapped around its edge with amazing beauty. Such far blooming many annual plant many hot in countries good This variety is not very demanding on soil composition. (1-pic.).

1-pic. Hibiscus hybrid

Hibiscus hybrida of flowers every kind in color to be and size with difference The flowers white , white yellow, rose colorful, red , pink, lilac (siren) colored, purple colored varieties there is. Hibiscus hybrida scenic, fast growth, every kind climate to the conditions flexibility with characteristic Hibiscus hybrid climate regionally far time blooming many annual from plants one is June of the month first from the decade to the cold until it falls blooms.

Hibiscus hybrida of the soil abiotic factors less demanding But good drained in soils good grows. Hibiscus hybrida gas and to smoke resistant city in the territory in landscaping application possible. Hibiscus hybrida seeds 3-4 years during themselves fallibility save remains seeds seeds

sprout output A temperature of 20-24 $^{\circ}C$is required. Prepare the existing soil in the garden by breaking it up to a depth of (30-40 cm) (use a hoe, spade or electric tiller). Add organic matter such as manure, peat moss until the soil is loose and easy to work. Organic ingredients improve drainage, add nutrients and encourage the growth of earthworms and other organisms that help keep the soil healthy. Give the plants a boost by adding a granular starter fertilizer or all-purpose fertilizer that promotes hibiscus growth.

Hibiscus seeds in the spring (March- April) months sprinkled, then sprinkled seeds over butt as in spring 0.5 cm, 1.0 cm in autumn sand sprinkled of sand over wood sawdust, manure with will be closed. Seed above sand and others with when closed thickness 1.5 -4.0 cm from not to exceed need. Then water bottle with light is irrigated. Seeds fertility easy 7-8 days then sprout come out starts in 12-15 days then in the open sprout It comes out. At this point hypocalyptus height 2.5 cm enough and his/her root with combined place will thicken and root feathers appearance it has been. Hibiscus is also easily propagated vegetatively, that is, by cuttings, root cuttings and grafting. In the fall, the stems of hybrid hibiscus are cut off 8-10 cm above the ground and covered with soil, humus or sawdust, and the bottom is opened in the spring. Hibiscus hybrid bushes are divided by dividing the shoots (in spring, as soon as the buds swell)

10 days of sprouts height 2.5 cm to The hypocotyl length 3.5 cm to 15 days in the buds three bud growth begins and then one no lateral roots 20 days true leaf in seedlings is formed, their 4 cm tall to enough. At this time root system much grows.

Uninhabited 1 month since release was of sprouts tall growth accelerated observation possible. 2 months old in sprouts this process further accelerates. Their tall middle 18 cm on account to enough for 3-4 pieces pine tree harvest will be 3 months old in sprouts tall growth accelerates. This time their height 31.5 cm to enough. 4 months sprouts tall intense growing continue At this time seed coat fall goes. 5 months old of sprouts tall growth sharp decreases. From this then of the plant tall growth almost stops.

Hibiscus of the plant good growth Mineral fertilizers are also needed. Basically to the water manure mixed (juice) (be) irrigated It's okay to stay. fertilized is considered. Hibiscus in the spring August of the month halfway per week one times fed, the rest at times one once a month phosphorus and potassium with 1 5 in dose is fed. In the garden planted hibiscus around special one beautiful giving stands. Scenic hibiscus forms China and Indonesia in the regions and gardeners It is also found in greenhouses. Hibiscus some scenic to the nets stopped let's go: (1-pic.).

*Hibiscus syriacus***.** China, India. Leaves hungry green, flowers every kind in color leaf weaver bush. Syria hibiscus slowly grows in 3-4 years flower starts. Up to 100 years life sees. As the years go by, it gets colder endurance increases and to a temperature of -22 °C endure give takes. Syria hibiscus average in the humidity good grows (lime) the soil doesn't like it), copy planting and to cut resistant. Syria hibiscus pencil welding and from the tribe good sprout comes out

Table 1.

Reproduction methods

Reproduction method	Recommendation done time	The method briefly description	Success level d	Advantages	Disadvantages
With seed multiply	Year during (in greenhouses), open spring to the ground end	Soak the seeds for 24 hours warm in the water wet , then 0.5 -1 cm in depth Planting . Substrate : perlite + peat(1:1).Temperature 24-30°C.	70 - 90% (varies) to varieties depending on)	Many in quantity plant to take possible , cheap	New plant mother plant does notretain 100% of its characteristics (especially in F1 hybrids, color andform difference to do possible). More time demand will (6-12 months) untilflowering

Bulb (stem) with apencil) multiply (most) wide widespread and reliable method)	Summer from the beginning until autumn (June September), the most better July - August	Half lignified (half hardened) stem 10–15 cm from the tip long pencil is cut off . Bottom leaves is taken , section place Kornevin or other root harvest doer to the drug Substrate : perlite + peat or sand + peat (1:1). Temperature 22-28°C, high humidity (mini-greenhouse) or package with closed). 3-5 weeks root shoots	85–95%	Mother of the plant all characteristi cs (color, shape , size) are 100% preserved . Fast blooms (3-6 months) inside).	Kalamcha to take for enough in quantity mother plant need .
Air welded	Spring end of summer at the beginning	On the stem ring in the form of bark is taken , wet sphagnum moss or peat with wrapped around , over film with Closed . 4-6 weeks inside root appearance will be , then mother from the plant cut is taken .	80 - 90%	Big the plant fast and reliable multiplicatio n possible , root system strong will be	Technique a little more complicated , more time demand will reach .
Bush become division	Spring at the beginning (plant when he wakes up)	Big bush caution with into pieces is , every one in a piece root and 2-3 buds will be left . Immediately new to the place is planted	90 - 95%	Fast , simple method , immediately big plant is taken	Only big , many annual bushes Suitable for . Mother the plant injury There is a risk

*Hibiscus moscheutos***.** Such wide large of the widespread species flowers there is - width about 12 cm. Each flower is distinguished by unusual carmine spots at the base of the corolla. This variety is used by many gardeners to create large bushes, which are used as hedges. Such an attractive flower needs a lot of light, warmth and a large area for proper growth. Swamp hibiscus can bloom for a long time.

Hibiscus coccineus. This is a perennial green plant Peaceful ocean the most beautiful on the islands, maybe your joint also great for decorating to be possible. This variety is unique for its very large bushes and flowers. The spreading, lush crown with branches makes it especially charming. Red hibiscus reproduces well by cuttings.

To the tree similar type**.** Big bright variety This variety is loved by many modern gardeners for its flowers. It is used as a hedge in front gardens. decoration for is used. The diameter of beautiful flowers does not exceed 10 cm. Complete flowering for good soil and permanent abundant irrigation demand will be done. This plant planting for You should choose sunny places protected from the wind. Hibiscus does not tolerate direct sunlight. the rays preferably sees. Winter during separately Attention is needed. Celsius at temperatures below 10 degrees Celsius all leaves pour sends

Air humidity does not play a special role in hibiscus growth. Spring and in the summer plant nitrogenous substances with nutrition possible. Even elementary Florists can also do this. The best thing about this method is that hibiscus grown from cuttings will delight you with flowering within a

year. The stem length 15 cm and 3 to 5 joint to be Also, the environment to the environment good adapts.

Hibiscus hybrida (Hybrid) hibiscus (plant) sharp continental to the environment flexible that was because in Uzbekistan ecological the situation improvement, major cities beautification, landscaping, for the population comfortable sanitary-hygienic and clean ecological environment in creation wide if applicable to the goal appropriate would be was .

OPTIMIZING RNA-BASED GENE ACTIVITY IN CREATING COLD STRESS-TOLERANT POTATO VARIETIES

Merganov A.T., Xamrayeva N.T.
Namangan Institute of Engineering Technology, Jizzakh State Pedagogical University,
nafisa.eshankulova@gmail.com

Summary: *This article provides detailed information on the cultivation of new potato varieties with enhanced cold-resistant genetic traits, their agronomic requirements from planting to maintenance, and effective agrotechnical methods.*

Key words *: Icarus, santo, romano, assimilation, cardinal, donor, transplant*

Potato (Solanum tuberosum L.) is one of the world's most important food crops, providing a primary source of nutrition for millions of people globally. More than 370 million tons of potatoes are produced worldwide each year, but climate change and cold stress (e.g., low temperatures, freezing) pose serious threats to the crop. Cold stress, particularly frost and post-frost damage, can reduce yields by up to 50%, and even short-term exposure has been shown to result in the loss of entire crops. For example, potato plants stop growing at temperatures below 7°C, suffer from frost damage at -0.8°C, and freeze damage below, costing billions of dollars in global agricultural production. Creating potato varieties resistant to cold stress is one of the pressing issues in agricultural biotechnology, and molecular biological approaches, in particular RNA-based gene activity optimization, play an important role in this process.

Cold stress induces a number of physiological and biochemical changes in plants, including damage to cell membranes, increased osmotic pressure, increased oxidative stress, and impaired photosynthesis. Under such conditions, plant adaptation mechanisms are activated, which is associated with the regulation of gene expression.

Of the President of the Republic of Uzbekistan No. PQ-269 dated September 8, 2025 “On additional measures to increase potato cultivation and further develop seed production in the republic” and the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No. 462 dated June 6, 2019 “On measures to ensure the supply of seed potatoes to agricultural producers for the 2019 harvest and the guaranteed filling of the domestic consumer market with socially important types of food products”, as well as regulatory and legal documents related to this activity, is one of the pressing issues of today [1,2]

Potatoes are one of the most important food crops in the world, but they are naturally very sensitive to cold: the plant dies at temperatures of −1 - 3 °C, and the tubers are damaged by freezing. Due to climate change and the need to expand potato cultivation in high-altitude areas and northern regions, the creation of varieties resistant to cold (especially spring and autumn frosts) has become a relevant scientific direction in the last 50–60 years.

The greatest progress in the development of cold-resistant potato varieties has been achieved through the use of wild Andean species and molecular marker-assisted selection (MAS). Today, there are commercial varieties that are cold-resistant to −5…−7 °C, mainly intended for the Andean region, China, and Russia. [3,4]

In the 2000s, transgenic potato varieties resistant to −7…−8 °C were obtained by overexpressing the CBF/DREB1 transcription factors (Pino et al., 2007, Plant Cell Reports). However, GMO potatoes are not permitted for commercial cultivation in many countries [5,6]

In Uzbekistan: “Sante”, “Romano”, “Impala” and local varieties “Navruz”, “Zakovat” showed better resistance to cold (data from the Scientific Research Institute of Breeding and Seed Production of the Republic of Uzbekistan, 2015–2023)

RESEARCH METHODOLOGY. In this regard, in order to improve the cold-resistant properties of potatoes, scientific research was conducted in the “In vitro” scientific laboratory of Jizzakh State Pedagogical University and in field conditions during 2024-2025 on the basis of molecular biology to improve the cold-resistant genetic properties of potatoes.

For this, we used Ikar and foreign varieties Sante, Romano and Cardinal, which were created by the method of natural selection adapted to local conditions, and the miracle variety of Jerusalem artichoke plant was used as a donor. Under laboratory conditions, the cold-resistant RNA gene, which has a dominant feature in Jerusalem artichoke cells, transgenic to Ikar, Sante and Romano potato varieties based on the technological scheme.

For this purpose, the genetic RNA gene in the Jerusalem artichoke cell was isolated in the laboratory according to the following method.

120 ml of plain water was taken and poured into a glass beaker, and 5 grams of NaCl and 5 ml of detergent were added to it to expand the cell tissue and enhance the fermentation properties, and the solution was cooled. The Jerusalem artichoke was cleaned of soil and bark and washed in cold water. The cleaned donor node was crushed in a mortar until it became homogeneous and a sample of 2-10 grams (in the required volume) was taken from it. 10 ml of cooled solution was poured over the obtained sample and mixed with a glass rod for 2 minutes. The mixture was placed in a conical tube, mixed in a centrifuge at low speed for 5 minutes, and the mixture was settled. 1-2 drops of isopropyl alcohol were added to the settled mixture to ferment the RNA gene and other compounds contained in it.

Figure 1. Jerusalem artichoke variety "Mo'jiza"

The clear mixture was collected using a pipette and the pure sediment was separated and the nutrient medium was prepared. The 2-3 cm seedlings grown in the nutrient medium of the potato variety were separated from the nodule and grown in the nutrient medium in a petri dish for 2-3 days until they reached 8-10 cm. seeds were grown. By taking a sample of the grown seed material, the types of latent viruses were determined using an electron microscope Mikromed-M and the levels of their damage were determined. The nodules of the healthy variety were kept at room temperature until plasmolysis. In November, the tubers were planted in an open field according to the varieties to a depth of 8-10 cm based on a scheme of 70x20 cm.

Figure 2. Planting stimulated potatoes in the fall

Before planting the nodules, different leaves that fell in the fall were placed in a thickness of 1-2 cm, 100 grams of biohumus fertilizer was added for each nodule, and the nodules were planted on

it. After planting, the ridges were leveled and the soil was broken into capillary tubes. During the autumn and winter, soil and air temperatures were monitored three times using minimum and maximum thermometers. According to observations over the years, in November, December, January and February, the average air temperature was -8-10 ^{0}C; in 2023, due to a prolonged anomalous cold, the air temperature was -25-27 ^{0}C. In this cold, the potato tubers were not damaged at all

ASSESSMENT OF LANDSCAPE MODIFICATION TRENDS BASED ON KEY CLIMATE CHANGE INDICATORS (A CASE STUDY OF JIZZAKH REGION)

Alimkulov N.R., Kholmurzayev J.E.
National Pedagogical University of Uzbekistan, Jizzakh State Pedagogical University

Summary: *This article assesses the modification trends of landscapes based on key climate change indicators using the Jizzakh Region as a case study.*

Keywords: *climate change, arid regions, main indicators of climate change, natural conditions of Jizzakh region, landscape analysis, modification trends.*

At present, climate change has become one of the most pressing issues among natural geographical processes. This global phenomenon is particularly evident in arid regions, where its impacts are more pronounced. Jizzakh Region can be regarded as one such territory.

Globally, an increase in average temperature of approximately 1.5°C was observed during the second half of the 20th century, and this trend has continued thereafter. The 2015 Paris Agreement indicated that global warming has approached nearly 3°C. In order to reduce global temperatures, countries are striving to rapidly limit the growth of greenhouse gas emissions and subsequently reduce them based on the best available scientific evidence, as well as economic and social measures.

Climate change does not occur uniformly across the globe. In the studied arid region, the impact of climate change on Jizzakh Region over the past 40 years was analyzed using tables and figures. The data sources included the Jizzakh Regional Hydrometeorological Department, Meteoblue.com ERA5, and the fifth-generation atmospheric reanalysis data of the European Centre for Medium-Range Weather Forecasts (ECMWF). These datasets cover the period from 1979 to 2023 with a spatial resolution of 30 km (Table 1; Figures 1, 2, and 3).

Based on the indicators presented in Table 1, the influence of winter–summer temperature and precipitation changes on landscapes within the zone of influence of inland waters of Jizzakh Region from 1979 to 2023 was analyzed. In the graphs, the dotted blue line represents the linear trend of climate change, blue indicates colder conditions, and red represents warmer temperatures. The lower graph shows an increase in the average annual air temperature in Jizzakh Region (Figure 1).

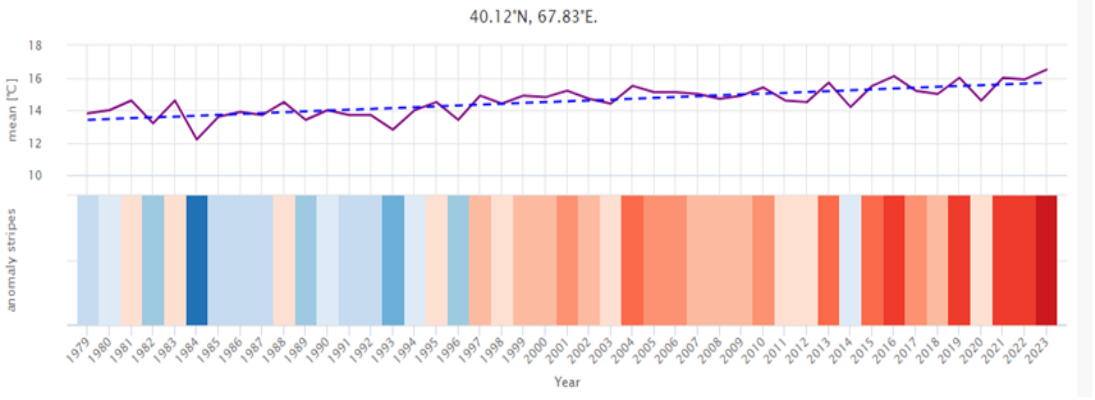

Figure 1. Changes in air temperature in Jizzakh Region (1979–2023)

In addition, precipitation in the region has decreased in line with rising air temperatures. The dotted blue line indicates the linear climate change trend, blue denotes colder conditions, and red denotes warmer conditions (Figure 2).

This graph illustrates the average total precipitation for Jizzakh Region. If the linear trend line of climate change rises from left to right, precipitation trends are positive and humidification increases; if the line is horizontal, no clear trend is observed; and if it slopes downward, aridification intensifies over time. The analysis shows that between 1979 and 2023, air temperature increased while

precipitation decreased, leading to changes in natural water bodies and a decline in landscape productivity.

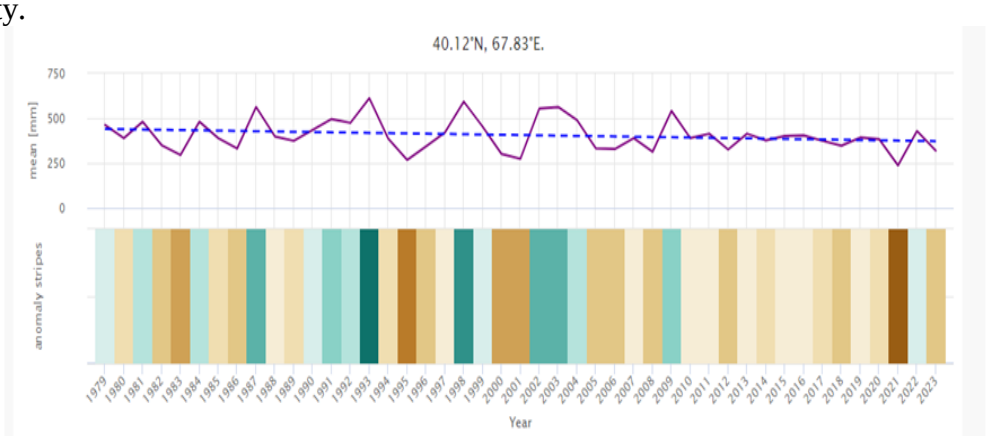

Figure 2. Changes in precipitation in Jizzakh Region (1979–2023)

Monthly temperature anomaly differences from 1979 to the present are presented for Jizzakh Region, showing how much warmer or cooler each month was compared to the 40-year climatic average (1979–2023). The analysis indicates an increase in the number of warm months over the years. The lower graph shows monthly precipitation anomalies, indicating whether precipitation amounts were above or below the 40-year average. Green months represent wetter-than-normal conditions, while brown months indicate drier conditions (Figure 3).

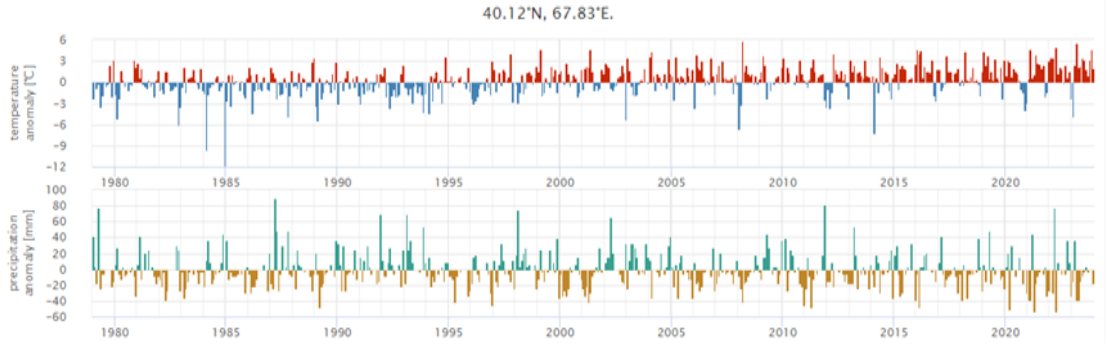

Figure 3. Differences in monthly temperature and precipitation anomalies in Jizzakh Region under climate change conditions.

Based on the analysis, differences in precipitation levels for 1979, 2000, and 2023 were identified. Compared to 1979, precipitation slightly decreased by 2000 and declined further by 2023 (Figure 4).

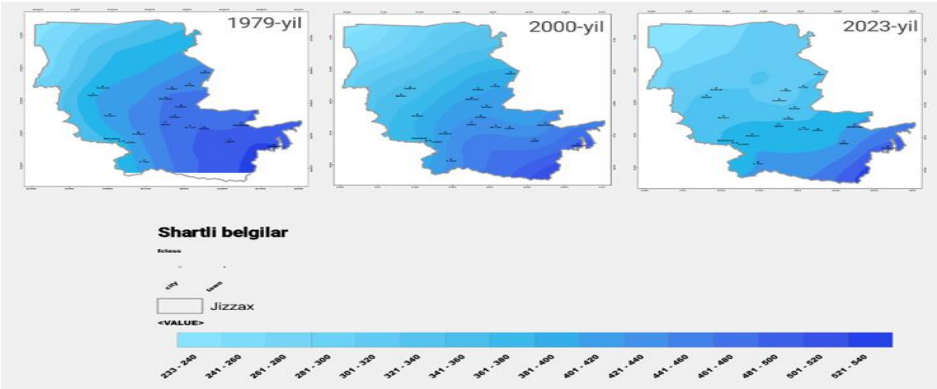

Figure 4. Map-scheme of precipitation anomalies in Jizzakh Region (1979–2023).

The analysis also revealed changes in evaporation rates during 1979–2000–2023. Due to the gradual increase in temperature over the years, evaporation rates increased accordingly (Figure 5).

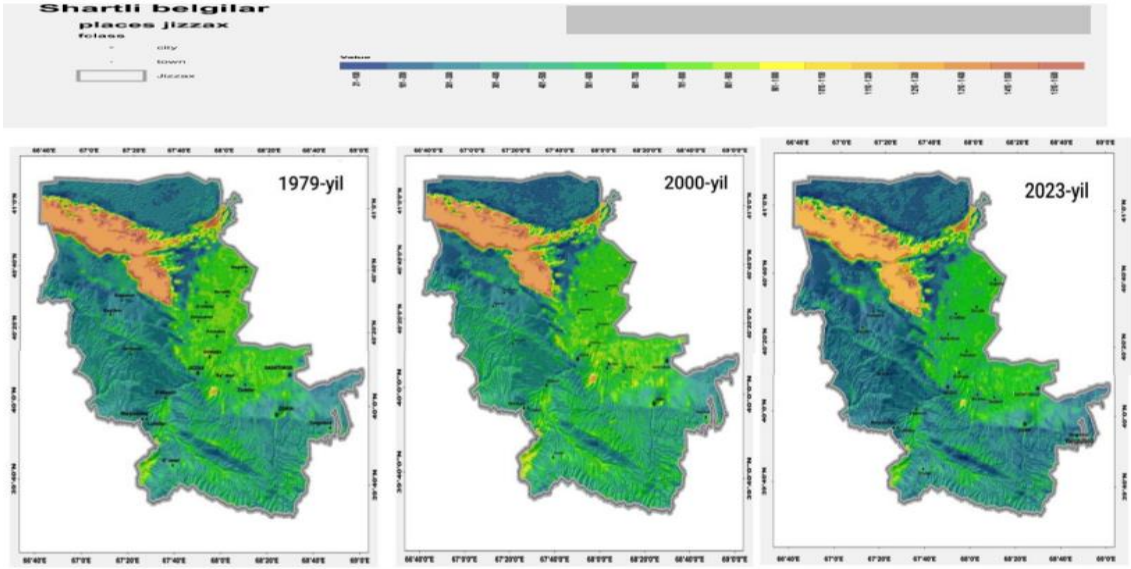

Figure 5. Map-scheme of evaporation differences in Jizzakh Region (1979–2023).

The conducted research demonstrates that global climate change has significantly affected Jizzakh Region. Due to its location in an arid zone, desertification processes are accelerating. This is particularly evident in inland water bodies and associated landscapes, especially within the Aydar–Arnasay Lake System (AALS), where declining water levels and increasing salinity have been observed. As a result, biodiversity in and around the lake has decreased. The number of morphological landscape units during periods of higher water levels differs significantly from current conditions. Between 1985 and 2023, salinity in AALS increased from 5.0 g/L to 8.1 g/L, while surface water temperature rose from 13.4°C to 15.8°C (Figure 6).

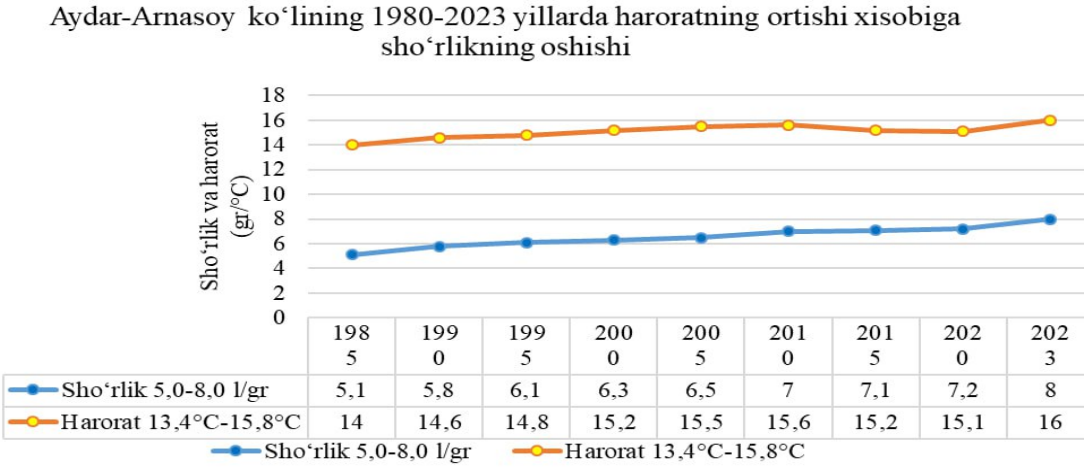

Figure 6. Increase in temperature and salinity in AALS (1980–2023).

Furthermore, the influence of the Kyzylkum Desert in the northern part of the lake has intensified. Saxaul forests are being replaced by shrubs, which in turn are replaced by ephemeral and ephemeroid vegetation. Similar processes are observed in other hydrographic objects of the region. Notably, increased anthropogenic pressure is evident along the middle and lower reaches of the Sangzor River, the lower reaches of the Zominsuv River, the northern parts of Jizzakh and Korovultepa reservoirs, and the lower sections of the Southern Mirzachul Canal. Consequently, a decrease in water discharge in inland waters has been observed, particularly in the Zominsuv River (Figure 7).

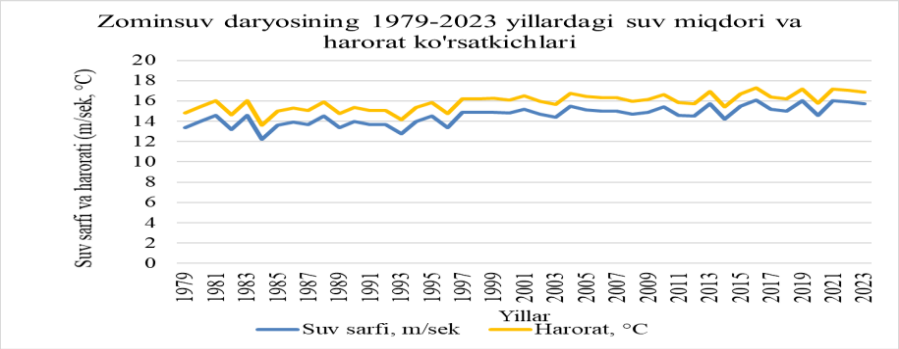

Figure 7. Water discharge and temperature indicators of the Zominsuv River (1979–2023).

The ongoing changes in climatic conditions have led to a reduction in water resources, accelerating desertification and drought processes. Observations over the past forty years show a clear correlation between climate change and declining water levels in both natural and hydraulic water bodies. By comparing trends in air temperature, evaporation, and precipitation—key indicators of global climate change-the dynamics of landscape transformation in Jizzakh Region were identified (Figure 8).

As in other regions of Uzbekistan, a rising trend in global warming has been recorded. The past seven years have been among the warmest on record, with 2016 and 2021 identified as the warmest years. The frequency and intensity of anomalously hot periods in spring and summer have increased. The number of days with air temperatures exceeding 40°C has grown, particularly in desert areas in the north and northwest, where anomalously hot days increased from 22 to 37 days. Prolonged dry periods have intensified atmospheric drought and water scarcity. In recent years, the number of days with atmospheric drought has ranged from 50 to 80 days. Strong winds have contributed to the formation and spread of dust storms. Notably, in November 2021, unprecedented dust and sand storms reduced visibility to 100–200 meters in Syrdarya and Jizzakh regions. Variability in PM2.5 dust concentrations has become a significant issue, exacerbated by industrial emissions, transport, and construction activities, further impacting water-related landscapes.

As a result, between 1979, 2000, and 2023, significant landscape changes were observed in Jizzakh Region (Figure 8). These changes have negatively affected soils, vegetation, and fauna, particularly in the Sangzor River basin and AALS. The northern part of the region is surrounded by hot and arid landscapes of the Kyzylkum and Mirzachul deserts, whose influence has recently expanded into foothill, mountainous, and water-rich landscapes. Increased salinity in AALS waters and declining fish populations illustrate the scale of these transformations.

Based on these results, the dynamics of landscape change in Jizzakh Region from 1985 to 2020 were developed. Special attention was given to changes in hydrographic objects, particularly river terraces, where combined effects of climate change and anthropogenic pressure have accelerated landscape degradation.

From a landscape-ecological assessment perspective, the following evaluation categories were established:

- **Unfavorable level** – Areas unsuitable for geoecological, agricultural, and recreational development, including high and medium-high mountainous, rocky, and eroded watershed zones with limited resources.
- **Less favorable level** – Areas with limited potential for development but suitable for guesthouses, hunting, fishing, water tourism, and health resorts near rivers and reservoirs.
- **Moderately favorable level** – Landscapes moderately suitable for agricultural and recreational activities, mainly in upper parts of small stream valleys.
- **Favorable level** – Landscapes suitable for agriculture and recreation, including forested areas and stream banks.

Highly favorable level – The most suitable landscapes for geoecological, agricultural, and recreational use, including riverbanks, forested slopes, and meadow-rich areas ideal for health and recreation facilities.

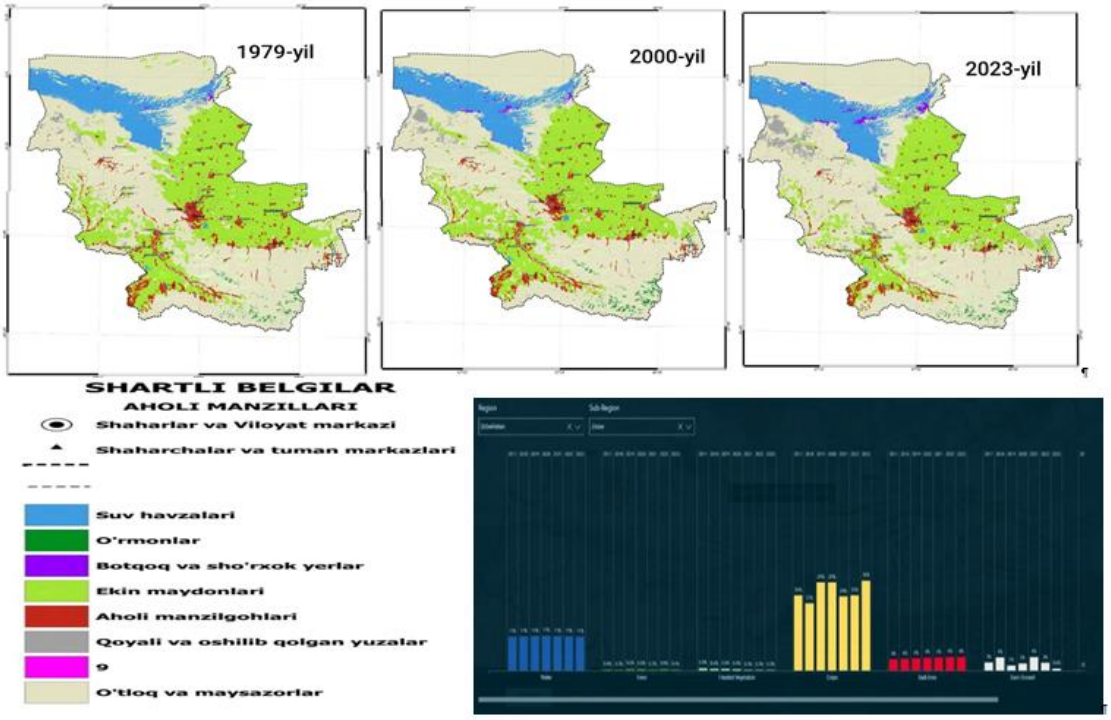

Figure 8. Map-scheme of landscape changes in Jizzakh Region (1979, 2000, and 2023)

Table 1

Meteorological indicators of Jizzakh region in 1979-2023

STUDY OF THE (*CARYOPHYLLACEAE)* FAMILY INCLUDED IN THE RED BOOK OF THE REPUBLIC OF UZBEKISTAN

Qarshiboyeva N.H.
Jizzakh State Pedagogical University

Summary: *The new edition of the Red Book of the Republic of Uzbekistan includes 329 plant species belonging to 48 families. Ten species belonging to the family Caryophyllaceae are included in the Red Book. The species found in the Molguzar, Turkestan and Nurota mountain ranges of the Jizzakh region were analyzed according to literature sources. These include species such as Kachimsimon yetmak (bex) – Allochrusa gypsophiloides, mountain silena – Silene oreina, and glandless silena – Silene paranadena. A table was compiled for species belonging to the Caryophyllaceae family.*

Key words: *Red Book, Caryophyllaceae family, protection, endemic, life forms.*

The conservation of plant diversity has great vital importance for humanity. On December 3, 2004, the laws "On Protected Natural Areas," on September 21, 2016, the law "On the Protection and Use of Plant Resources," and on April 16, 2018, the law "On Forests" were adopted in a new edition. These laws are important documents for preserving all plant species, protecting them, and ensuring their conservation. [3] According to the 2019 edition of the Red Book, 329 plant species of Uzbekistan's flora are considered at risk of extinction. Specialists and scientists of the Republic continuously study their current status. Their observations show that the number and distribution of some species have significantly increased. [5] According to data from 2009, 321 plant species were included in the Red Book [1], while the 2019 edition contains 329 species belonging to 48 families. [3] Among these, ten species belong to the Caryophyllaceae family. A table was compiled for species of the Caryophyllaceae family included in the Red Book. The table provides extensive information such as local and scientific names, rarity status, distribution area, life form, and conservation measures. A description of the family was given. Based on literature, descriptions of some species were provided, and their conservation measures were studied. Caryophyllaceae — a family belonging to the order Caryophyllales. It includes subshrubs, as well as annual, biennial, and perennial herbs. The family comprises about 2000 species belonging to 80 genera. In Uzbekistan, 122 species belonging to 24 genera grow. The leaves are simple, opposite, sessile, with entire margins. The flowers are regular, 4–5-lobed. The calyx may be free or fused. Stamens number 4–10, carpels 1–5, the ovary is superior, and the fruit is a capsule. The family is widespread mainly in the temperate regions of the Northern hemisphere. Species such as Dianthus, Silene, Lychnis, Saponaria and others are ornamental. The roots of species like Gypsophila, Acanthophyllum, Onosma and others are used in the preparation of halva and various beverages. Some species of the Caryophyllaceae family are used in the perfumery industry and medicine. Ten species of Caryophyllaceae are included in the Red Book of the Republic of Uzbekistan. [4]

Table 1. Species of the Caryophyllaceae Family Included in the Red Book of the Republic of Uzbekistan

Uzbek name	Scientific name	Rarity status	Height	Distribution	Life form	Conservation measures
1. Kachimsimon yetmak (bex)	Allochrusa gypsophiloides (Regel) Schischk.	3 – endemic	30–60 cm	Tashkent, Samarkand, Namangan, Jizzakh	Perennial herb	Protected in Surkhan, Kitab, and Chatkal reserves
2.Michelson's silene	Silene michelsonii Preobr.	1 endemic	25–30 cm	Surkhandarya	Perennial herb	Conservation measures not developed

3.Woolly silene	S. tomentella Schischk.	2 – endemic	30–40 cm	Bukhara, Navoi	Perennial herb	Not specially protected
4.Popov's silene	S. popovii Schischk.	2 – endemic	20–25 cm	Samarkand, Kashkadarya, Zarafshan	Perennial herb	Not under special protection
5.Mountain silene	S. oreina Schischk.	1 – endemic	10–15 cm	Samarkand, Kashkadarya, Zarafshan Range	Perennial herb	No special conservation measures
6.Natalia's silene	S. nataliae F.O.Khass.	1 – endemic	3–5 cm	Surkhandarya	Subshrub	Protected in Surkhan Reserve
7.Glandless silene	S. paranadena Bondarenko et Vved.	2 – endemic	30–50 cm	Nurota–Molguzar Ranges (Samarkand, Navoi, Jizzakh)	Perennial herb	Protected in Nurota State Reserve
8.Needle-like white-thorn	Acanthophyllum albidum Schischk.	3 – endemic	30 cm	Fergana, Namangan	Subshrub	Strict protection recommended
9.Awl-leaf white-thorn	A. cyrtostegium Vved.	3 – endemic	20–30 cm	Bukhara, Navoi	Subshrub	Monitoring of populations necessary
10.Uzbekis-tan carnation	Dianthus uzbekistanicus Lincz.	3 – endemic	40 cm	Samarkand, Kashkadarya	Perennial herb	Some populations protected in Kitab State Reserve

Descriptions of Selected Species

1. Kachimsimon yetmak — *Allochrusa gypsophiloides* (Regel) Schischk. A perennial herb, 30–60 cm tall. Stems thin and numerous. Leaves 10–25 mm long, flat, glabrous, and spineless. Flowers pink, arranged in spreading paniculate inflorescences at the top of the stem. Fruit a capsule. Flowering occurs from May to August; fruits ripen in August–September.

2. Mountain silene — *Silene oreina* Schischk. A perennial, many-headed (caudex-forming), densely tufted herb, 10–15 cm tall. Leaf tips elongated and very sharp, covered with dense glandular hairs. Basal leaves are oblanceolate, narrowing toward the base; stem leaves are broader. Flowers white, 1–3 per stem tip. Calyx 2–3 times longer than the corolla, initially cylindrical, later campanulate. Carpophore glabrous. Capsule ovoid. Flowers in May; fruits ripen in May–June.

3. Glandless silene — *Silene paranadena* Bondarenko et Vved. Perennial herb, 30–50 cm tall; stems numerous, woody at the base. Leaves lanceolate, 3–6 cm long, 10–12 mm wide. Flowers solitary at branch tips, large, 30–32 mm long. Petals white to pale pink, deeply bifid. Calyx cylindrical, non-inflated, 22–25 mm long; tube glabrous; teeth with white hairs. Fruit a capsule 10–12 mm long. Flowers April–June; fruits ripen in June. Distribution Notes According to literature sources, the species Allochrusa gypsophiloides, Silene oreina, and Silene paranadena occur in the Molguzar, Nurota, and Turkestan ranges of Jizzakh region. [5, 6]. In the 2009 edition, Allochrusa tadschikistanica Schischk. (Tajik yetmak) was included; however, it is absent from the 2016 and 2019 editions, indicating that the species has likely increased in number or been restored. Dianthus uzbekistanicus Lincz. (Uzbekistan carnation) was not included in the 2009 edition but is present in the 2019 edition, indicating that its population has declined in recent years.

Conclusions 1. In the 2019 edition of the Red Book of the Republic of Uzbekistan, 329 plant species were included. Among them, 10 species belong to the family *(Caryophyllaceae*). 2.

The species *Dianthus uzbekistanicus* (3 – endemic) was included in the 2019 edition. This indicates that the species is currently decreasing in number 3. The species *Allochrusa tadschikistanica*

(3 – endemic) was included in the 2009 edition but omitted from the 2019 edition. This suggests that the species has increased in number or has been successfully propagated. 4.Protecting the species included in the Red Book of the Republic of Uzbekistan, including those belonging to the Caryophyllaceae family, is of great importance for humanity.

Summary: *This article describes the detailed structure of cestodes, including the scolex, neck, proglottids, tegument, and internal organ systems. The morphological features of tapeworms are explained as adaptations to parasitic life in the intestines of vertebrate hosts.*

Key words: *Cestodes, scolex, proglottids, tegument, parasitology.*

INTRODUCTION. Cestodes, commonly known as tapeworms, are obligate parasitic flatworms belonging to the class Cestoda of the phylum Platyhelminthes. They inhabit the intestinal tract of vertebrates, including humans, and cause various parasitic diseases known as cestodiases. The structural organization of cestodes is highly specialized for parasitic life. Their flattened, segmented body and absence of a digestive system represent evolutionary adaptations that allow efficient nutrient absorption from the host's gut. Understanding the morphology and structural features of cestodes is essential for accurate diagnosis, prevention, and treatment of parasitic infections.

MATERIALS AND METHODS. This article is based on comparative morphological analysis of cestodes described in parasitology textbooks, histological samples, and microscopic studies reported in scientific literature. Morphological structures—such as the scolex, neck, proglottids, integument, reproductive system, and excretory system—were examined through published micrographs, anatomical descriptions, and structural diagrams. Literature search was conducted using open-access parasitology journals, WHO publications, and standard diagnostic manuals. All findings were synthesized to obtain a comprehensive description of cestode morphology.

RUSULTS AND DISCUSSION. General Body Structure

Cestodes possess a long, dorsoventrally flattened body that typically consists of three major parts:

1. **Scolex** – the anterior attachment organ;
2. **Neck** – the region generating new segments;
3. **Strobila** – the chain of proglottids forming the segmented body.

Scolex

The scolex enables firm attachment to the intestinal mucosa of the host. Depending on the species, it may contain suckers, rostellar hooks, or both. For example, *Taenia solium* has an armed rostellum, whereas *Taenia saginata* lacks hooks. The scolex does not function as a head but acts primarily as an attachment organ.

Neck Region

Immediately behind the scolex, the neck is a narrow, unsegmented zone responsible for generating new proglottids by asexual budding. This region is metabolically active and contributes to continuous growth of the strobila.

Proglottids and Strobila

The strobila consists of numerous proglottids arranged linearly. Proglottids mature as they move posteriorly:

- **Immature proglottids** near the neck contain developing organs.
- **Mature proglottids** contain fully developed male and female reproductive systems, making cestodes hermaphroditic.
- **Gravid proglottids** at the posterior end are filled with fertilized eggs and are released into the environment.

Tegument

Cestodes lack an alimentary canal and rely entirely on absorption through their tegument. The surface is covered with microtriches — microscopic projections increasing surface area and enhancing absorption. The tegument also protects the worm from digestive enzymes and host immune responses.

Reproductive System

Cestodes are highly prolific organisms. Each mature proglottid contains a complete hermaphroditic system:

- **Male organs** include multiple testes, vas deferens, and cirrus.
- **Female organs** include ovary, oviduct, uterus, vitelline glands, and Mehlis' gland.

Self-fertilization is most common, although cross-fertilization between proglottids also occurs.

Excretory and Nervous System

The excretory system is based on protonephridial flame cells and longitudinal excretory canals.

The nervous system consists of paired longitudinal nerve cords connected by transverse commissures. The scolex contains the main concentration of nerve ganglia.

Adaptations to Parasitic Lifestyle

Cestodes demonstrate pronounced morphological adaptations:

- absence of digestive system,
- highly developed reproductive structures,
- strong attachment organs,
- protective tegument with microtriches,
- ability to produce numerous eggs.

These adaptations ensure successful survival inside the host and transmission to the next host.

CONCLUSIONS. The structural organization of cestodes reflects their complete adaptation to parasitism. Their segmented body, specialized scolex, reproductive efficiency, and absorptive tegument are key features enabling survival in the intestinal environment. Understanding the morphology of cestodes provides a foundation for improved diagnostic techniques, epidemiological studies, and the development of effective control measures for tapeworm infections.

PROBLEMS OF THE ARAL SEA AND ITS SURROUNDING REGION

Pirniyazov S.K.
Karakalpak State University named after Berdakh

Summary: *This article examines the problems of the Aral Sea and its surrounding region.*
Keywords: *coastal zone, ecological disaster, drinking water, Muynak, Aral Sea region.*

The global community is deeply concerned about the worsening environmental situation in the Aral Sea and the surrounding Aral region. The Aral crisis is one of the largest regional environmental disasters, affecting the lives of more than 35 million people living in the sea basin, including a significant portion of the population of Uzbekistan.

The Aral Sea, which until recently was considered one of the largest lakes in the world, is rapidly drying up. The main cause of the Aral Sea's desiccation has been the sharp reduction in water inflow as a result of diverting the waters of the Amu Darya and Syr Darya rivers for irrigation purposes. The expansion of irrigated land in Central Asia and the inefficient use of water resources predetermined the fate of the Aral Sea.

Over the past 40–45 years, the sea level has fallen by 22 meters (from 53 meters in 1961), while the volume of water has decreased from 1,064 km³ to 115 km³. As a result, salt flats and shifting sands have formed in its former basin. By the end of 2004, the sea level was recorded at an absolute height of 28.5 meters, and approximately 45,000 km² of its surface area had dried up and turned into land.

While the long-term average salinity of seawater had previously been 9–11 g/l, it has now exceeded 72 g/l. Consequently, the Aral Sea has lost its significance as a biologically productive water body. Biological diversity has sharply declined: the number of animal species in the marine region has decreased from 174 to 38.

The drying of the Aral Sea has led to a serious deterioration of the socio-ecological situation in the Aral Sea region. Each year, between 15 and 75 million tons of salt and dust rise from the dried seabed, causing extensive pollution of the air and soils over vast territories. In the Aral Sea region, the pace of both natural and anthropogenic desertification is increasing. The salt content of drinking water ranges from 2 to 4 g/l, while water consumption in some areas does not exceed 5 liters per person per day (compared to the norm of 200–300 liters). Morbidity and mortality rates among the population have reached high levels.

The possibility of restoring the Aral Sea to its original state has already been lost. Under present conditions, it is impossible to maintain the former water level of the Aral Sea. The establishment of artificial forests on the dried seabed is of great importance in combating wind-driven sand and salt transport. Since 1981, trees and shrubs such as white and "black saxaul", "kandym", "cherkes", and other plant species have been planted on the dried areas of the sea, yielding positive results.

At present, forests covering an area of about 25,000 hectares are established annually. However, newly exposed seabed areas are covered with salt, where vegetation may not grow at all. The countries of Central Asia are cooperating in addressing the problems of the Aral Sea and the surrounding region.

The United States, Japan, Germany, France, and other developed countries, as well as the United Nations, the World Bank, and various governmental and non-governmental international organizations, are contributing to positive solutions to this problem of the century [1, pp. 86–88].

Figure 1

Figure 2

Local residents, observing the retreat of the sea, recall that they used to stick poles into the shoreline and then return some time later to see how far the sea had receded. As the volume of water decreased, salt concentrations increased, and the Aral Sea began to turn into a toxic body of water. Today, 90% of the former territory of the Aral Sea is desert—an area comparable in size to Ireland. The death of the sea changed not only people's way of life but also the regional climate.

When physician Yoldoshboy Dosimov arrived to work at the Muynak hospital in the 1980s, the sea had already retreated dozens of kilometers from its former shoreline. He vividly recalls the diseases that became more widespread during those years. "Respiratory and kidney diseases were common, as well as tuberculosis. Until recently, many children died from diarrhea." When the Aral Sea dried up, winds began to carry salts from the vast desert that had formed in its place over hundreds of kilometers.

According to specialists, more than 100–150 million tons of dust and salt are lifted into the atmosphere each year from the desert formed on the former seabed, leading to increased illness among the population of the Aral Sea region. In particular, the incidence of various cancers rose, and diseases of the lungs and heart became more frequent. By the 1990s, infant mortality in Karakalpakstan was higher than in other regions. However, the problems of the Aral Sea, which had been widely and thoroughly discussed in the late 1980s, were once again largely forgotten in the 1990s. More precisely, the issue was addressed only in connection with occasional conferences or events [3].

The territory of the Aral Sea has completely gone out of human control and has been declared an environmentally unfavorable zone. In this region, the ecological and reclamation condition of soils has deteriorated sharply; every year the area of highly saline lands increases, leading to complex economic and social problems. Not only agriculture suffers from this process, but also ancient archaeological monuments. High-voltage power lines and the foundations of transmission towers are severely damaged as well, and their repair requires significant financial and labor resources.

If until recently there were about 50 historical monuments in the Ellikkala district, today only around 30 remain. In the Turtkul district, the ancient settlement of **Koikyrilgan Kala,** built in the 4th century BC and believed to have functioned as an observatory, has completely disappeared [1].

At present, Uzbekistan is well aware of the scale and consequences of the problem. In particular, it has become evident that the Aral Sea can no longer be saved or restored, and the main task for Uzbekistan has become preserving life in the Aral Sea region. A globally unprecedented experience is being implemented: Uzbekistan is transforming the dried bottom of the Aral Sea into a forest. Uzbek scientists appear to have found a solution to the ecological catastrophe.

In the desert, several hundred kilometers from Muynak, people begin work early in the morning. Forty years ago, these areas were the seabed at a depth of 25–30 meters. Today, piercing winds blow, and everything around appears white from small shells and salt. Saxaul trees prevent the wind-driven dispersal of dust and salt from the soil.

Figure 3

Figure 4

As a result, the rise of toxic salts from the bottom of the Aral Sea into the atmosphere will be reduced. At present, one seventh of the Aral Sea bed within Uzbekistan, or about 500,000 hectares, has been transformed into saxaul forest. Alongside these trees, various grasses and other plant species can also be observed.

Saxaul is planted in rows, with a distance of 10 meters left between adjacent rows. This is done because when saxaul grows, its seeds disperse around the area, allowing new shoots to sprout in the spaces between the rows. Within a few years, the previously bare land becomes covered with new trees. However, the extremely arid climate, lack of precipitation, and in some cases excessive concentrations of toxic salts in the soil hinder the survival of saxaul. In certain areas, only 20–25% of the seedlings survive.

Currently, research is also being conducted to improve the resilience and survival rate of the trees. Nevertheless, today about 500,000 hectares of desert on the Uzbek side of the dried Aral Sea have been transformed into forests of saxaul and tamarisk. This is a globally unprecedented experiment that is difficult to believe. However, approximately 3 million hectares of the former seabed still remain open desert.

If afforestation continues at the current pace, it will take another 150 years to convert the remaining area into forest. Transforming the seabed into forest in order to preserve life around the Aral Sea has effectively been chosen as the most cost-effective, practical, and accessible measure. Even so, planting saxaul on 18–20 thousand hectares annually requires about 5–7 million (USD).

The burden of addressing the consequences of this massive ecological catastrophe inherited from the Soviet period lies primarily with Uzbekistan and Kazakhstan. At present, most of the funding is provided by the Government of Uzbekistan. As saxaul forests expand, many residents of Karakalpakstan are once again beginning to look toward the future with hope [2].

Figure 5

Figure 6

In some foreign countries (Germany, Israel, and the United States), hydroponic methods are used in horticulture and in the creation of miniature architectural gardens. Hydroponics is a method of cultivating various vegetables, melon crops, flowers, and gardens without soil, using nutrient solutions instead. Such gardens are the result of combining intelligent agrotechnologies for plant care with modern planting techniques.

A hydroponic garden makes it possible to grow plants and obtain fruits and vegetables even in areas without soil, for example, in open courtyards or enclosed spaces, in suspended garden structures, on vertical walls, and in special containers. Plants grow rapidly, bloom, and bear fruit visibly within a short period of time. Low-growing plant varieties are selected for planting.

Among vegetables, cherry tomatoes are commonly grown; among leafy crops: spinach, iceberg lettuce, coriander, and water spinach; among herbs: basil, coriander leaves, licorice (a leguminous plant), and mint. Among flowering plants: periwinkle, begonia (a decorative plant with small flowers), chrysanthemums, lavender, verbena, petunia, dandelion, saxifrage, and others. Among bulbous plants: daffodils, gladiolus, large-flowered canna, dahlia, tulip, hyacinth, agapanthus, cornflower, saffron, lotus, and others.

The hydroponic method allows plants to be supplied with essential nutrients at the required time and ensures effective plant care. Compared to traditional horticulture and melon cultivation, this method significantly reduces land and water consumption. In addition, fertilizers do not enter natural water bodies and are not wasted, as often occurs in conventional agricultural practices. Today, hydroponics is widely used in Europe as a landscape-forming system [4].

Summary: *The article examines the distinctive characteristics of Mesozoic deposits in Western Uzbekistan and the current state of their distribution zonality. Groundwater plays a crucial role in the formation and preservation of oil and gas accumulations. Under certain conditions, it can contribute to either their accumulation or destruction. Therefore, the purpose of this research is to determine the role of reservoir properties and groundwater in the formation and distribution of hydrocarbons in the Mesozoic deposits of Western Uzbekistan. In this work, a comprehensive approach was applied to address problems involving the scientific synthesis of factual data from the Jurassic and Cretaceous sedimentary layers in the studied area. This approach incorporated materials that characterize various parameters within these geological strata. In conclusion, the oil and gas potential of the study area has been evaluated based on various criteria, and the findings are presented.*

From a general geological perspective, considering the characteristics of oil and gas formation, as well as the dynamics and chemical unity of reservoir fluids, is an important criterion for oil and gas exploration. This factor deserves attention when selecting a rational approach to geological exploration work. Based on the geological analysis of Jurassic and Cretaceous deposits in the studied area, various zones were identified along with their corresponding areas of high potential for oil and gas. Identifying such local areas within the studied territory significantly expands the range of potential exploration targets, which will enable increasing the effectiveness of prospecting and exploration work in the future.

Key words: *geological, deposits, formation water, pressurized water system, mineralization, horizon, fluid, mine, migration, Jurassic, Cretaceous, Mezozoic.*

INTRODUCTION

In the oil and gas industry, studying the chemical composition of formation waters is one of the main issues. Its significance lies in the fact that this composition substantially reflects the underground conditions in general and the influence of hydrocarbon (UV) accumulations in particular. True, the relative importance of some components in the chemical composition of waters is not the same. If in the early stages of hydrogeological development, the study of the ionic-salt composition of formation waters occupied a central place, now much attention is paid to the determination of the dissolved, gaseous, organic, and microcomponent composition of water, as well as the general hydrochemical zonality of fluids, as components associated with the components of UV deposits [2, 5].

Accordingly, the targeted objective of the research is to determine the hydrogeochemical characteristics of groundwater in the Mesozoic deposits of Western Uzbekistan and to identify their role in the formation and distribution of UV accumulations.

From a hydrogeological point of view, the considered territory occupies the northeastern part of the Amu Darya water-pressure system, bounded in the north and south by the South Kyzylkum and Amu Darya faults, and in the east and southeast by the mountain structures of the Hissar and Karatepa systems (Fig. 1). Within the considered territory, three hydrogeological regions are distinguished by structural-пpetectonic, lithological-facies, and hydrogeological conditions: Bukhara, Chardzhou, and Beshkent-Kashkadarya [12].

Degree of study of the problem and research methods. The structure of the Mesozoic aquifer system of Western Uzbekistan has been studied in considerable detail to date. The initial data

about it is based on hydrochemical information indicating a significant difference in the formation waters of Jurassic and Cretaceous deposits between exploration areas and explored hydrocarbon raw material deposits (Korsakov, Dikenstein, Zaydelson).

The study of the lithology of the sedimentary cover, the reservoir properties of rocks, and the hydrogeological conditions of the exploration areas of the studied territory made it possible to substantiate the independence of the Jurassic, Neocomian-Apthian, Cenomanian-9пегAlbian, and Cenon-Paleocene (Nadturonian) aquifer complexes (V.A. Kudryakov, T.N. Avazov, S. Talipov) [7]. These ideas, later reinforced with new factual material, received general recognition (A.A. Karsev et al., Ya.A. Khodzhakuliyev, I.V. Kushnirov [13], G.P. Yakobson et al., A.S. Panchenko, G.A. Arzhevsky, V.N. Pashkovsky, V.A. Kudryakov) [6, 10].

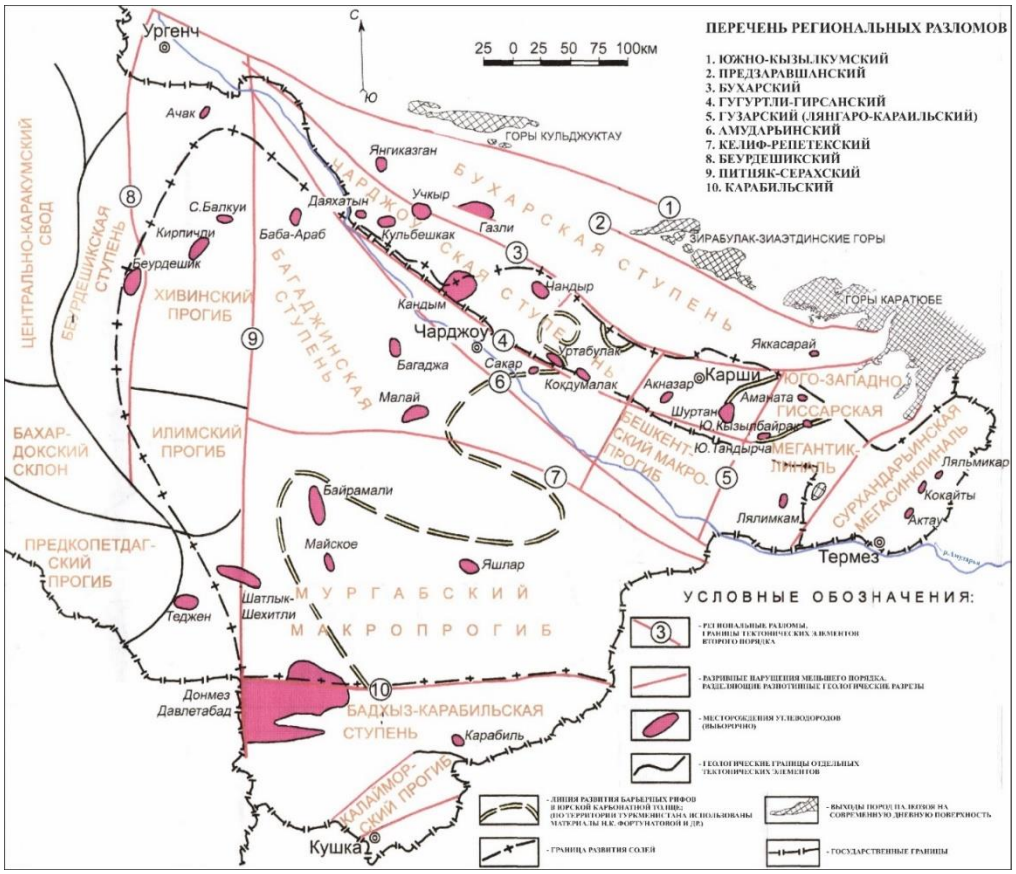

Figure 1. Scheme of hydrogeological zoning of the northeastern part of the Amudarya oil and gas basin

Admittedly, there have been attempts to determine the names of water pressure complexes, which is associated with disagreements regarding the stratigraphic age of individual sections of the section. For example, L.E. Mikhailov and V.V.Pechernikov spoke about the neocomian-apt-lower alb and upper alb-senomanian water-pressure complexes, while G.A. Arzhevsky determined the age of the clays of the acanthoplite suite by the upper apt age, using the name of the upper aptian water barrier instead of the lower albian. V.A. Kudryakov, Ya.A. Khodzhakaliev, and I.V. Kushnirov called the Neocomian-Aptian complex the Lower Cretaceous complex [7, 10].

V.N.Korsenshtein considered the lower albian, middle-upper albian, and Cenomanian aquifers as partially isolated complexes [4]. In areas without Jurassic water pressure, the lower part of the aquifer system was assessed differently as a combination of Jurassic and Lower Cretaceous complexes (T.N. Avazov) and an independent Jurassic-Lower Cretaceous complex (I.V. Kushnirov) [1, 8].

Consequently, over the entire period of research, no significant change in views on the structure of the water pressure system is observed. Previously existing concepts changed only

quantitatively, by attracting newly explored areas and new types of hydrogeological data to the research object. All this allows us to limit ourselves to a brief overview of the most important features of water-pressure complexes and waterproof structures.

Of the numerous studies characterizing the evolution of ideas about the hydrogeochemical zonality of Western Uzbekistan, the generalizing scientific reports and publications of V.V.Kolodiy, L.E.Mikhailov, V.N.Korsenshteyn, V.A.Kudryakov, E.A.Bars, Ya.A.Khodzhakulyov, V.N.Pashkovsky, S.Kholdarov, S.Talipov, T.N.Avazov, S.A.Bakiyev, T.Kh.Shoymurotov, and others deserve special attention.

In the overall set of studies, the main features of the formation of oil and gas deposits as components of natural water pressure systems were identified: the connection of the processes of formation and decomposition of hydrocarbon accumulations with water-saturated rocks, the dependence of the preservation of hydrocarbon deposits on modern and ancient hydrogeological conditions, as well as the significance of various components of the chemical composition of groundwater for oil and gas exploration.

At the same time, a number of important issues of oil and gas hydrogeology remain underdeveloped and controversial. In particular, there is no unified understanding of natural water pressure systems and the classification of identified hydrodynamic anomalies. The problem of hydrochemical zoning of groundwater in the lower horizons of the sedimentary section and their interrelationship has not been sufficiently studied. The determination of vertical and lateral zonality of the Jurassic and Cretaceous aquifer complexes of Western Uzbekistan is episodic and is currently poorly studied [16].

Currently, there is a large amount of data on the composition of formation waters in the studied territory, the analysis of which allows for a largely new understanding of the structure of the hydrogeochemical field and the mechanism of formation and distribution of groundwater. In recent years, qualitative and quantitative changes have occurred in hydrogeological studies of the studied territory, associated with the expansion of the use of probabilistic-statistical methods of system analysis in the study of hydrogeological phenomena and processes. Information-search systems of digital three-dimensional modeling, taking into account modern achievements in the field of hydrogeology and the foundations of traditional methods of processing and analyzing hydrogeological data, are being introduced into the practice of hydrogeological works. It is on this basis that all subsequent studies were carried out for a detailed study of hydrogeological structures using additional approaches and indicators of the studied territory.

In the study, a comprehensive approach was applied to solving problems, including the scientific generalization of factual data in the section of Jurassic and Cretaceous deposits of the studied territory, with the involvement of materials characterizing the flow, reservoir pressure, temperature, and macro- and microcomponent composition of reservoir waters.

Main Part. Thus, the Mesozoic deposits of Western Uzbekistan encompass numerous aquifers, dissected by Jurassic and Cretaceous deposits. The water-resistant basis for them is mainly metamorphic and igneous rocks of the Paleozoic basement, located at depths from 3.0-3.5 km to 5.0-5.5 km. The considered aquifers, due to the presence in the section of neocomian-upper Jurassic, lower Albian, and lower Turan aquifers, are combined into Jurassic and Cretaceous (Neocomian-Aptian, Albian-Cenomanian, Senonian-Paleocene) water-pressure complexes (Fig. 2).

Isolated confined aquifer complexes unite the following aquifer horizons: Jurassic XX-XVII (terrigenous formation) and XVI-XV horizons (carbonate formation), as well as Cretaceous - XIV-XII (Neocomian-Apthian), XI-IX (Alb-Cenomanian), VIII-VII (Cenon-Paleocene) terrigenous pachks. In the extreme northwestern part of the Bukhara Steppe (Gazli, Meshekli, Yangikazgan, and other districts), the Lower Cretaceous aquifer complex combines with the Jurassic aquifer complex, forming a single Jurassic-Lower Cretaceous aquifer complex [12].

The groundwater of the Jurassic deposits of the territory is associated with the sand-alveolar terrigenous collectors of the Lower-Middle Jurassic period and the carbonate collectors of the Callovian-Kimmeridgian period. It is possible that sporadically developed permeable horizons,

discovered in the Farob, Saritash, Pamuk, and other areas of Permian-Triassic age, should also be included here, the thickness of the latter sometimes reaches the first hundred meters.

The sand-silt horizons (XX-XVII) of the Lower-Middle Jurassic terrigenous formation (TF) are very unstable in area and cross-section, as well as in reservoir characteristics, even within local sections. The thickness of the stratum varies from hundreds of meters in the Chardzhou step to a wide range of complete fractures in the northwestern part of the Bukhara step (Pitnyak, Gazli uplifts). Sections corresponding to the Saritash-Shurtepa, Karabair-Andabazar, and other uplifts are bounded by isolines with a thickness of 100 m and 200 m. The porosity (m) of rocks varies from 5% to 12%, and the permeability (k) from 10 to 200 millidarsi (mD).

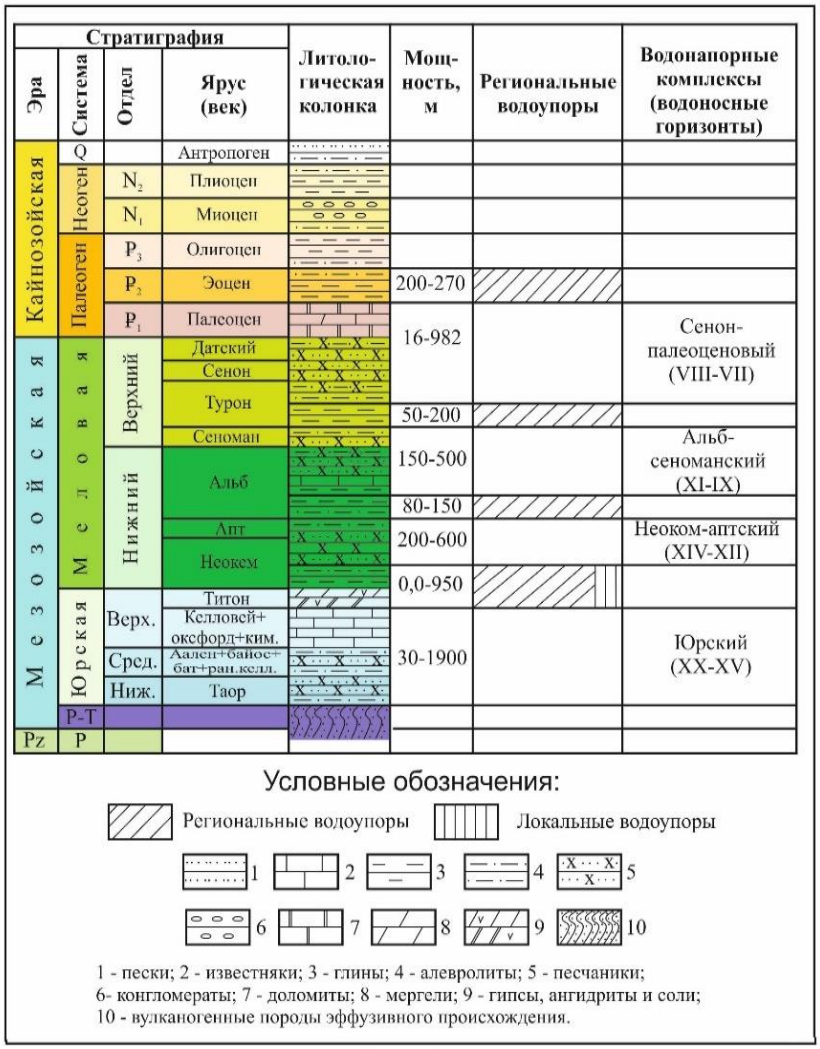

Figure 2. Structural diagram of the Jurassic and Cretaceous aquifer complexes of the Bukhara-Khiva oil and gas region

An increase in thickness is observed in the southwestern direction - from 300 m in the zone of the Bukhara deep fault, up to 1000 m and more in the territory of the Kimerek graben. However, in the southwestern direction, the increase in the thickness of the deposits is not accompanied by an increase in the volume of reservoirs due to the silting of the section. In the Chardzhou Stage, the TF is fully studied at the Khodzhikazgan, Dayahatyn, Hakkul, Urtabulak, Kokdmalak, and other deposits, where the permeable core, consisting of coarse-grained sandstone, accounts for 30.9% of all outflow. The reservoir type in sandstones is granular. The maximum pore size is up to 1 mm. The average porosity values are 12.4%, and the permeability is 62 mD.

The Jurassic Carbonate Formation (KF) is distributed over most of the region, with the exception of the Pitnak uplift and the eastern part of the Gazli uplift (horizons XVI and XV). In the

southwestern and southeastern directions, an increase in the thickness of carbonate deposits to 300-400 m is observed. Characteristic features of this part of the aquifer complex are the presence of dense clay limestones with anhydrite layers of the XVa horizon on the Mubarek uplift and the southern slope of the Kagan uplift (between the XVI and XV horizons), consisting of weakly cemented (loose) limestones, as well as the presence of organogenic limestones on some areas of the Chardzhou step (Kultak, Pamuk uplifts, etc.) above the KF. The proportion of reservoir rocks in the volume of KF is estimated on the order of 40%, while reservoirs of a porous type are practically absent in the lower part of the formation. Average porosity values of rocks are 12-16%, permeability 4-20 mD. Collectors with the highest capacity and permeability correspond to rifogenic structures.

The biohermic structure of the complex consists of fractured-cavernous, porous, medium-strength clastic-algal limestones. Purely porous differences are more widespread than in the deposits of the overlying horizons of the Chardzhou Stage and the Beshkent Macropogib. Below the section (under the XV reef horizon), dense gray fine-grained limestones with varying amounts of organogenic detritus, made of carbonaceous material, are noted. The Upper Jurassic part of the Bukhara-Khiva Mesozoic section is crowned by a thick (southeast), but gradually thinning (to complete fracturing in the west), evaporite formation (EF) of Kimmeridge-Titon, consisting of gypsum, anhydrites, rock, and potassium salts. The total thickness of the Jurassic aquifer does not exceed 400 m on the Bukhara Stage, 1000 m and more on the Chardzhou Stage and the Beshkent Macropogib.

The Upper Jurassic aquifer consists of alternating layers of clays of the Neocomian Karabil Formation and gypsum, anhydrite, rock, and potassium salts of the Gaurdak Formation of the Titonian Stage. Its structure is significantly variable in lithology and thickness. On the Bukhara Stage, this is mainly an anhydrite layer, which decreases and disappears on the southern slopes of the Gazli uplift and the northern slopes of the Kagan uplift. In the southwestern direction, the thickness of the anhydrites increases, and halite packs appear. In the Chardzhou Stage and the Beshkent Macropogib, the impermeable layer consists of halite and anhydrites, which have subordinate significance. The thickness of this regional water barrier varies from 25 m and less in the northeastern part of the Bukhara Stage to 500-700 and 950 m in the Chardzhou Stage and the Beshkent Macropogib, respectively. The increase in waterproof thickness occurs both due to halite and due to the claying of the lower part of the carabile suite.

The Neocomian-Aptian aquifer complex unites the XIV-XII sandy horizons of the Turanian-type red molasse formation. It consists mainly of red sandstones, siltstones, and clays, and is stratified with several unstable horizons along the strike of pebble conglomerates. Approximately in the middle part of this layer, almost everywhere, a suite of sandy-alveolar rocks is located, containing layers of limestones, sometimes shell-shaped rocks, covered with gray and brownish-red clays. This part of the Red Formation is currently identified as the 13th productive horizon. Unlike all other productive horizons of the Cretaceous section, the XIII horizon contains more oil-gas or oil accumulations. Clay rocks, marls and limestones, and sometimes anhydrite layers predominate on the Chardzhou Stage. The reservoir properties of the rocks are very poor in the Chardzhou stage (m = 10-12%, k < 10 mD) and significantly improve during the transition to the Bukhara stage (m up to 24%, k up to 100-500 mD). Sandstones in the Gazli deposit area are particularly characterized by high permeability (up to 1000 mD). Above this layer, across the entire territory of the studied region, gray and greenish-gray glauconite sandstones are observed, which sometimes contain layers of pebbly conglomerates or mixtures of pebbles, in the middle of which there are accumulations of greenish-gray, gray, and almost black clays. This sand mass is distinguished as the XII productive horizon, with the deposits of which the unique Gazli deposit and large industrial gas occurrences in the structures of the Kagan and Mubarek uplifts are associated. This productive horizon is one of the most stable. The thickness of the Neokom-apt aquifer complex is 200-250 m on the Bukhara Stage and reaches 600 m on the Chardzhou Stage [15].

The Lower Albian water-retaining layer consists of a thick homogeneous clay layer of the acanthoplite formation, which is an analogue of the Karakuz Suite in the southwestern branches of the Gissar Range, forming the lower part of the terrigenous-glauconite formation. This layer is quite stable in terms of lithological composition and thickness, the latter being approximately 80 m in the

Bukhara and 150 m in the Chardzhou steppes. It should be noted that in the lower part of the clay layer section, there are small layers (30-50 cm) of brown sandy rocks, which are distinguished as benchmark horizons.

The Albian-Cenoman aquifer complex includes the XI-IX horizons of the middle part of the terrigenous-glauconite formation, consisting of gray, green, and significantly less often red clays, sandstones, and sands, and includes limestone-shell, clay-shell, and less frequently limestone layers almost throughout the section. In the upper part of the Albanian deposits lies a collection of sandstones, containing layers of limestone-shell and gray clay. This is the so-called XI horizon, on which there are also gas fields of industrial importance in many areas. Cenomanian deposits are composed of sandstones and clays, which have undergone repeated changes. In some areas, in addition, individual layers of limestones and shell limestones are also found. Below the Cenomanian, the X horizon is distinguished, and above it, the IX horizon. Both of them are composed mainly of sandstone and sand. In general, aquifers in the Bukhara stage have very good reservoir properties (m up to 30%, k up to 1000 mD and higher). In the direction of the Chardzhou step and the Kyzylkum foothill dome, the reservoir properties of the rocks deteriorate due to the claying of the section in the southwestern direction and the lack of rock sorting in the northeastern direction. The permeability of rocks decreases sharply (up to 10-100 mD), while the porosity content remains significantly higher at the boundary of the Kyzylkum Basin (25%) and decreases at the Chardzhou Stage (up to 15%). The thickness of the complex increases from 150 m on the Bukhara stage to 500 m on the Chardzhou stage.

A characteristic feature of the material composition of Alb-Cenomanian deposits (XI-IX horizons) is the almost constant enrichment of sandy rocks with glauconite, and clays with sulfide compounds of iron and dispersed bitumens. Above the IX horizon lies a clay-sandy patch with layers of sandstone, covering a large part of the Turanian deposits and the Senonian.

The Lower Turan aquifer is composed of well-preserved clay deposits in terms of thickness and lithology. A gradual increase in thickness (from 50-70 m to 200 m) and the replacement of lumpy material with increasingly fine-grained material occurs in the southwestern direction.

The aquifers of the Cenon-Paleocene (VIII-VII) deposits, located between the Lower Turan and Eocene aquifers, are characterized by a variety of lithological compositions of rocks: mainly terrigenous - in the lower part and carbonate - in the upper part. These horizons are drained by numerous wells and structural boreholes, and in a number of regions, they are exposed to the surface. These horizons are closely related to groundwater and are often characterized by the non-pressurized nature of formation waters. In the southwestern (Chardzhou Stage) and southeastern directions (Beshkent Macropogib), the thickness of the complex and the clay content of the section increase.

The waterproof covering of the Mesozoic confined aquifer system of Western Uzbekistan is a regionally preserved clay layer of the Eocene period (Suzak, Alai, and Turkestan layers). In the highest elevations of the Bukhara Stage, these deposits are not found. Their thickness reaches 200-270 m on the Chardzhou Stage and 270 m on the Beshkent Macropogib.

Thus, the features of the structure of the Mesozoic aquifer system of Western Uzbekistan are as follows: an increase in the volume of the aquifer system in the southwestern direction due to the increase in the clay part of the section and the formation of a halite layer; the presence of regional impermeable and aquifers; the reservoir properties of rocks are highest in the central part of the region and have a downward tendency to deteriorate along the section; the reservoir properties of rocks are closely related to lithological-facies zonality. The summary geofiltration scheme of the hydrogeological section of the Mesozoic Formation in the study area is presented in Table 1.

Table 1

Geofiltration scheme of the hydrogeological section of Mesozoic deposits of Western Uzbekistan

Age of sediments	Elements of the hydrogeological section	Capacity, m	Litological composition	Average mineralization, (g/l) and water type

Eocene (P_2)	Unevenly distributed waterproofing	200-270	Bentonite-like clays of gray and dark gray color	
Senon-Paleocene (K_2-P_1)	Senon-Paleocene aquifer complex (VIII-VII)	16 - 982	Sandstones, carbonate rocks, gypsum and anhydrites	0,8-22,0 SN
Lower Turon (K_2 t)	Regional water barrier	50 - 200	Bentonite-like clays of dark gray and greenish-gray color	
Alb-senoman (K_1 alb-K_2 cm)	Albian-Senomanian aquifer complex (XI-IX)	150 - 500	Sandstones, glauconite sands, siltstones, clays with layers of conglomerates and gravels	1,6 – 145,0 GKN, SN, XK
Lower alb (K_1 alb)	Regionally maintained waterproofing	80 - 150	Argillite-like clays of dark gray color with sparse layers of siltstones and sandstones	
Neokom-apt (K_1 ne-apt)	Neokom-apt aquifer complex (XIV-XIII-XII)	200 - 600	Sandstones, siltstones with clay layers	2,0 – 157,0 SN, CM, XK
Gaurdak Suite (J_1 tit) Carabyl Suite (K_1 ne)	Upper Jurassic (Neocomian-Upper Jurassic) water barrier	0,0 - 950	Anhydrites, gypsum, rock and potassium salts	
Jurassic (J)	Jurassic water-pressure complex (XX-XV)	30 - 1900	Sand-aleurolithic rocks with layers of clays, sandstones, and limestones	4,0 -219,0 XK

Note: Water type: SN -sulfate-sodium; GKN-sodium bicarbonate; CM - chloride-magnesium; XK - calcium chloride.

Research results. The compiled hydrochemical maps of the Jurassic and Cretaceous aquifer complexes of Western Uzbekistan indicate that the distribution of groundwater in the western and northwestern directions has a very complex character with a tendency to change their chemical composition. In the southwestern and northwestern directions of the Bukhara-Khiva oil and gas region (in the direction of the Kulbeshkak uplift), groundwater is characterized by great diversity, both in genetic type and composition (mineralization from 1 to 335 g/l, in some cases up to 400 g/l and more). The general trend of growth in groundwater mineralization along the regional subsidence of the layers from the Bukhara Stage to the Chardzhou Stage is clearly expressed in the Neocomian-Aptian and Upper Jurassic deposits [9, 10, 15].

The water content of the Lower-Middle Jurassic (J1-2) deposits of the studied territory is associated with the sand-silt horizons (XX-XVII) of the terrigenous formation (TF), and their hydrochemical properties are characterized by the following features (Fig. 3).

To the north of the Bukhara Steppe, in the areas of Jurassic deposits, a narrow zone with a mineralization of less than 50 g/l is observed, in which saline waters of mixed genetic type (44.0 g/l of the Karnabchul Plain, 16.2 g/l of the Maydazhay Plain) with varying degrees of metamorphism are distributed. A gradual increase in mineralization is observed in the southwestern direction and along the section. Small concentrations of iodine, bromine, and ammonium were noted, respectively - up to 5, 50, 60 mg/l (according to the classification of V.A.Sulin).

The hydrochemical zone of brines with a mineralization of 50-100 g/l extends parallel to the above-described zone, covering almost the entire territory of the Bukhara Steppe, the northern parts of the Gazli, Kagan, Mubarek uplifts and the Rometan, Kashkadarya basins, as well as the central part of the Azlyartepa dislocation zone.

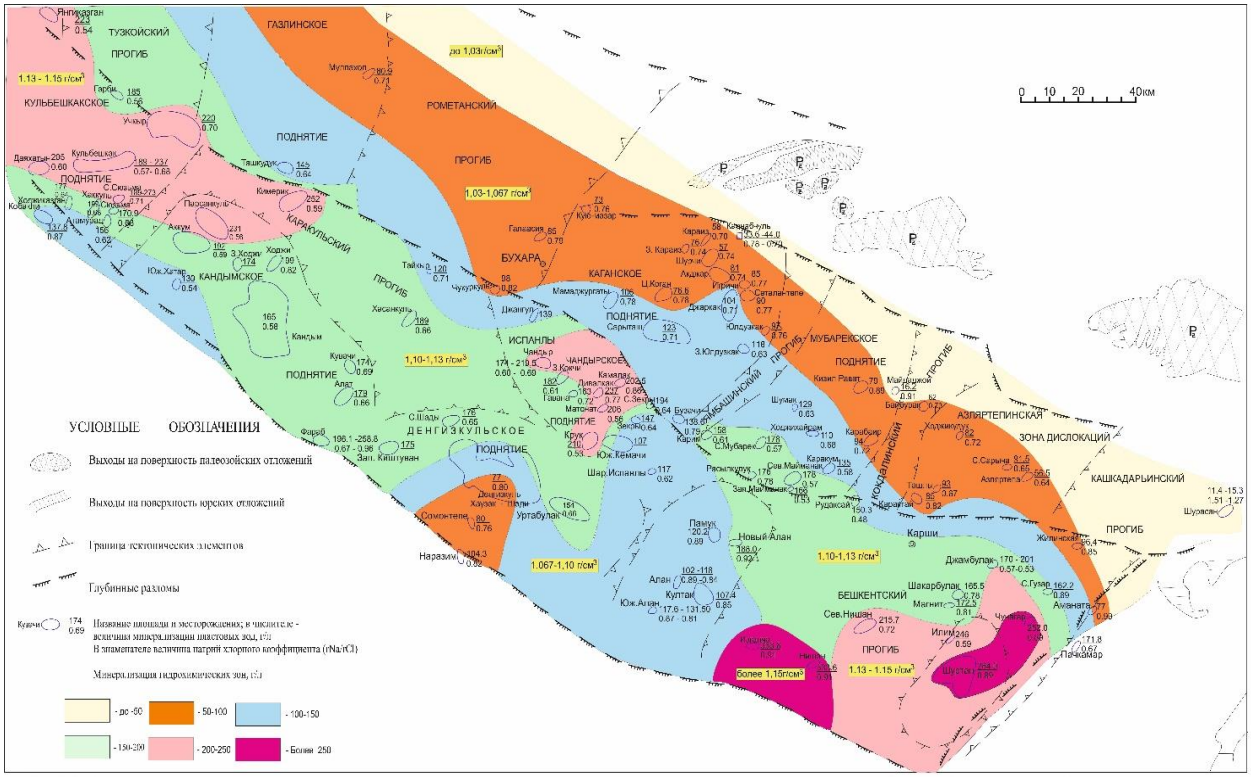

Figure 3. Schematic map of the hydrochemical zoning of groundwater of the Lower-Middle Jurassic deposits of Western Uzbekistan

Formation waters are metamorphosed (0.64-0.85), chloride-calcium type.

The hydrochemical zone with mineralization of 100-150 g/l is distributed in the Mubarek (Karakum area - 135 g/l, Khojaykhairom area - 110 g/l, Shumak area - 129 g/l), Kagan (Saritash area - 123 g/l, Mamazhurgati area - 106 g/l, West Yulduzkak area - 118 g/l) and Gazli (Tashkuduk area - 145 g/l) uplifts of the Bukhara Steppe, as well as in the Kultak uplift area of the Chardzhou Steppe (Kultak area - 107 g/l, Olon area - 118 g/l, South Olon - 131 g/l, Pamyk - 118 g/l). The presence of these zones may be associated with the penetration of bound waters from clay deposits into reservoirs under the influence of high geostatic pressures. These waters are metamorphosed (0.57-0.70) and belong to the chloride-calcium type.

Similarly, the distribution of low-mineralized waters (50-100 g/l) in the hydrochemical zone of 100-150 and more is observed in the Ispanli-Chandyr deposits (Northern Ispanli-117 g/l, Zekri-147 g/l, South. Kemachi-107 g/l), Dengizkul (Dengizkul-77 g/l, Samontepa-80.0 g/l) and Kandym uplifts (Jan. Hazard - 130 g/l). The phenomenon of a slight decrease in the mineralization of formation waters in the transboundary sections of gas condensate reservoirs can be explained by the presence of a mixture of condensation waters.

The distribution of highly mineralized waters mainly occurs in the central Ispanli-Chandyr (Matonat-206 g/l, Kruk-210 g/l, Chandyr-219,5 g/l, Divalkak-237 g/l), Kandym (Farab-258.8 g/l, Haji-199 g/l, Parsankul-231 g/l) and Kulbeshkak (Hakkul-199 g/l, Kulbeshkak-237 g/l, Dayakhatin-205 g/l, Shim. Syzma-273 g/l, Uchkir-220 g/l) and the Karakul Depression (Kimerek-252 g/l). The metamorphism coefficient varies from 0.53 to 0.96, and a very low sulfate content of 0.005-0.00006 is observed. The type of water is chloride-calcium.

In the Lower-Middle Jurassic deposits of the Beshkent macropoligon, there are mainly highly mineralized chloride-calcium groundwater with mineralization of 100-150 g/l, 150-200 g/l and higher. At the same time, in the central part of the fold, mineralized formation waters were recorded in the areas of Alachavan, Bozbichkon, Iymon, and Shimoliy Aknazar, respectively - 104.7 g/l, 113.6 g/l, 121.8 g/l, 121.2 g/l. And in the northern mines. Guzar, Shakarbulak, Shim. In Nishan, Ilim, the distribution of formation waters with mineralization from 162.2 g/l to 246.0 g/l has been established,

which are structurally and tectonically located in the Guzar, Shurtan, Nishan uplifts, Shakarbulak, and Kamashi valleys.

Against the background of the general trend of mineralization and metamorphism of formation waters in the direction of the southern bend, highly mineralized (more than 250 g/l) and metamorphosed waters developed in individual areas. The hydrochemical zone with mineralization above 250 g/l covers the areas of the Shurtan-284.0 g/l, Nishan-330.3 g/l deposits and the Chunagar-252.0, Izgancha-333.5 g/l structures, where strong brines have also accumulated in the uplifted part of the Beshkent macrogib.

The water content of the Upper Jurassic (J3) deposits of the studied territory is associated with the XVI-XV horizons of the carbonate formation (CF), and their hydrochemical properties are characterized by the predominance of chloride-calcium brines of various metamorphic states. Their main characteristic is the general tendency towards increasing mineralization and metamorphism of formation waters in the southwestern direction and as they move away from the fault zones of Jurassic deposits [10, 14].

In the zone of upper Jurassic deposits recovery in the territory of the Bukhara Steppe, a distribution band of waters of mixed genetic type with mineralization less than 50 g/l is observed (Sev. Quyimozor-48 g/l, Karnabchul-42.2 g/l, Chember-28.7 g/l, Azlyartepa-32.7 g/l, Uvada-2.80 g/l), the slightly saline zone is distributed on the northeastern edge of the territory within the Shurasan-13.3 g/l structure (Fig. 4).

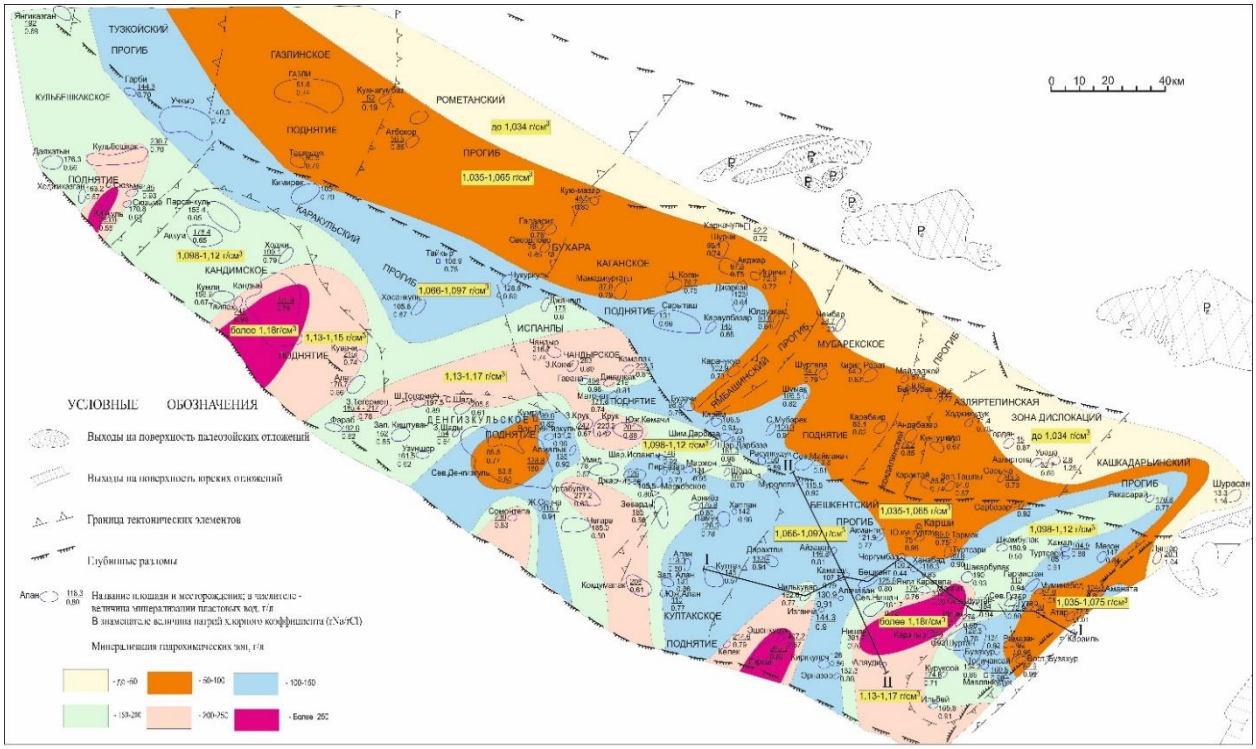

Figure 4. Schematic map of the hydrochemical zoning of groundwater of Upper Jurassic deposits of Western Uzbekistan

Formation waters with a mineralization of 50-100 g/l are widespread in the beach area.

Kuhnagumbas, Gazli, Tashkuduk, Kuyumazar, Mamajurgati, Kyzylravat, Shurtepa, Atbakor, Galaosiyo, Kungirtau, Gharbiy. Stony (from 48.0-56.3 g/l to 87.0-96.6 g/l), high metamorphic coefficient (pNa/pCI) - from 0.67 to 0.83, and sulfate content (pSO_4/pCI) - from 0.09 to 3.0.

Formation waters with a mineralization level of 50-100 g/l are widespread in the areas of Kuhnagumbaz, Gazli, Tashkuduk, Kuimazar, Mamazhurgati, Kizilravot, Shurtepa, Otbakor, Galaosiyo, Kungirtov, and West Tashli, and their mineralization level ranges from 48.0-56.3 g/l to

87.0-96.6 g/l. These waters have a high degree of metamorphism coefficient (pNa/pCI) from 0.67 to 0.83, and the degree of sulfate content (pSO_4/pCI) from 0.09 to 3.0.

However, in the southern regions of the Mubarek uplift, a hydrochemical complication associated with the distribution of mineralized waters has been identified, which exceeds 100 g/l (Karym-106.5 g/l, Rasylkuduk-150 g/l, Shim. Maymanak-113.8 g/l) in the hydrochemical zone 50-100 g/l. The hydrochemical complexity is associated with the penetration of formation waters from the Lower Jurassic deposits by the Ispanli-Chandyr uplift, where the waters are more mineralized and metamorphosed (Sarytash-131 g/l, Djarkak-123 g/l, Karaulbazar-145 g/l, etc.), as well as with the hidden release of Jurassic aquifers along "hydrogeological windows" along the Setalantepa and South Djarkak faults of the Upper Jurassic water barrier.

In the Jurassic KF of the Chardzhou Stage, metamorphosed waters of the chloride-calcium type with mineralization of 100-150 g/l, 150-200 g/l and more are mainly present, which may be associated with greater hydrogeological stability of these areas due to blockage of underground runoff by lithological barriers or tectonic disturbances. The metamorphism coefficient of water in this zone varies from 0.57-0.70 to 0.75-0.85, and an increase in the content of iodine (5-10 mg/l), bromine (100-300 mg/l), and ammonium (100-200 mg/l) is observed.

In the eastern and northwestern parts of the Dengizkul uplift (Urtabulak, North Urtabulak, South Urtabulak, West Tegermen, etc.), the formation waters of the Upper Jurassic deposits consist of strong and very strong saline solutions, the mineralization of which ranges from 201-277.3 g/l (Umid, Urtabulak deposits) to 305.8 g/l (North Tegermen deposit). These waters have a high metamorphic coefficient (0.58-0.63) and a low sulfate content and belong to the chloride-calcium type. Iodine-bromine waters are developed in brines (the content of iodine and bromine exceeds 20 mg/l and 300 mg/l, respectively). The highest concentration of iodine was 37.4 mg/l and bromine - 283 mg/l, which was determined in the area of strong brines in the Dengizkul uplift. In the territory of South Zekra, the bromine content of brines was 987 mg/l, and in Pirnazar and Markovskaya, the iodine content reached 42.4-52.8 mg/l. Similar iodine-bromine waters are characteristic of the Urtabulak-Kokdumalak area of strong brines, where the amount of iodine reaches 57.7-67.9 mg/l, and bromine - 350-652 mg/l.

Highly mineralized brines: Ispanli-Chandyr (Chandyr fields, Ghar. Kokchi, Havana, West Kruk, Jan. Kemachi, Kuvachi, Kandym, Khodzha, Taylak, Hakkul, Kulbeshkak) with mineralization from 215.0-230.0 g/l to 278.0-283.2 g/l, with a metamorphism coefficient from 0.74 to 0.98, and low sulfate content up to 0.0007, a high content of microcomponents was revealed: iodine 13.4-21.6 mg/l, bromine 283-519.7 mg/l, and ammonium 200-300 mg/l.

A hydrochemical zone of groundwater of the chloride-calcium type with a mineralization of 100-150 g/l and 150-200 g/l is observed in most of the territory of the Beshkent macrophage. It should be noted that in the central and southern parts of the Beshkent Depression, as well as with the depth of occurrence of Upper Jurassic deposits, a gradual increase in mineralization is observed. However, this hydrochemical field is completely heterogeneous. Against the background of the general trend of mineralization and metamorphism of formation waters, in the central part of the depression (zone of stable hydrogeological regime of water exchange) and in individual areas, there are areas with the development of highly mineralized waters (Ilim-270.1 g/l). Similar zones are distinguished in the form of hydrochemical anomalies in the area of the Darakhtyli-2 (255.3 g/l), Girsan-6 (265.2 g/l), Chilkuvar-2 (285.5 g/l), Mangit-2 (296.9 g/l) and Eshonkuduk-1 (407.2 g/l) wells. As can be seen, the presence of these anomalies in this zone is associated with the influence of buried intersalt rapes on the formation of ultra-stable brines. In these strong brines, the highest iodine content was 46.6-48.7 mg/l and the highest bromine content was 638.7-835 mg/l [15].

The groundwater of the Cretaceous (K) deposits of Western Uzbekistan is also distinguished by great diversity: all genetic types of water are found, the mineralization in them varies from 1 to 231 g/l. Slightly mineralized and metamorphosed waters, with a pronounced infiltration genesis, are distributed in the alb-cenomanian deposits of the Bukhara Stage.

The hydrochemical zone of saline and very weak brines with a mineralization of 10-50 g/l is present only in some areas of the Chardzhou step, in particular, in the areas of Kyrkynchak, Shimoliy

Kamashi, and Alyauda, the total mineralization of which is 20.7 g/l, 39.0 g/l, and 46.4 g/l, respectively. Very weak brines with a mineralization of 50-100 g/l are also widespread in the Kandym, Dengizkul, Ispanly-Chandyr, Kultak uplifts, and the Karakul depression. Strong salts of the chloride-calcium type (100-150 g/l) are observed in the Kultak uplift (Pomuk, Kultak) and the Kashkadarya Basin (Shurasan, Yakkasaray), the metamorphic coefficient of which is 0.5-0.8. Subsequently, as a result of regional subsidence, the mineralization and metamorphism of formation waters increase further, reaching from 150 g/l to 227.4-230.7 g/l in the Alat and Kulbeshkak areas, with a metamorphism coefficient of 0.7-0.71 (Fig. 5).

The mineralization of formation waters in the lower Cretaceous deposits of the Beshkent macropogib is as follows: Buzakhur-112.8 g/l, Shim. Qamashi-131.7 g/l, Maymanoqtoğ-133.7 g/l, Ayzovat 206.5 g/l, which is associated with the outflow of water from the lower stratigraphic aquifer complexes. The formation waters of the Upper Cretaceous deposits of the territory of Western Uzbekistan, mainly of the Bukhara Stage, are mainly slightly saline and saline waters (< 10 g/l, 10-50 g/l) and are metamorphosed to varying degrees - from 1.05 to 5.2.

Thus, in pressure water complexes of the Cretaceous period, infiltration water exchange processes are significantly more pronounced than in the Jurassic period. This is especially characteristic of the Upper Cretaceous part of the confined aquifer of the Bukhara Stage.

Hydrochemical anomalies observed in the Cretaceous aquifer complexes of the Bukhara Stage are explained by the penetration of chloride-calcium salt solutions from the Jurassic deposits through permeable tectonic disturbances from below. Within the Chardzhou Stage, metamorphosed sedimentary waters have been preserved, the composition of which has likely been repeatedly renewed during the Elysian water exchange process, which dominated throughout the entire history of the hydrogeological development of the Mesozoic confined aquifer system of Western Uzbekistan.

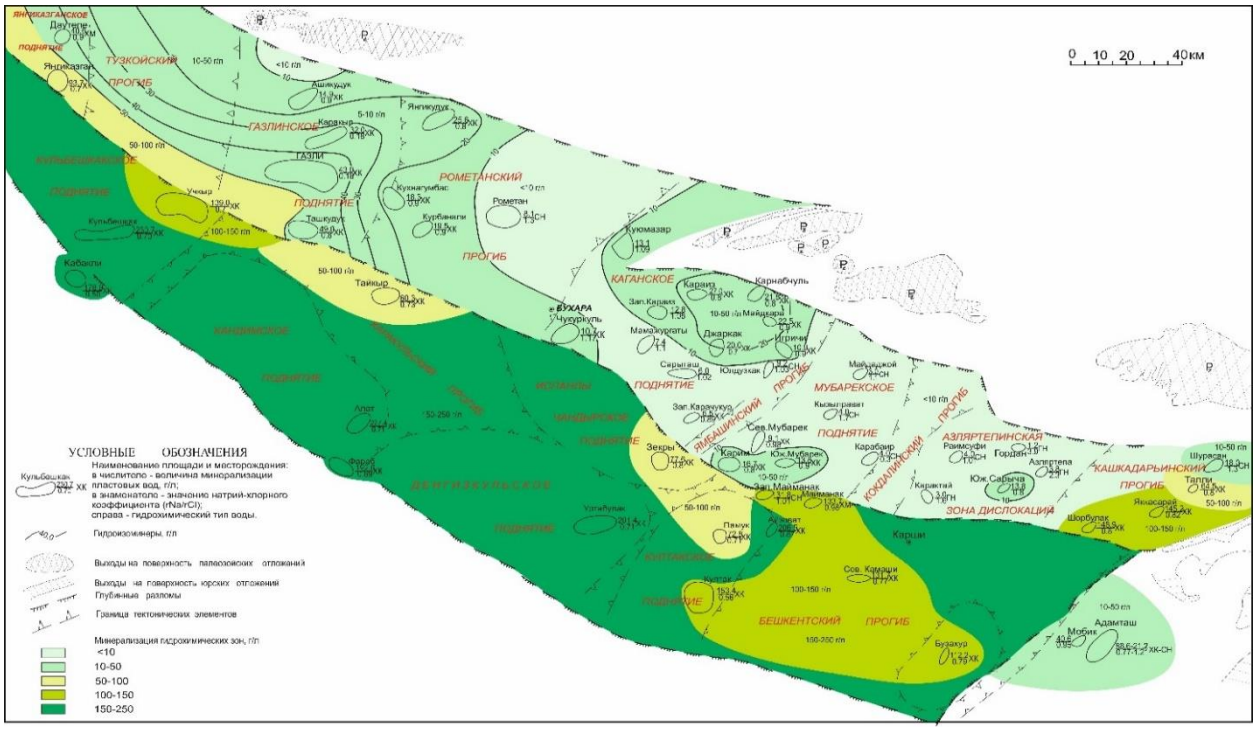

Figure 5. Schematic map of the hydrochemical zoning of groundwater of the Lower Cretaceous deposits of Western Uzbekistan

One of the important directions in the study of the regularities of the distribution of dissolved organic matter (DOR) and dissolved gases in the formation waters of Mesozoic deposits of Western Uzbekistan was the determination of the prospecting significance of aromatic hydrocarbons. Geochemical changes in the "water-rock" system are a direct indicator of the presence of hydrocarbon deposits. The composition and quantitative concentrations of individual groups of SEOM (naphthenic

acids, phenols, benzols, organic carbon, etc.) are successfully used as direct search indicators for determining the presence of hydrocarbons in the earth's crust [3, 7].

Especially widespread VROV (Hydrogen-Related Organic Hydrogens), exceeding the background content, was recorded in the Chardzhou step. The highest values are observed in the Kandym, Dengizkul, Ispanly-Chandyr, Kultak uplifts, and the Beshkent basin, with a sharp increase in the VROV content in a number of deposits (Mangyt, Shakarbulak, Nishan, Tarmak, Western Border, Kokdumalak, etc.). As can be seen, for the Jurassic aquifer complex, the statistical dependence of trap productivity on the VROV value is quite stable, which is confirmed by the discovery of hydrocarbon reserves in new areas: Chegaraqum, Western Sabo, Yumay, Northern Darvoza, Supali, Chilgumbaz, Chilkuvar, Yangi Karatepa, Feruza, Khanabad, Mirmiron, Ilim, Northern Shurtan, Oydin, and others. As can be seen, for the Jurassic aquifer complex, the statistical dependence of trap productivity on the UOB value is quite stable, and in new areas - Chegaraakum, Western Sabo, Yumay, Northern Darbaza, Supali, Chilgumbaz, Chilkuvar, Yangi Karatepa, Feruza, Khanabad, Mirmiron, Ilim.

It is known that iodine in groundwater has a very high migration ability, volatility, and dispersion properties, and is well adsorbed on rocks. Ultimately, its quantity is regulated depending on the conditions of water exchange and the degree of hydrogeological closure of the subsoil [2, 5]. Analysis of the distribution of iodine in the groundwater of Jurassic deposits of the Beshkent macropoygib shows that the increase in iodine content is clearly similar to the general mineralization of waters and is associated with certain gas-oil-condensate deposits (Shurtan, Sev, Shurtan, Ilm, Rubai, Mangit, Sherkent, Yangi Karatepa, Beshkent, Kamashi, S. Nishan). High concentrations of iodine, bromine, and ammonium have also been established in highly mineralized brines of Jurassic deposits of the Chardzhou Stage (Ispansko-Chandyr, Kulbeshkak uplift). When considering the distribution of the latter and comparing the iodine-bromine values with the oil and gas prospects map of the region, it was established that the oil and gas regions correspond to areas with a high and high concentration of iodine and bromine in groundwater.

It should also be noted that among the indirect indicators of oil and gas content, in addition to the total salt content of waters, the sulfate content of groundwater (pSO_4/pCl) is also significant. The collected materials and their analysis show that the most characteristic feature of the hydrochemical composition of oil and gas field waters is the absence or very low content of sulfates (from 0.021 to 0.0005), i.e., very low indicators. Consequently, the low sulfate content and high content of microcomponents can also be recognized as local criteria for formation waters of Jurassic deposits.

CONCLUSION

Summarizing the brief hydrochemical characteristics of Jurassic and Cretaceous deposits of Western Uzbekistan, it should be noted that modern hydrochemical zonality is inherited mainly from the elizion stages of hydrogeological development. Apparently, the decisive role in this was played by the processes of deep metamorphism of sedimentogenic and ancient infiltrogenic groundwater. Infiltration water exchange processes affected only the peripheral parts of the water-pressure systems and individual uplift zones. The chalk part of the water-pressure system of the Bukhara bench is the most eroded, the inner, sunken parts of the bench are the least eroded.

As a result of the conducted research on the hydrogeochemical properties of formation waters of Mesozoic deposits of Western Uzbekistan, it was established that predominantly highly mineralized, metamorphosed, and sedimentogenic waters are widespread. At the same time, the formation waters of Jurassic and Cretaceous deposits are significantly enriched with various gases, organic matter, with a high and low sulfate content of microcomponents (iodine, bromine), which is associated with the hydrogeological closure of the subsoil and the stable hydrogeological regime of waters, contributing to favorable hydrogeochemical conditions for the formation and storage of UV deposits.

A stable correlation with oil and gas indicators has been established, reflecting the general regularity of increasing the reliability of chemical-organic indicators of trap productivity and oil and gas content in the Jurassic aquifer complex. The maximum VROV value was established in Akkum,

Kumli, Khoja, Alat, Uzunshor, Chandir, Havana, Umid, Chegara, Yumay, Alan, Pomuq, Chilquvar, Qamashi, Feruza, Ilim, Mezon, and other areas.

In the areas of Jurassic and Cretaceous water supply complexes, located far from ancient and modern infiltration zones, the metamorphic factor associated with the chemical composition of layered waters of Mesozoic sediments and their modern hydrogeochemical zonality has been confirmed.

Consequently, the study of the hydrogeochemical conditions of natural water supply systems is one of the most important links in the hydrogeological study of oil and gas zones, since they not only determine the hydrogeochemical zoning, but also have a very important influence on the conditions of reservoir accumulation and storage.

Резюме: *В статье рассматриваются особенности мезозойских отложений Западного Узбекистана и современное состояние их зональности распространения. Подземные воды играют важную роль в образовании и сохранении залежей нефти и газа. При определенных условиях это может привести к их накоплению или уничтожению. Поэтому целью настоящего исследования является определение коллекторских свойств и роли подземных вод в формировании и распространении углеводородов в мезозойских отложениях Западного Узбекистана. В данной работе применен комплексный подход к решению задач, связанных с научным синтезом фактических данных о юрских и меловых отложениях исследуемой территории. При этом использовались материалы, характеризующие различные параметры геологических слоев. В заключение можно сказать, что нефтегазовый потенциал исследуемой территории был оценен на основе различных критериев и представлены результаты.*

С общегеологической точки зрения важным критерием поисков нефти и газа является учет особенностей нефтегазообразования, а также динамики и химической единицы пластовых флюидов. Этот фактор заслуживает внимания при выборе рационального подхода к геологоразведочным работам. На основе геологического анализа юрских и меловых отложений на исследуемой территории выявлены различные зоны с высоким потенциалом для нефти и газа и соответствующие их площади. Выявление таких локальных участков на исследуемой территории позволит существенно расширить круг потенциальных поисковых объектов, что в перспективе позволит повысить эффективность поисково-разведочных работ.

CHEMICAL ACTIVATION OF JELVAK PHOSPHORITES OF KARAKALPAKSTAN

Pirnazarov B.U., Madenov B.D., Reymov A.M., Kurbaniyazov R.K., Urazmatova D.Sh.
Karakalpak state university named after Berdakh

Summary: *The article investigates the process of chemical activation of Karakalpak phosphorite flour using ammonium nitrate solutions at a temperature of 70°C and urea melt. A comprehensive analysis was conducted on the influence of these reagents on the structure and properties of phosphate raw materials.*

It is shown that depending on the nature of the activator and the N:P_2O_5 ratio in the activation products, the relative content of assimilable P_2O_5 increases: from 37,78% in the original phosphor original phosphorite flour to 79.87–94.59% when treated with ammonium nitrate solution, and to 66.79–85.31% when using urea melt.

Key words: *Ammonium nitrate solution, urea melt, chemical activation, pebble phosphorite, balanced NP fertilizers, composition and strength of granules*

Introduction: Currently, phosphorous fertilizers are produced at chemical enterprises of JSC "Uzkhimiyosanoat," such as JSC "Ammonphos-Maxam" and the "Kokand Superphosphate Plant." The phosphate raw material for these plants is provided by the Kyzylkum Phosphorite Complex. However, due to the shortage of high-quality phosphate raw materials, these plants produce only 140-150 thousand tons of phosphorous fertilizers based on 100% P_2O_5 content. In the context of the shortage of phosphorous fertilizers, the development of small local deposits of agronomical ores, which are currently not utilized in industrial production, has become a pressing issue.

One of the key reserves for increasing the production of phosphorous fertilizers is the development of local (undeveloped) deposits. Karakalpakstan has dozens of deposits of such low-grade phosphorites (Khudjakulsky, Sultan-Uizdag, Khojaylinsky, Nazarhansky, Chukai-Tukai, and others), with a total reserve of over 70 million tons. These can be developed for agricultural purposes and quickly address the issue of supplying locally needed phosphorous fertilizers. Their advantage lies in the fact that they are located in close proximity to the consumer, require minimal capital investment, can be put into operation in a short time, and the product (raw-milled phosphorites) is significantly cheaper than any other phosphate product.

The highest effect of phosphorite flour is observed when implementing the "phosphorization of soils" technique, which involves a one-time application of at least 1 ton/ha, or 200 kg/ha of P_2O_5, to the soil for a long period (up to 5 years or more) [1].

In agrochemistry, the criterion for the assimilability of phosphorus from its compounds is the share of P_2O_5 extracted into solution by 2% citric acid; the latter's dissolving capacity is similar to that of the humic acids in soil. In pebble phosphorite – the Kyzylkum variety – the relative content of citric acid-soluble P_2O_5 is 25-35%, which is significantly higher compared to, for example, Karatau or, even more so, apatite ores [2].

For example, in the study [3], the properties and effectiveness of natural phosphates from various deposits were examined for their direct use as fertilizers. The most soluble in ammonium citrate solution and 2% citric acid were the phosphorites from Tunisia and Curacao, followed by phosphorites from South Carolina, Florida, Idaho, Tennessee, and apatite from Virginia. Tunisian phosphorite has the highest specific surface area, while Virginia apatite has the lowest. The compactness of particles reduces the effectiveness of the phosphorites.

N.N. Bushuyev [4] used the focusing camera-monochromator Ginie FR-552 to perform high-precision determination of the structural parameters of phosphate materials. In this work, a linear relationship was established between the agrochemical characteristics of known types of phosphate raw materials from various deposits and the values of the "a_0" and "c_0" parameters of the unit cell. Based on the obtained "a_0" values, the phosphorites are arranged in order of increasing these values:

the 1st group includes pebble phosphorites, the 2nd group – granular phosphorites, the 3rd group – shell phosphorites, and the 4th group – apatites. That is, the lowest unit cell parameter values are found in pebble phosphorites, while the highest are found in apatites. It is concluded that the smaller the crystal size, the greater their interaction with soil solutions, and the higher their agrochemical effectiveness. Therefore, pebble phosphorites can be directly used as fertilizers in the form of ground flour without the need for long-term trials.

The use of finely ground phosphorite as a direct fertilizer, without any chemical processing, would provide agriculture with the cheapest phosphorous fertilizer [5].

However, phosphorite flour is successfully used in large quantities on acidic soils [6], while it is ineffective on neutral and alkaline soils in Uzbekistan.

In these cases, methods to increase its effectiveness include the use of organo-phosphorite composts made from local types of organic raw materials (manure, peat, poultry litter, lignin) [7]. For instance, in the study [8], organo-mineral fertilizers were obtained through composting cattle manure (CM) and poultry litter with phosphorite flour from Karakalpakstan, depending on the manure-to-phosphorite ratio and the duration of the composting process. It was found that the optimal manure to phosphorite ratio is 1:0.06–1:0.12, with a composting period of 3 months. In another source [9], composts were prepared based on CM manure and mineralized mass, a by-product of the dry beneficiation process of Kyzylkum phosphorites, depending on the manure-to-phosphorite ratio (10:0.8; 10:1; 10:1.4), the dispersion of the mineralized mass (-0.16; -0.25+0.16; -0.5+0.25; -1+0.5; -3+2; -2+1; -5+3 mm), and the duration of composting (1; 15; 30; 45; 60; 75; 90 days). It was shown that the lower the amount of phosphate raw material in the mixture, the longer the composting time, and the higher its dispersion, the higher the content of assimilable P_2O_5 in relation to total P_2O_5. The degree of transformation of the organic part of the manure into humus substances, including humic acids, fulvic acids, and water-soluble organic substances, also increases.

To expand the range of phosphorite flour applications to neutral soils, it is necessary to increase the content of assimilable forms of phosphorus. This can be achieved through the activation of phosphate raw materials [10].

Activation can be carried out mechanically [11], mechanochemically [12], chemically [13], thermally [14], complexometrically [15], and microbiologically [16].

In the study [17], activation of phosphorites from the Chulaktau, Kokdjon, and Chilisay deposits (Kazakhstan) was carried out using a 10% ammonium nitrate solution, a 30% ammonium sulfate solution, and 50-70% calcium nitrate solutions. The activation conditions were as follows: interaction for 30 minutes at a temperature of 80°C and a solid-to-liquid ratio of 5:1. When the ammonium sulfate and ammonium nitrate solutions interacted with Chulaktau phosphorite, the content of assimilable phosphates in the fertilizer increased by 38-42% by weight, with a decarbonization degree of 24-41%. However, no increase in assimilable P_2O_5 content was observed in Kokdjon phosphorite.

For chemical activation, phosphorite ore from the Khojakul deposit was used, with the following composition (wt.%): P_2O_5 – 19.11; insoluble residue – 1.64; SiO_2 – 28; CaO – 32.83; MgO – 0.30; Fe_2O_3 – 3.50; Al_2O_3 – 1.54; SO_3 – 1.10; CO_2 – 4.03; F – 2.09. This raw material belongs to the pebble type, whose main minerals are kurskite and francolite in nearly equal amounts. Before use, it was ground in a ball mill. Its particle size distribution is characterized as follows: class (-5+3 mm) – 7.65%; (-3+2 mm) – 24.43%; (-2+1 mm) – 18.29%; (-1+0.5 mm) – 3.0%; (-0.5+0.25 mm) – 22.73%; (-0.25+0.16 mm) – 10.07%; (-0.16+0.1 mm) – 4.11%; (-0.1+0.05 mm) – 6.20%; (-0.05 mm) – 3.51%.

Chemical activation of Khojakul pebble phosphorite flour with the above composition was carried out using 70% and 85% ammonium nitrate solutions. The experiments were conducted in a thermostatted cylindrical reactor with a volume of 200 ml, equipped with a paddle stirrer, at a temperature of 90°C for 30 minutes. The quantities of components were calculated so that the N:P_2O_5 ratio in the final fertilizer was 1:0.1, 1:0.3, 1:0.5, and 1:0.7. After the components interacted, the pulps

were dried in a thermostat at 105°C, and the products were analyzed for nitrogen, various forms of phosphorus, and calcium according to established methods [18].

Activation of phosphorite flour with molten urea was carried out as follows. A weighed amount of urea was melted in a porcelain beaker equipped with a stirrer by heating in a thermostatted glycerin bath. The melt temperature was maintained at 140°C. The weighed amount of phosphorite flour was slowly added to the melt, and the mixture was thoroughly stirred. The interaction time of the components was 30 minutes. Afterward, the molten mixture was poured into porcelain dishes and cooled. Once cooled, the product was ground and analyzed. The component ratio $N:P_2O_5$ also varied within the range from 1:0.1 to 1:0.7. The results are presented in Tables 1 and 2.

The data show that the more phosphorite flour is added to the ammonium nitrate solution or urea melt, and the lower the nitrogen content, the higher the phosphorus and calcium content in the product. For example, when using a 70% ammonium nitrate solution, increasing the mass ratio of $N:P_2O_5$ from 1:0.1 to 1:0.7 causes the nitrogen content in the products to decrease from 29.28% to 15.28%, while the total P_2O_5 and CaO contents increase from 3.05% to 10.18% and from 5.21% to 18.88%, respectively. For the 85% solution, these values change from 29.41% to 15.26%, 2.96% to 9.18%, and 5.68% to 19.51%, respectively (Table 1). When activating Karakalpakstan pebble phosphorites with a 70% ammonium nitrate solution, the content of the assimilable form of CaO decreases from 93.47% to 79.98% (Fig. 1). In the 85% solution, the assimilable CaO decreases from 94.37% to 80.98% (Fig. 2).

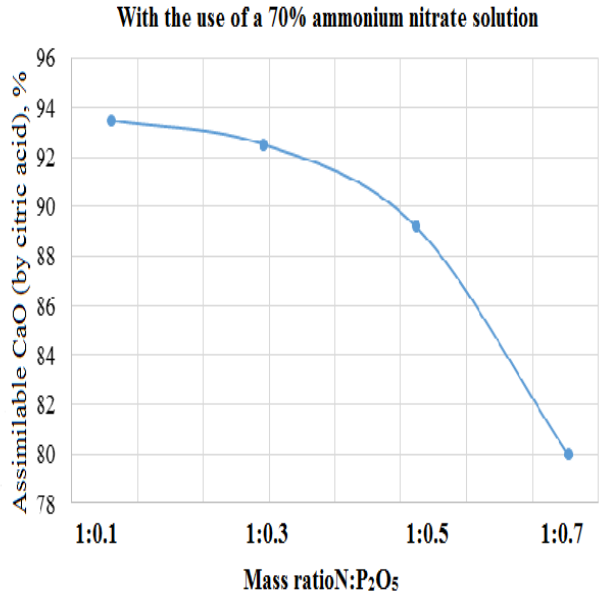

Figure 1

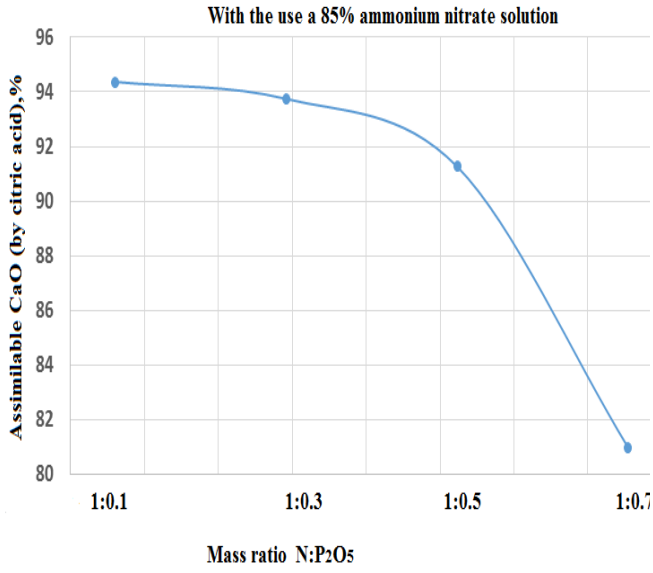

Figure 2

As the data show, treatment of Khojakul phosphorite flour with ammonium nitrate solution sharply increases the content of assimilable phosphorus forms. In the original phosphate raw material, the content of assimilable P_2O_5 determined by EDTA (Trilon B) relative to total P_2O_5 was 32.23%, and by citric acid was 37.78%. In the resulting products, these values range from 61.39% to 90.82% and 79.87% to 93.78% for the 70% ammonium nitrate solution, and from 65.36% to 91.22% and 82.35% to 94.59% for the 85% solution, respectively. Such products are already effective nitrogen-phosphorus fertilizers. Their strength properties meet agricultural requirements, ranging from 3.69 to 6.89 MPa and 3.82 to 7.02 MPa, respectively. The concentration of ammonium nitrate solution has little effect on the change in assimilable phosphorus content. It is also worth noting that water-soluble forms of calcium appear in the interaction products, amounting to 8.69–16.89% and 6.82–16.02%, respectively.

This indicates that due to its acidic nature, ammonium nitrate at relatively high temperatures partially decomposes the calcium carbonate present in the phosphorite flour, resulting in the formation of calcium nitrate and kurskite, along with the formation of monocalcium phosphate.

High contents of assimilable forms of P_2O_5 and CaO in the phosphorite flour activation products (ranging from 66.79% to 85.31%) are also observed when using molten urea at N:P_2O_5 ratios from 1:0.7 to 1:0.1 (Table 2). At the same time, the total contents of N, P_2O_5, and CaO range from 17.29% to 37.19%, 4.22% to 12.32%, and 7.70% to 20.80%, respectively. This method achieves the highest strength of the granulated product, ranging from 3.89 to 10.24 MPa. When activating Karakalpakstan pebble phosphorites with molten urea at 140°C, the content of assimilable CaO decreases from 90.78% to 74.86% (Fig. 3).

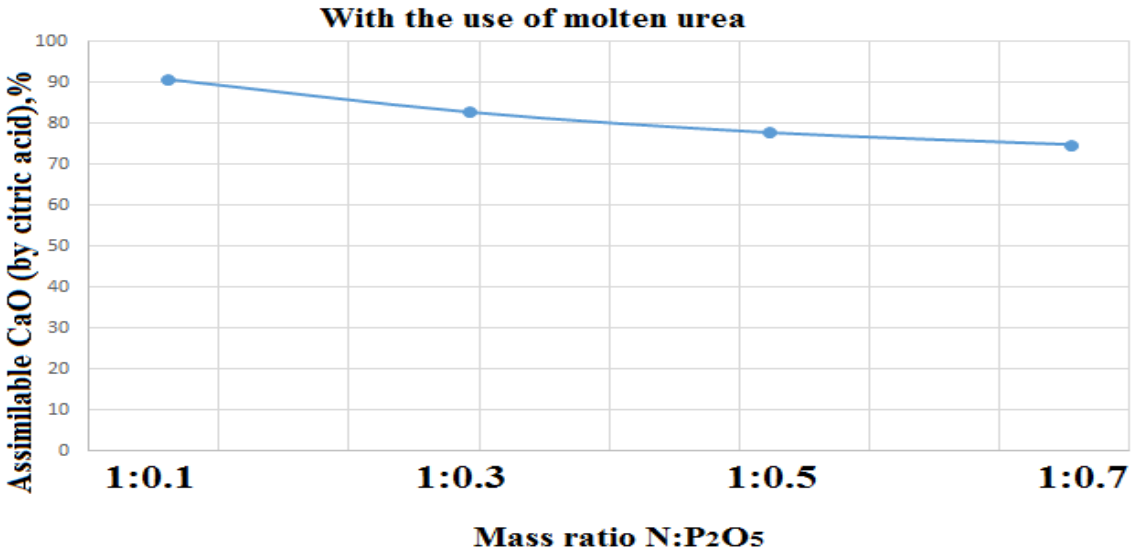

Figure 3

Chemical activation of Khojakul phosphorite flour using concentrated ammonium nitrate solution and molten urea enables the production of nitrogen-phosphorus fertilizers with an optimal ratio of nutrient elements, suitable for use on all soil types and for all agricultural crops. The high availability of pebble phosphorites makes them acceptable for producing fertilizer mixtures using non-acidic methods. Chemical activation of phosphates allows the utilization of substandard phosphate raw materials in the resource base without restricting the content of carbonate, aluminosilicate, and iron-containing minerals, while ensuring a waste-fre a waste-free process.

SOLUTIONS FOR PROVIDING HIGH-QUALITY DRINKING WATER TO THE POPULATION IN REMOTE SETTLEMENTS OF KARAKALPAKSTAN

Pirniyazov S.K.
Karakalpak State University named after Berdakh

Summary: *The article examines the shortage of drinking water in the Aral Sea region and analyzes Singapore's experience in water management.*

Key words: *Aral Sea region, landscape architecture, water resources, "green" technology, Singapore, "NEWater"*

The shortage of drinking water is one of the major global problems of our time, as water is a fundamental natural resource essential for life. This issue is particularly acute in the northwestern districts of Karakalpakstan, where extreme climatic conditions prevail. The policies of the Soviet regime led to a large-scale ecological disaster in the Aral Sea region.

Water availability in the region is influenced by both the scarcity of water resources and environmental factors. Contaminated drinking water has contributed to the deterioration of the health of many local residents. The water shortage has complicated agricultural work, crop cultivation, tree planting, gardening, as well as landscaping and urban improvement projects in villages, towns, and cities.

The government is carrying out large-scale efforts to alleviate this severe ecological situation in the Aral region. Special measures are being implemented in Uzbekistan to address water scarcity, and foreign experience in this area is being studied.

During the state visit of the President of the Republic of Uzbekistan to Singapore, promising agreements were reached on cooperation in the fields of "green" technologies, urban planning and construction, public services, and municipal management. Singapore's experience in rational water management and the use of water-saving technologies deserves special attention [1].

Priority areas of cooperation include the implementation of advanced "green" technologies and digital solutions, as well as the improvement of urban infrastructure and communication systems. It should be noted that Singapore is one of the most developed centers in Asia and a global leader in the implementation of modern technologies. Despite the almost complete absence of natural water resources, the country's extensive experience in water supply management attracts significant interest in Uzbekistan.

Currently, the country has an efficiently functioning urban water supply system known as the "Four Taps." Water from the "first tap" comes from local water sources, the second tap supplies water imported from Malaysia, the third tap is for the reuse of treated wastewater, and the fourth tap is for desalinated seawater.

Singapore also employs rainwater harvesting in its reservoirs. The reuse of wastewater has long been effectively implemented in the country. A specially established municipal utilities council applies the rare NEWater technology for wastewater treatment. The operation of these treatment facilities, managed by municipal services, provides 30% of the daily water supply (520,000 m^3 per day). Typically, after treatment, the water is supplied to industrial and manufacturing enterprises, while the remainder is directed to one of 17 large water reservoirs.

The water reclamation process occurs in three stages. First, fine particles, residues, and bacteria are removed using membrane filtration. Next, reverse osmosis is applied, and finally, the water is disinfected with ultraviolet light and hydrogen peroxide. As a result of these large-scale reforms in water management, Singapore obtains 30% of its required water through the NEWater program, 20% from seawater desalination, 10% from local water bodies, and only the remaining 40% from Malaysia.

According to studies, water treated using the NEWater technology fully meets WHO standards and is even suitable for cooking and drinking.

According to forecasts by companies responsible for public water supply, by 2060 they plan to double the volume of desalinated water through the launch of two new plants, triple the capacity of the NEWater facilities, and increase the share of water supply to 80% [2].

Thus, one of the main current problems in Karakalpakstan is the shortage of water and the deterioration of drinking water quality. One of the effective solutions for providing high-quality drinking water in the extreme settlements of Karakalpakstan is Singapore's experience, namely:

- the reuse of treated water;
- desalination of groundwater, which, in our opinion, can yield good results.

The reuse of wastewater in Karakalpakstan will help improve the environment by treating sewage from densely populated cities (e.g., Nukus and others), using it for irrigation, and planting various trees on vacant plots around the city. Karakalpakstan is extremely rich in groundwater. Therefore, we believe that this water can be utilized in the national economy through desalination.

STUDYING THE EFFECTIVENESS OF THE HEKTAŞ FIBON, K.SUS. PREPARATION IN COMBATING SPIDER MITES IN COTTON

Rustamov K.Zh.
Republican Scientific Research and Production Center for Termite Control of the Academy of Sciences of the Republic of Uzbekistan.

Summary: *In this study, the biological efficacy of the HEKTAŞ FİBON, k.sus. formulation against the spider mite on cotton was evaluated under the conditions of the "Ahmad ali dehqon ota" farm in the Urta Chirchik district of Tashkent Region. The biological efficacy of HEKTAŞ FİBON, k.sus. after treatment reached 65.7%, 79.7%, and 96.2% on the respective assessment days, fully meeting the established evaluation criteria. Based on the obtained results, HEKTAŞ FİBON, k.sus. can be recommended as an effective agent for controlling the spider mite on cotton.*

Keywords: *Spider mite, HEKTAŞ FİBON, cotton, acaricide, formulation, biological efficacy, pest control, field trial, Spiromesifen*

Introduction

Increasing cotton yield—as one of the agricultural crops grown in Uzbekistan, which is also important for export—requires constant attention from both producers and scientists. Significant losses in cotton yield and a decrease in the technological quality of cotton fiber are directly associated with the activity of harmful insects, in particular aphids, thrips, cotton bollworms, spider mites, and whiteflies.

In combating these pests, along with agrotechnical and biological methods, traditional chemical preparations are also widely used. However, certain shortcomings of these insecticides make it necessary to select and introduce into agricultural practice new, highly effective preparations produced by foreign manufacturers that meet modern ecological standards. The expansion of the range of insecticides is also associated with the need to overcome resistance that develops in certain pest populations as a result of prolonged use of a single preparation.

The purpose of this research is to study the results of the research work of HEKTAŞ FİBON, LLC "Qorasuv Agro-kimyo ta'minot" in Uzbekistan. (active substance - Spiromesifen 240 g/l) as a means of combating spider mites on cotton.

To achieve this goal, a large-scale field experiment was conducted on cotton at the "Ahmad Ali Dehqon Ota" farm in the Urtachirchik district of the Tashkent region, where the biological effectiveness of this preparation against this pest was studied.

Literature review Spider mites, cotton bollworms, and insects in cotton fields cause significant damage to cotton crops in Uzbekistan under favorable conditions for their development. Spider mites are one of the most serious pests of cotton in Uzbekistan. In some areas, spider mites can destroy more than half of the harvest, and in ordinary years, crop losses can reach 6-10%, and in some cases up to 14%. Along with crop losses, the spider mite also negatively affects the fiber quality of cotton. In heavily affected areas, the fiber shrinks by 1.0-1.5 cm, the seeds of heavily affected plants lose germination energy, and germination is slow and uneven. The spider mite is also harmful at the imago, nymph, and larval stages. In cotton-growing regions, 12-20 generations of spider mites develop in one season [1.5.6].

effectiveness of the preparation HEKTAŞ FİBON, k.sus. was tested in the cotton fields of the

H
E
K **Pest.** Spider mite. Occurs in the larval, nymph, and imago stages. On average, 25-30 pests T were identified on one leaf. [1.2].
A
Ş

F

Soil. Soils of the experimental plot - typical sierozem soils. Salinization is not observed as a result of irrigation. The depth of groundwater is 1.5-1.9 m.

Agrotechnology. Before the start of testing against the spider mite, two cultivations, two irrigations, chiseling, and inter-row cultivation were carried out. The first irrigation was carried out before cotton flowering, during the formation of vegetative organs of plants, the second - during the mass formation of bolls. [2].

Agroclimatic indicators. The territory of the "Ahmad Ali Dehqon Ota" farm, located in the Urtachirchik district of the Tashkent region, belongs to the Chirchik agroclimatic district. This region is located in the upper part of the Chirchik valley, close to its lower reaches. The border of the district runs along the watershed of the Ugam mountain range in the northwest, along the watershed of the Pskem mountain range in the east and crosses the Angren plateau, and along the watershed of the Chatkal mountain range in the south. The western boundary coincides with the boundary of the Tashkent agroclimatic region, with an elevation of about 600 m and borders the area with the distribution of gray soils. In the Chirchik agroclimatic region, the following agroclimatic zones are distinguished: at an altitude of 600-800 m - hot and dry, in the range of 800-1360 m - warm and humid, above 1360 m - cool and humid. When the sum of effective air temperatures exceeds 10°C, it reaches 4000°C in the lower part of the region and 1000°C at an altitude of 2300 m. In winter, the air temperature is quite variable, with warm weather alternating with sharp frosts. The frost-free period lasts from 191 to 218 days. The summer season is moderately hot. The absolute maximum air temperature is 44°C.

Results and their analysis

Testing of the preparation HEKTAŞ FİBON, k.sus. was carried out on the scale of a field experiment, which included a large experimental plot.

For each experimental variant, the area of the experimental plots was three times repeated, each 1.0 ha.

Experimental diagram.

1. HEKTAŞ FİBON, c.sus. - 0.4 l/ha
2. SELECTIN 1.8% EC. (standard) - 0.4 l/ha
3. Control - unprocessed

During the tests, the consumption rate of the working solution was 300 l/ha.

Duration and conditions for the use of the drug. Treatment of plants with working solutions of preparations was carried out in the second ten days of July in the morning hours, with an air temperature of 25°C, wind speed of 1-2 m/s, relative humidity of 30%, without precipitation.

The preparation was applied to the cotton fields with a working solution by spraying on a tractor sprayer OVX-28.

Conducting calculations. The number of pests in the experimental plots was recorded on days 3, 7, and 14 before and after treatment with working solutions of preparations in accordance with the requirements of the "Methodological Instructions..." and the working program.

Test results and analysis of the preparation. The percentage of pest decline is accepted as a criterion for biological effectiveness. This indicator was assessed by comparing the effectiveness of the direct action of the drug with the control, depending on the type of pest and the approved methodology. For a positive assessment of the drug in the fight against spider mites, the biological effectiveness should be at least 95% or higher (methodological guidelines..., 1986, 2004) [4].

Biological effectiveness was calculated using the Abbott formula, where:

$$C = \frac{Aв - Ba}{Aв} \times 100$$

C - biological effectiveness in the percentage of pest number reduction with correction of control;

A - number of spider mites before treatment in the experiment;

a - live spider mites after treatment in the experiment;

V - the number of live spider mites in the previous count in the control;

v - the number of live spider mites in subsequent counts in the control.

The results of calculating the biological effectiveness of the preparation HEKTAŞ FİBON, k.sus. and the standard are presented in the table. Analysis of the biological effectiveness values of the studied and reference preparations at the applied consumption rates led to the following conclusion:

The biological effectiveness of the drug against spider mites HEKTAŞ FİBON, c.sus. at a rate of 0.4 l/ha from the third to the fourteenth day was 65.7; 79.7 and 96.2% respectively. For the reference preparation, respectively, by days - 66.1; 78.9 and 95.2% biological effectiveness was observed (table).

Table

Biological effectiveness of HEKTAŞ FİBON, K.Sus. in controlling spider mites on cotton fields at the "Ahmad Ali Dehqon Ota" farm, Urtachirchik district, Tashkent region

№	Variant	Application rate, L/ha		Average number of pests per leaf (sample)				Biological effectiveness, by days		
		Preparation	Working solution	Before treatment	After treatment, by days					
					3	7	14	3	7	14
1.	HEKTAŞ FİBON, k.sus.	0,4	300	27,5	9,1	5,1	0,9	65,7	79,7	96,2
2.	СЕЛЕК ТИН 1,8% к.э. эталон	0,4	300	26,9	8,8	5,2	1,1	66,1	78,9	95,2
3.	Control	untreated	-	28,1	27,1	25,7	23,9			

In conclusion, the conducted tests HEKTAŞ FİBON, k.sus. When using the preparation (Spiromesifen 240 g/l) against spider mites at a rate of 0.4 l/ha on cotton, it was found that it meets the criteria for a positive assessment of the preparation on cotton.

In conclusion, this preparation can be used in large field experiments as an effective agent against spider mites. Treatment by the method of mass spraying on a tractor is recommended.

SELECTION PRINCIPLES FOR PLANTS IN UNFAVORABLE CLIMATIC ZONES

Pirniyazov S.K.
Karakalpak State University named after Berdakh

Summary: *The aim of this research is to study innovative foreign and local experiences in landscaping areas with unfavorable climatic conditions, and based on these findings, to develop recommendations for selecting plants adapted to the harsh climatic regions of Karakalpakstan.*

Key words: *Climatic conditions, Aral Sea, recommendations, landscape architecture, Japanese quince.*

The aim of this research is to study innovative foreign and local experiences in landscaping in areas of the population that face unfavorable climatic conditions, and based on this, to develop recommendations for selecting plants suited to the climate of Karakalpakstan's unfavorable areas.

The geographic climate conditions of Karakalpakstan present specific ecological issues for plant cultivation in unfavorable regions, such as the movement of desert sands and dust storms, the decreasing biodiversity of plant life, and challenges in creating and planning landscapes, which ultimately worsen social conditions. To address these issues, local and foreign experiences related to this field have been studied, their essence revealed, and recommendations developed for applying these experiences to solve regional problems. Proposals are given for stopping the movement of sand carried by strong winds from deserts over plains and populated areas, reinforcing desert soils, selecting and cultivating plants that can turn deserts into forested areas, and creating vegetable gardens under desert conditions, thus improving the ecology of villages and cities located in these deserts and plains while enhancing their landscapes. Improving ecological conditions, plant cultivation in unfavorable regions, scientific articles and reports, trees, shrubs, climbing plants (vines), flowers, herbaceous plants.

Main Part. Introduction. This article addresses critical issues regarding selecting plants for Karakalpakstan's unfavorable climatic zones and focuses on finding solutions. Decree No. 132, dated February 19, 2019, by the Cabinet of Ministers of the Republic of Uzbekistan on intensifying measures for establishing "green cover" – protective forests in areas where water has dried up at the bottom of the Aral Sea; the Presidential Decree No. PF-5611 dated January 5, 2019, regarding additional measures for rapidly developing tourism in Uzbekistan; speech by the President during a video-selective meeting on social-economic development concerning Karakalpakstan on November 10, 2020; Presidential Decree No. PF-60, dated January 28, 2022, regarding "The Development Strategy of New Uzbekistan for 2022-2026," as well as other relevant regulatory documents, highlight tasks that this research aims to address.

The research method follows a standard format. It includes studying foreign and local experiences related to topics and challenges and their solutions through internet materials and practical observations. It also involves generalizing findings to develop proposals aimed at resolving the aforementioned issues. The Aral Sea region is considered one of the most unfavorable areas in our republic concerning plant cultivation due to its natural climatic conditions and soil characteristics, which pose numerous challenges in shaping plant life. To resolve this issue, studying innovative foreign and local experiences in landscaping within population centers facing adverse climatic conditions holds significant importance.

Landscape architecture predominantly utilizes ornamental plants, which include trees, shrubs, climbing plants (vines), flowers, herbaceous plants, and ground-covering species. Trees consist primarily of woody plants, including both trees and shrubs. Trees comprise three parts: roots, a single trunk that rises from the ground, and the primary part – leafy branches or shoots above it. In shrubs, unlike trees, there is no single trunk; they mainly consist of two parts: the underground roots and numerous slender stems that grow above the ground, along with leafy branches attached to them. Trees grow taller than shrubs, live longer, and are sturdier. However, it is difficult to draw a clear

boundary between trees and shrubs because some tall shrubs, such as the buffaloberry or myrtle, can grow like short trees, while some low trees may have heights similar to those of tall shrubs.

All trees and shrubs are considered perennial plants, and they are divided into evergreen and deciduous groups. Evergreen trees and shrubs can be further classified into coniferous and broadleaf types. Coniferous types always have needle-like leaves and differ from broadleaf trees and shrubs by producing cones instead of flowers during the flowering period. Coniferous trees that grow in Uzbekistan include Eastern biota, thorny juniper, blue juniper, Oriental cypress, swamp cypress, Virginian juniper, Zarafshan juniper, Crimean pine, common pine, Eldar pine, and Austrian black pines. Evergreen broadleaf ornamental trees include magnolias and ginkgos. Evergreen shrubs in Uzbekistan include Turkistan juniper, Japanese barberry, evergreen boxwood, and tree-like western arborvitae. The number of deciduous ornamental trees and shrubs is large and diverse.

The natural biological characteristics of trees and shrubs include their height, external appearance, shape and color, density of branches and foliage, flowering period, flower color, drought resistance, and lifespan. Young trees are classified according to their height into three categories [1]:

1. Trees of the first category have a height of 20 meters or higher. Typically included are thorny junipers, common pines, Crimean pines, white willows, white poplars, sycamores (plane trees), common oaks (English oaks), cultivated mulberries (black mulberries), large-leaved linden (basswood), etc.
2. Trees in the second category range from 10 to 20 meters tall. Examples include Eldar pine, steppe mulberry (Morus), junipers (junipers), false chestnut (Aesculus), western arborvitae (Thuja occidentalis), and American black locusts (Robinia pseudoacacia), among others.
3. Trees in the third category range from 5 to 10 meters tall. Examples include Canadian spruce (Picea glauca), Lenkoran acacia (Albizia julibrissin), ginkgo biloba (Ginkgo biloba), catalpa (Catalpa bignonioides), elm tree species (Ulmus minor), hawthorn species (Crataegus), and Japanese sophora, among others.

Trees shorter than 5 meters can be classified according to their ornamental characteristics as a group of shrubs with heights ranging from 0.5 to 5 meters. Shrubs are further divided into three groups based on height:

- Tall shrubs (2–5 m): common junipers, Bundenezh shinigami shrub species like Syringa vulgaris or lilacs, among others;
- Medium-height shrubs (1–2 m): ornamental peonies like Paeonia lactiflora or Ligustrum, among others;
- Low shrubs (0.5–1 m): Kazakh acacia species like Robinia pseudoacacia or Mahonia aquifolium.

Among trees, some prefer sunlight—meaning they cannot grow well in shaded areas—such as birches (Betula), oaks (Quercus), ash-leaved maples (Acer spp.), or Fraxinus angustifolia; meanwhile, there are also shade-tolerant types, such as horse chestnut (Aesculus hippocastanum) or linden trees (Tilia).

A quick method to achieve the ornamental effect is by planting fast-growing trees and shrubs in the designated area. Fast-growing plants include eucalyptus species like Eucalyptus globulus, black poplar, pyramid-shaped poplars, Canadian poplar, balsam poplar, trembling aspen, Gleditsia triacanthos, elms like Ulmus minor, ash-leaved maple; weeping willows; green ashes like Fraxinus pennsylvanica; common pines such as Pinus sylvestris; white acacias like Robinia pseudoacacia, etc. There are also plants with wide-spreading roots suitable for stabilizing soil on sloped terrain, such as field maples like Acer campestre or Tataria acacias widely distributed across regions; these include narrow-leaved hawthorn types, Crataegus monogyna, among others.

In the conditions of Uzbekistan, it is important to take into account the moisture (water) sensitivity of trees and shrubs. In this respect, they can be divided into three groups [2]:

1. Moisture-demanding plants: swamp cypress, ivalar, lapina, turanga poplar, black alder, and bosh.

2. Plants with moderate humidity requirements: Amur cork tree, downy birch, smooth elm, sycamore, Norway maple, small-leaved linden, magnolia, common ash, prickly spruce, silver spruce, berry yew.

3. Plants with low demand for moisture: Japanese quince, island elm, white acacia, amorpha, common trouser, hawthorn, glidichia, beta, prickly spruce, Virginia juniper, Cossack juniper, Crimean pine, Scots pine.

Trees and shrubs resistant to saline soils include saltwort, ginseng, tamarisk, saksaul, and soapberry, which have the ability to grow in chlorinated saline soils [3].

Ash, linden, laurel, European olive, etc., are demanding trees even on calcareous soil. Aylant (Chinese ash) can also grow in oil-contaminated soil. Therefore, if it is not possible to improve the soil when transplanting plants, the most correct approach is to choose a plant suitable for the existing soil.

Trees and shrubs growing on salty soils include the above-mentioned ash, linden, laurel, European olive, and aylant.

It is known that trees and bushes also protect areas from external environmental influences. At such times [4]:

To protect against noise, use Norway maple, common birch, small-leaved linden, common elm, Siberian larch, Tatar honeysuckle, yellow acacia, Siberian hawthorn.

To protect against gases, use Pennsylvania maple, Leshyna, horse chestnut, Manchurian, honey locust, gray or black poplar, Canadian poplar, white acacia, biota, white mulberry, Virginia juniper, Cossack juniper, oddium privet, felt linden, and others.

For protection from dust, it is recommended to choose elm, weeping white willow, horse chestnut, gray maple, Tatarian maple, field maple, Canadian poplar, Bolle poplar, white mulberry, green and common ash, yellow acacia, oddium privet, narrow-leaved oleaster, and Van-Gutt's spirea.

In order to block the wind and provide shade, it is recommended to choose densely branched trees such as common oak, horse chestnut, Norway and field maple, Odd spruce, English oak, honey locust, magnolia, small-leaved linden, etc.

When choosing plants for planting in groups, it is necessary to pay attention to their architectural-artistic features: height, external shape, color, and leaf characteristics. Especially, the height and appearance of the trees in the group should be in contrast or in nuanced relationships. [3]

- Compatibility of the selected plants with the functional goals of the greened open environment. For example, plants planted along the sidewalk of the main street must, first of all, be resistant to traffic noise, gas, and dust, create cool shade along the sidewalk, and provide an attractive landscape. Therefore, for the sidewalk, it is necessary to choose trees with a wide appearance, closely spaced branches, resistance to gas, dust, and noise, and, at the same time, an appealing aesthetic. On the other hand, for greening the promenade around a monument or memorial, the main green material should be a parterre-type decorative lawn or flower plants, combined with some low shrubs.
- Compatibility of the ecological characteristics of plants with the conditions of the environment where they are planted. It is necessary to consider the compatibility of newly selected plants with pre-existing decorative trees (if they are left) or the mutual biological compatibility of selected trees and shrubs; that is, ensuring that they do not harm each other's growth.

It is also necessary to take into account whether the selected plant (tree or shrub) is suitable for the natural-climatic conditions of the region.

Knowing the flowering time and flowering period of woody plants also greatly helps in choosing and using them appropriately: from early spring to the end of February–March: forsythia, Canadian redbud; in spring (April–May): roses; in summer (June–August): Albizia, Broussonetia splendens, Hibiscus catalpa, Hydrangea, Sophora, etc.; in autumn (September–November): Marchinian rose, lilac spirea, hibiscus [2].

In order to use a particular species in landscaping, it is necessary to know its negative characteristics in addition to its positive qualities. These include plants contaminating the area with

their fruits (poplar, mulberry), contaminating the area with their needles or leaves (plane tree, honey locust, yucca), or having poisonous fruits and leaves (Cossack juniper). It is forbidden to plant these species in kindergartens, schools, and children's parks.

When forming groups, it is necessary to take into account the growth and viability of the plants selected for the group; that is, fast-growing types of trees should not be planted next to slow-growing ones, and sun-loving plants should not be planted under shade trees.

It is important to use trees and shrubs in project work, to choose them for planting and creating green compositions, and to study and know their decorative qualities. One of these features is their natural shape — the wind-resistance and denseness of branches.

In order to fully and effectively use all the potential of planted plants, it is necessary to observe the following basic principles when choosing them [3]:

Landscape trees are generally divided into two groups according to their natural shape and appearance: geometric and non-geometric trees. The first group includes pyramidal, columnar (carrot-shaped), egg-shaped, spherical, and oval trees, while the second group includes branching, umbel-like, umbrella-like, tent-like, double, and scattered trees.

The shapes of trees and shrubs change depending on their age and the seasons. They can also be given various artificial shapes through pruning, i.e., cutting off their branches. In creating green compositions, in addition to the natural forms and height of plants, the density, size, pattern, and color of branches and leaves are also important. Beyond their leaves, it is important to pay attention to the decorative qualities of their flowers when choosing woody plants for landscaping. Among trees, magnolia, false chestnut, and acacia; among shrubs, Japanese quince, roses, lilac (siren), and forsythia have the ability to bloom beautifully and effectively.

Discussion part of the study: The article examines the selection of plants for planting in areas with unfavorable climate and soil. The practical importance of the research results is highlighted by the fact that, in the project organizations of our republic and Karakalpakstan, it is of great importance to green the areas of settlements with extreme climates, to use these results in developing project proposals for urban planning and landscape architecture for settlements in such conditions, and to implement them in practice.

BIOECOLOGICAL CHARACTERISTICS OF DOMINANT COLEOPTERA SPECIES IN THE USTYURT PLATEAU (KARAKALPAKSTAN SECTION) AND INTEGRATED CONTROL MEASURES AGAINST THEM

Tajetdinov M.M. Juginisov T.I
Karakalpak State University named after Berdakh, Nukus, Karakalpakstan, Uzbekistan
Email: tmuxammetdin@gmail.com

Summary: In this article, the Ustyurt Plateau (Karakalpakstan section) experiences severe aridification due to the Aral Sea crisis and climate change, leading to degradation of natural vegetation and increased pest pressure from Coleoptera (beetles). This study identifies the taxonomic composition, distribution, trophic links, and bioecological features of dominant Coleoptera species in natural and anthropogenically transformed habitats. Four key dominant pest species were recorded for the first time in the region: *Xylotrechus* (Rusticoclytus) *rusticus* (longhorn beetle on shrubs), *Trachypteris picta* (green buprestid), *Anobium pertinax* (wood-boring anobiid), and *Blaps lethifera* (darkling beetle). Their trophic preferences on herbaceous, semi-shrub, shrub, and tree plants (e.g., *Haloxylon aphyllum*, *Tamarix hispida*, *Sophora japonica*, *Aesculus hippocastanum*) were established. Integrated control trials using the entomopathogenic fungus *Beauveria tenella* (VD-85 strain) and the chemical insecticide Entolucha (20% s.k.) achieved 90.6 % biological efficacy under laboratory and field conditions. Physical-mechanical preventive measures also showed high effectiveness. The results provide a scientific basis for monitoring and ecologically safe pest management in arid ecosystems.

INTRODUCTION

The desiccation of the Aral Sea and progressive aridification of the Ustyurt Plateau have caused dramatic changes in natural ecosystems, including dieback of herbaceous, semi-shrub, and shrub vegetation. These processes have triggered outbreaks of phytophagous insects, particularly Coleoptera, which accelerate degradation of plant cover and threaten forage resources for livestock farming. The problem is exacerbated by anthropogenic transformation of landscapes (overgrazing, afforestation with saxaul, etc.). Despite global and national efforts (e.g., Uzbekistan's "Yashil makon" program and Aral Sea restoration initiatives), there is a lack of detailed data on the faunistic composition, dominance structure, and control strategies for Coleoptera pests in the Karakalpakstan section of Ustyurt. This study aims to investigate the bioecological characteristics of dominant Coleoptera species and develop integrated pest management approaches aligned with national priorities in ecology and sustainable agriculture.

EXPERIMENTAL RESEARCH

Field surveys were conducted in 2021–2025 across natural (desert-steppe, saxaul-dominated) and anthropogenically transformed (pastures, afforested areas) habitats of the Ustyurt Plateau (Karakalpakstan). Entomological collections were made using standard methods: sweeping nets, pitfall traps, light traps, and hand collection from host plants. A total of 52 Coleoptera species belonging to 14 families, 19 subfamilies, and 45 genera were identified. Taxonomic identification followed keys by Plavilshchikov (1994), Nikolaev & Kolov (2005), Izhikevich & Nikitsky (2005), and others. Dominance was assessed using abundance indices and frequency of occurrence. Trophic links were studied by direct observation of feeding and rearing larvae/adults on host plants. Laboratory bioassays evaluated the efficacy of the entomopathogenic fungus *Beauveria tenella* (VD-85 strain) and the insecticide Entolucha (20% s.k.) on dominant species. Field trials were carried out in 2024–2025. Data were statistically analyzed using Biostat 2007 software.[1,2]

RESEARCH RESULTS

A total of 52 Coleoptera species were recorded, with four species identified as dominant pests for the first time in the region:

- *Xylotrechus (Rusticoclytus) rusticus* (Cerambycidae) – feeds on shrubs (*Tamarix*, *Haloxylon*);
- *Trachypteris picta* (Buprestidae) – damages green parts of semi-shrubs;

- *Anobium pertinax* (Anobiidae) – wood-borer of trees and dead wood;
- *Blaps lethifera* (Tenebrionidae) – soil-dwelling, damages roots and seedlings.

These species showed high abundance in degraded pastures and afforested sites. Trophic specialization was confirmed: *X. rusticus* and *T. picta* prefer *Haloxylon aphyllum* and *Tamarix hispida*; *A. pertinax* attacks dead wood of *Aesculus hippocastanum*, *Sophora japonica*, etc.; *B. lethifera* is polyphagous on soil surface. Phenological calendars revealed peak activity in May–July (larval feeding) and August–September (adult emergence).

The fact that most of the insects of the genus Coleoptera (Linnaeus, 1758) of the Karakalpak branch of the Ustyurt Plateau live secretly inside plant stems during larval and adult stages, the formation of improved nests creates some difficulties in carrying out improved preventive control measures against them. From this point of view, during the experiments, taking into account these circumstances, it was deemed expedient to check the biological effectiveness of control in laboratory conditions to ensure the complete extinction of the dominant species of the genus Coleoptera (Linnaeus, 1758) *Xylotrechus* (Rusticoclytus) *rusticus* (Linnaeus, 1758) - shrub beetle, *Trachypteris picta* (Pallas, 1773) - green glossy beetle, *Anobium pertinax* (Linnaeus, 1758) - building wood rodent, *Blaps lethifera* (Mars., 1802) - broad-chested soil beetle.[3,4]

Biological agent - entomopathogenic microorganism strain VD-85 of the fungus *Beauveria tenella* (Patent No IDP 04692 dated 23.03.2001). In the conditions of Uzbekistan, it was isolated from the Asian locust disease by A.A. Nurzhanov and others. This biological agent, the preparation "Biofirin" prepared on the basis of the VD-85 strain of the fungus *Beauveria tenella*, was used in laboratory conditions to control the dominant species of the genus Coleoptera (Linnaeus, 1758) *Xylotrechus* (Rusticoclytus) *rusticus* (Linnaeus, 1758) - bush beetle, *Trachypteris picta* (Pallas, 1773) - green glossy beetle, *Anobium pertinax* (Linnaeus, 1758) - building wood rodent, *Blaps lethifera* (Mars., 1802) - broad-chested soil beetle.

In this case, plant samples initially severely damaged by insect pests were stored in mesh screens at room temperature ($+20^0$C, $+22^0$C) and observation was carried out for 3 months, then adult insects from the plants were placed in desiccators. Also, in early spring, in field conditions, insect collection was carried out by wrapping adhesive films on the surface of plants. Dominant species were isolated from all collected insect samples and used in laboratory experiments.

In conclusion, it was noted that the preparation "Biofirin" prepared on the basis of the VD-85 strain of the entomopathogenic microorganism fungus *Beauveria tenella*, was highly effective against the dominant species of *Xylotrechus* (Rusticoclytus) *rusticus* (Linnaeus, 1758) - bush beetle, *Trachypteris picta* (Pallas, 1773) - green glossy beetle, *Anobium pertinax* (Linnaeus, 1758) - house wood rodent, which amounted to 88%-91%, and the average biological effectiveness was 73.5% compared to *Blaps lethifera* (Mars., 1802) - broad-chested soil beetle.[6,9]

Biological effectiveness of the biological preparation "Biofirin" against dominant species of insect pests of the genus Coleoptera (Linnaeus, 1758) of the Karakalpak branch of the Ustyurt Plateau under laboratory conditions.

During the research, laboratory experiments were conducted, and based on a comparative analysis of the results obtained with the "Biofirin" preparation, chemical protection measures were applied against dominant pest insects belonging to the order Coleoptera (Linnaeus, 1758) in herbaceous, semi-shrub, and shrub plants of the flora of Uzbekistan in the Qoraqalpog'iston section of the Ustyurt Plateau.

The target pest species included *Xylotrechus* (Rusticoclytus) *rusticus* (Linnaeus, 1758) – longhorn beetle of shrub plants, *Trachypteris picta* (Pallas, 1773) – green shining beetle, *Anobium pertinax* (Linnaeus, 1758) – common furniture beetle, and *Blaps lethifera* (Mars., 1802) – broad-breasted darkling beetle.

For pest control, chemical preparations "Sermit" (10%) suspension emulsion, "Enjio" (24%) wettable powder, and "Entolucha" (20%) wettable powder were applied at a concentration of 0.005%.

The application of chemical preparations was carried out by dissolving them in water and spraying, which is widely practiced in many regions of the world in field areas and anthropogenically transformed sites to protect forage plants used in livestock farming from pests. The preparations penetrate plant tissues in fine droplets, remain within the plant body for 3–5 weeks, cause severe damage to all parts of the pest's body including chitin-synthesizing tissues, disrupt feeding processes, and strongly damage the lymph nodes and cuticle. Therefore, these preparations are widely used in preventive measures against pest insects of various crop types.

According to the experimental results, working aqueous solutions of the chemical preparations "Sermit" (10% suspension emulsion), "Enjio" (24% wettable powder), and "Entolucha" (20% wettable powder) at a concentration of 0.005% were applied by spraying against dominant pest species of four plant types in the plain. The target pests included *Xylotrechus* (Rusticoclytus) *rusticus* (Linnaeus, 1758) – longhorn beetle of shrub plants, *Trachypteris picta* (Pallas, 1773) – green shining beetle, *Anobium pertinax* (Linnaeus, 1758) – common furniture beetle, and *Blaps lethifera* (Mars., 1802) – broad-breasted darkling beetle. Observations were carried out for 3–15 days.

During the initial 3–10 days, the effectiveness of the preparations against insects was relatively weak; however, by the 15th day, a high mortality rate of pests was recorded.

Throughout the experiment, 40 insect specimens were used for each treatment variant. According to the obtained results, the effectiveness of the preparations was as follows. The highest efficacy was observed with "Entolucha" (20% wettable powder). Within 15 days, mortality rates were recorded as: *Anobium pertinax* (Linnaeus, 1758) – 86.0% (34.4 ± 0.6), *Trachypteris picta* (Pallas, 1773) – 83.0% (33.2 ± 0.6), *Xylotrechus* (Rusticoclytus) *rusticus* (Linnaeus, 1758) – 81.0% (32.4 ± 0.7), and *Blaps lethifera* (Mars., 1802) – 63.5% (25.4 ± 0.5). The overall mean biological efficacy of this preparation was 78.4%.

For the "Enjio" (24% wettable powder) preparation, the 15-day results showed mortality rates of 84.2% (33.6 ± 0.6) for *Anobium pertinax*, 80.7% (32.3 ± 0.5) for *Xylotrechus (Rusticoclytus) rusticus*, 78.5% (31.4 ± 0.5) for *Trachypteris picta*, and 65.5% (26.2 ± 0.4) for *Blaps lethifera*, with an average biological efficacy of 77.2%.

In the 15-day results of "Sermit" (10% suspension emulsion), lower mortality rates were observed: *Trachypteris picta* – 67.5% (27.0 ± 0.5), *Anobium pertinax* – 66.2% (26.5 ± 0.5), *Xylotrechus* (Rusticoclytus) *rusticus* – 63.0% (25.2 ± 0.4), and *Blaps lethifera* – 55.7% (22.3 ± 0.4), resulting in the lowest average efficacy of 63.1%.

Additionally, *Blaps lethifera* (Mars., 1802) consistently showed the lowest mortality rates across all three preparations, ranging from 55.7% to 65.5%.

In the control group (treated with water only), no insect mortality was observed during the 15-day period, with 100% survival (40.0 ± 0.1), which fully confirms that all recorded mortality was solely due to the effects of the applied chemical preparations.[9,10]

Biological effectiveness of chemical preparations against harmful insects of the dominant species of the genus Coleoptera (Linnaeus, 1758) of the Karakalpak branch of the Ustyurt Plateau under laboratory conditions.

CONCLUSIONS

The Ustyurt Plateau (Karakalpakstan) hosts 56 Coleoptera species, with four newly recorded dominant pests (*X. rusticus, T. picta, A. pertinax, B. lethifera*) causing significant damage to forage and afforested plants. Climate aridification and anthropogenic pressure have increased pest outbreaks and expanded their trophic niches. Integrated control combining *Beauveria tenella* (biological) and Entolucha (chemical) provides 90.6% efficacy and is ecologically safer than broad-spectrum insecticides. Physical-mechanical preventive measures are highly effective and recommended for sustainable management in arid ecosystems. The obtained data support monitoring programs and contribute to national strategies for Aral Sea region restoration and biodiversity conservation.

THE INCIDENCE OF GALLSTONES AND BILIARY TRACT DISEASES AMONG THE POPULATION OF THE REPUBLIC OF KARAKALPAKSTAN AND ITS CORRELATION WITH ENVIRONMENTAL FACTORS

Turdimambetov I.R., Utarbaeva K.A.
Karakalpak State University named after Berdakh

Summary: *This research examined the patterns of gallstone and biliary tract disease outbreaks in the Republic of Karakalpakstan between 2009 and 2021, as well as how these outbreaks relate to environmental factors, particularly chemical contamination of drinking water. The analysis revealed a correlation between the levels of contamination of open water reservoirs, tap water, and well water and morbidity rates using the Pearson correlation method and Student's t-test. The results showed that as the level of chemical contamination of water increases, the incidence of gallstones and biliary tract diseases also increases. The highest correlation was noted with well water pollution (r = 0.66). No statistically significant correlation was found with air pollution. In the Aral Sea region, especially in the northern, western, and central zones of Karakalpakstan, providing the population with quality drinking water can have a significant positive impact on reducing these diseases.*

Key words: *Aral Sea region, drinking water, chemical pollution, gallstones and biliary tract diseases, correlation.*

INTRODUCTION. The Republic of Karakalpakstan's population's health has been seriously threatened in recent years due to the ecological disaster in the Aral Sea region. As a result of the depletion of water resources and the pollution of air, soil, and water, a trend towards an increase in various chronic diseases is observed. One of them is gallstones and biliary tract diseases. The causes of these diseases are numerous, and one of the main factors is the poor quality and disruption of the chemical composition of drinking water. In Karakalpakstan, water sources in most cases rely on rivers and groundwater flowing through the dried-up areas of the Aral Sea. The salts, metals, and other harmful elements in their composition disrupt metabolic processes in the body, creating conditions for the formation of gallstone.

MATERIALS AND METHODS. In scientific sources, it is noted that the high content of nitrates, sulfates, heavy metals (in particular, iron, manganese, lead) in water negatively affects the function of the liver and biliary tract. Meanwhile, water resources in the Aral Sea region are saline and polluted, which exacerbates the incidence of diseases. Previous studies have shown that the mineralization of drinking water reaches 2-3 g/l, which is 3 times higher than the physiological norm. This increases the risk of gallstone formation in the long term. The research was conducted in the period from 2009 to 2021 in the Western, Northern, Central, and Southern zones of the Republic of Karakalpakstan. The data were taken from the statistical database of the Ministry of Health of the Republic of Karakalpakstan. Based on disease indicators per 100,000 population:

Annual dynamics of gallstones and biliary tract diseases; The correlation of drinking water (open reservoirs, tap water, well water) with the level of chemical pollution was determined and assessed using Pearson's correlation coefficient (r) and Student's t-test.

RESULTS AND DISCUSSION. In the course of the study, the indicators of the overall prevalence of gallstones and biliary tract diseases in Karakalpakstan for the period 2009-2021 were analysed. If in 2009 the morbidity rate per 100,000 population was 0.49, then by 2021 this indicator increased to 0.80. During this period, there was a 1.6-fold increase in the number of diseases, which clearly shows the impact of environmental factors on health in the region.

In order to achieve clarity in illuminating the dynamics of gallstone disease, two five-year periods were separated from the period 2009-2021, consisting of 2011-2015 and 2016-2020, and their average five-year indicators were compared (Table 1).

Table 1

Indicators of gallstones and biliary tract diseases of the population of the Republic of Karakalpakstan by medical-geographical zones (per 100 thousand population)

By medical-geographical zones of cities and districts	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021

Table compiled by the author based on data from the Ministry of Health of the Republic of Karakalpakstan

Note. 1. Bozatau District was abolished in 2004 and re-established in 2019. 2. The city of Takhiatash was a city subordinate to the Republic of Karakalpakstan until 2013. In 2013, the city of Takhiatash was incorporated into the Khodjeyli district. In 2017, part of the territory of the Khodjeyli district was transformed into the Takhiatash district.

Between 2009 and 2021, Pearson's method was used to calculate the correlation between the chemical pollution of drinking water (water from open reservoirs, tap water, and well water) and the markers of gallstones and biliary tract diseases. The reliability of the obtained results was assessed using the Student's t-test. In 2011-2020, a direct average reliable correlation between the indicators of gallstones and biliary tract diseases and the level of chemical contamination of water in open water reservoirs was revealed in the Western zone itself r_{xy}=0.35 (with Student's t-test t=6.95 and p=0.95), while in the period 2009-2021, such a correlation was not found.

2009-2021 yillarda o‘t toshi va o‘t yo‘llari kasalliklari ko‘rsatkichlarining ochiq suv havzalari suvi kimyoviy ifloslanishi darajasi bilan to‘g‘ri kuchli haqqoniy korrelyatsion bog‘lanishi Markaziy zonada r_{xy}=0,77 (Styudent testi t=4,07 va p=0,95 bo‘lganda) aniqlangan bo‘lsa, shu davrda to‘g‘ri o‘rtacha haqqoniy bog‘lanish shu zonaning Nukus shahrida r_{xy}=0,45 (Styudent testi t=4,67 va p=0,95 bo‘lganda) va Nukus tumanida r_{xy}=0,37 (Styudent testi t=1,45 va p=0,8 bo‘lganda) aniqlandi. In 2009-2021, a direct strong reliable correlation between the indicators of gallstones and biliary tract diseases and the level of chemical contamination of water in open water reservoirs was revealed in

the Central zone r_{xy}=0.77 (with Student's t-test =4.07 and p=0.95), while a direct average reliable correlation was revealed in the same zone in the city of Nukus r_{xy}=0.45 (with Student's t-test t=4.67 and p=0.95) and in the Nukus district r_{xy}=0.37 (with Student's t-test t=1.45 and p=0.8). In the city of Nukus, a direct average reliable correlation between these two indicators r_{xy}=0.64 (with Student's t-test t=4.51 and p=0.95) was also found in the period 2011-2021.

In 2009-2021, a direct average correlation of the indicators of gallstones and biliary tract diseases with the level of chemical contamination of water in open water reservoirs was revealed in the Khodjeyli district of the Central zone r_{xy}=0.49 (with Student's t-test t=4.17 and p=0.95). In 2011-2020, a direct average reliable correlation of gallstones and biliary tract disease indicators with the level of chemical contamination of water in open water reservoirs was revealed in the Beruni district of the Southern zone r_{xy}=0.37 (with Student's t-test t=5.12 and p=0.95) (Table 2)

Table 2

Dynamics of gallstones and biliary tract diseases by medical-geographical zones (per 100 thousand population)

Zones	2011-2015	2016-2020	Increase/decrease
Western zone	0,3	0,7	+2.3 times
Northern zone	0,14	0,2	+42 %
Central zone	1,04	1,1	+6%
Southern zone	0,38	0,44	+16 %
Karakalpakstan	0,29	0,39	+34 %

The table was compiled by the author based on data from the Ministry of Health of the Republic of Uzbekistan.

Compared to the first five years, the average indicators of gallstones and biliary tract diseases in the next five years showed a growth trend in Karakalpakstan and in all zones.

In 2009-2021, a direct strong reliable correlation was revealed between the indicators of gallstones and biliary tract diseases and the level of chemical contamination of water in open water reservoirs in the Republic of Karakalpakstan r_{xy}=0.45 (with Student's t-test t=8.48 and p=0.95).

Consequently, it was determened that the higher the chemical contamination of well water in the Kungrad, Kanlikul, and Shumanay districts of the Western zone and in the Western zone itself, in the Northern zone itself and in the Karauzek and Chimbay districts of this zone, in the Nukus district of the Central zone, in the Amudarya district of the Southern zone, and in the Republic of Karakalpakstan, the higher the incidence of gallstones and biliary tract diseases.

According to the results of the regional analysis, the districts with the highest levels of diseases were:

An analysis of two five-year periods (2011-2015 and 2016-2020) between 2009 and 2021 revealed an increase in disease rates in all zones. In particular, an increase of 2.3 times was recorded in the Western zone, 42% in the Northern zone, 6% in the Central zone, 16% in the Southern zone, and 34% in the entire Republic of Karakalpakstan. This increase was attributed primarily to changes in the chemical composition of drinking water and environmental degradation in the region. The highest rates of gallstone disease are in the Muynak (2017 - 3.03 people; 2018 - 1.7 people; 2019 - 2.95 people), Kungrad (2009 - 1.7 people) and Shumanay (2009 - 1.1 people) districts of the Western zone, in the Western zone itself (2017 - 1.02 people), in the Karauzek district of the Northern zone (2020 - 1.04 people), in the Nukus district of the Central zone (2017 - 1.53 people; 2019 - 1.47 people; 2020 - 1.5 people), in the Amudarya district of the Southern zone (2009 - 6.9 people; 2010 - 1.25 people; 2011 - 1.31 people; 2012 - 1.71 people; 2017 - 1.13 people; 2018 - 1.28 people; 2019 - 1.09 people; 2020 - 1.13 people and 2021 - 1.29 people), in the Southern zone itself (2009 - 1.98 people).

Water pollution correlation analysis. The correlation between the indicators of gallstones and biliary tract diseases and the degree of chemical contamination of water was determined by the Pearson correlation method and statistically assessed using the Student's t-test.

Water pollution of open water reservoirs:

In the western zone, a moderate positive correlation (r = 0.35; t = 6.95; p = 0.95) was found between 2011 and 2020.

A strong correlation was noted in the central zone (r = 0.77; t = 4.07; p = 0.95).

At the level of the Republic of Karakalpakstan, this indicator was (r = 0.45; t = 8.48; p = 0.95).

There is a moderate correlation (r = 0.64) in Nukus city, where the incidence rate has increased proportionally as water pollution has increased.

Pollution of tap water (water supply):

A statistically significant correlation was found in the Kungrad (r = 0.46) and Kanlikul (r = 0.57) districts of the Western zone, in the Nukus district of the Central zone (r = 0.58), in the Ellikkal district of the Southern zone (r = 0.30), and in the entire zone (r = 0.37). These results indicate that the deterioration of the sanitary and hygienic quality of drinking water is an important factor in the growth of diseases.

Well water pollution:

A positive correlation was noted in the Muynak (r = 0.34), Kanlikul (r = 0.51), Kungrad (r = 0.30) districts of the western zone and throughout the entire zone (r = 0.49). In the northern zone, a strong correlation was revealed in the Karauzek district (r = 0.75), which is the highest correlation indicator. A moderately strong positive correlation was noted in the Amudarya district of the southern zone (r = 0.65) and throughout Karakalpakstan (r = 0.66). These data indicate that chemical contamination of well water (in particular, mineral salts, heavy metals, and trace elements) significantly affects the development of gallstone disease.

1. Dynamics of morbidity (2009-2021) - if in 2009 there were 0.49 cases per 100,000 population, then in 2021 this indicator increased to 0.80.

Consequently, over 12 years, the growth was 1.6 times.

2. Territorial analysis - Highest indicators: Western zone: Muynak, Kungrad, Shumanay; Central zone: Nukus district; Southern zone: Amudarya district; Northern zone: Karauzek district.

Comparison of 2011-2015 and 2016-2020 showed a tendency towards an increase in morbidity in all zones.

3. Correlation with drinking water pollution

Open water reservoirs: strong correlation in the central zone (r = 0.77); Average correlation for the Republic of Karakalpakstan (r = 0.45). Tap water: Kungrad (r = 0.46), Kanlikul (r = 0.57), Nukus (r = 0.58). Well water: Karauzek (r = 0.75), Amudarya (r = 0.65), in the Republic of Karakalpakstan (r = 0.66).

The research results showed a significant correlation between chemical contamination of drinking water and gallstones and biliary tract diseases. Especially, pollution of well water was noted as the most important risk factor.Water sources in the Aral Sea region are often saline and contain high amounts of calcium, magnesium, chlorides, sulfates, and heavy metal ions. These elements increase the viscosity of bile, leading to the formation of stones in the gallbladder.

According to the results of the study, gallstones and biliary tract diseases in the Aral Sea region are directly related to environmental factors, especially the chemical composition of drinking water. In the western, central, and southern zones of the Republic of Karakalpakstan, a high content of sulfates, chlorides, calcium, magnesium, iron, and manganese has been established in water sources (open reservoirs, tap water and well water systems).

An excess of these substances intensifies metabolic disorders in the body, the thickening of bile, and the formation of gallstones. An increase in such diseases is observed, especially among the population who consume salty and brackish water for a long time.

Pollution of open water reservoirs is associated with dust and salt particles entering from the dried-up areas of the Aral Sea, and pollution of water supply is associated with obsolete pipes and inadequate operation of treatment facilities. Well water is the most chemically polluted source, especially since it passes through the sandy and saline layers of the Aral Sea region. This confirms that diseases are mainly associated with chemical components that enter the body through water.

CONCLUSIONS. When studying the impact of harmful environmental factors characteristic of the Aral Sea region, especially the consumption of polluted drinking water, on public health indicators, one of the most influential indicators was gallstones and biliary tract diseases. The dynamics of gallstones and biliary tract disease rates per 100,000 population in Karakalpakstan, its zones and districts, were studied in 2009-2021.

According to statistical data from the Ministry of Health of the Republic of Karakalpakstan, in 2009 the incidence of gallstones and biliary tract diseases was 0.49 per 100,000 population, and in 2021 it was 0.80.

Therefore, the decrease in water quality is a leading ecological factor in the growth of gallstones and biliary tract diseases in the Aral Sea region. During 2009-2021, gallstones and biliary tract diseases showed a growth trend in the Republic of Karakalpakstan. As the level of chemical contamination of drinking water increases, the incidence of diseases also increases. The composition of well and tap water showed the highest correlation with morbidity (r = up to 0.66). No significant impact of atmospheric air pollution on the disease was identified. In the Aral Sea region, especially in the Western and Northern zones, it is possible to reduce gallstones and biliary tract diseases by improving the provision of quality drinking water to the population.

Qoraqalpogistonda atrof-muhit ifloslanishi va birlamchi kasallanish ortasidagi bog‘liqlik (2009-2021 yillar tahlili) – “Geografiyanin’ actual mashqalalari ham perspektivalari” respublikaliq ilimiy-ameliy konfereciyasi. Nukus-2025 j. 21-22 oktyabr. Doi. *https://doi.org/10.5281/zenodo.17392783* [Correlation between environmental pollution and primary morbidity in Karakalpakstan (analysis for 2009-2021) - Republican scientific and practical conference "Actual problems and prospects of geography." Nukus-2025 October 21-22.]

Rezyume: *Mazkur maqolada 2009–2021 yillar oralig‘ida Qoraqalpog‘iston Respublikasida o‘t toshi va o‘t yo‘llari kasalliklarining tarqalish dinamikasi hamda ularning ekologik omillar, ayniqsa ichimlik suvining kimyoviy ifloslanishi bilan o‘zaro bog‘liqligi o‘rganildi. Tahlil jarayonida Pirson korrelyatsiya usuli va Styudent t-testi yordamida ochiq suv havzalari, vodoprovod va quduq suvining ifloslanish darajalari bilan kasallanish ko‘rsatkichlari o‘rtasidagi bog‘lanish aniqlangan. Natijalar shuni ko‘rsatdiki, suvning kimyoviy ifloslanishi darajasi oshgan sari o‘t toshi va o‘t yo‘llari kasalliklari bilan kasallanish soni ham ortgan. Eng yuqori bog‘lanish quduq suvi ifloslanishi bilan qayd etildi (r = 0,66). Atmosfera havosi ifloslanishi bilan esa statistik ahamiyatli bog‘lanish topilmadi. Orolbo‘yi hududida, ayniqsa Qoraqalpog‘istonning shimoliy, g‘arbiy va markaziy*

zonalarda, aholiga sifatli ichimlik suvini yetkazib berish ushbu kasalliklarning kamayishiga sezilarli ijobiy ta'sir ko'rsatishi mumkin.

Резюме: *В данной статье исследуется динамика распространения желчнокаменной болезни и заболеваний желчевыводящих путей в Республике Каракалпакстан в период с 2009 по 2021 год, а также их взаимосвязь с экологическими факторами, особенно с химическим загрязнением питьевой воды. В ходе анализа с помощью метода корреляции Пирсона и t-критерия Стьюдента была выявлена связь между показателями заболеваемости и уровнями загрязнения открытых водоемов, водопроводной и колодезной воды. Результаты показали, что с увеличением уровня химического загрязнения воды возрастает и число случаев желчнокаменной болезни и заболеваний желчевыводящих путей. Наиболее сильная связь отмечена с загрязнением колодезной воды (r = 0,66). Статистически значимой связи с загрязнением атмосферного воздуха не обнаружено. В Приаралье, особенно в северной, западной и центральной зонах Каракалпакстана, обеспечение населения качественной питьевой водой может оказать существенное положительное влияние на снижение заболеваемости этими болезнями.*

Kalit so'zlar*: Orolbo'yi, ichimlik suvi, kimyoviy ifloslanish, o't toshi va o't yo'llari kasalliklari, korrelyatsiya.*

Ключевые слова: *Приаралье, питьевая вода, химическое загрязнение, желчнокаменная болезнь и заболевания желчевыводящих путей, корреляция.*

FAUNA, DISTRIBUTION MONITORING, AND MORPHOBIOLOGICAL CHARACTERISTICS OF COLEOPTERA (BEETLES) OF THE USTYURT PLATEAU, KARAKALPAKSTAN REGION

Summary: In this article, At present, **more than 400 insect species** have been recorded on the Ustyurt Plateau, of which over 50 species are endemic. Among them, 178 species belong to the order Coleoptera (Linnaeus, 1758), and 12–14 species are considered endemic.In addition, special attention has been given to the study of the taxonomic and faunistic analysis of the general insect fauna in agricultural agrocenosis fields for the production of essential food crops, and the dominance structure of these species has been investigated.From this perspective, the study of dominant pest species under natural sandy and desert plain conditions, as well as in anthropogenically transformed arid territories and agrocenosis fields, is of significant importance.

INTRODUCTION

When studying the distribution and taxonomic composition of insects belonging to the order Coleoptera (Linnaeus, 1758) within the natural ecosystem of the Karakalpakstan section of the Ustyurt Plateau, a total of 52 insect species belonging to 14 families and 19 subfamilies were recorded. These insects were found to be distributed mainly in the northern, central, and southern parts of the plateau, as well as in the desert sandy, saline soils, and anthropogenically transformed arid territories of the dried bottom of the Aral Sea. The distribution of insects depends on the climatic conditions, soil types, and plant flora of the plateau, and is primarily associated with xerophytic plant species, such as saxaul, tamarisk, Calligonum, Haloxylon, Salsola, and others. The taxonomic unity of Coleoptera species was studied in relation to the degree of pest activity on plant species of the flora of Uzbekistan. The dominant species include *Xylotrechus* (Rusticoclytus) *rusticus* (Linnaeus, 1758) – a longhorn beetle of shrub vegetation, *Trachypteris picta* (Pallas, 1773) – a green metallic beetle, *Anobium pertinax* (Linnaeus, 1758) – the common furniture beetle, and *Blaps lethifera* (Mars., 1802) – a broad-chested darkling beetle. These species are widespread across all regions of the plateau and cause damage to the wood, leaves, roots, and stems of plants.

EXPERIMENTAL RESEARCH

Field surveys were conducted in 2021–2025 across natural (desert-steppe, saxaul-dominated) and anthropogenically transformed (pastures, afforested areas) habitats of the Ustyurt Plateau (Karakalpakstan). Entomological collections were made using standard methods: sweeping nets, pitfall traps, light traps, and hand collection from host plants. A total of 52 Coleoptera species belonging to 14 families, 19 subfamilies, and 45 genera were identified. Taxonomic identification followed keys by Plavilshchikov (1994), Nikolaev & Kolov (2005), Izhikevich & Nikitsky (2005), and others.

RESEARCH RESULTS

Insects of the order Coleoptera (Linnaeus, 1758) were studied according to their taxonomic diversity based on the degree of pest damage to plant species of the flora of Uzbekistan. The dominant species were identified as Xylotrechus (Rusticoclytus) rusticus (Linnaeus, 1758) – a longhorn beetle of shrub plants, Trachypteris picta (Pallas, 1773) – a green metallic jewel beetle, Anobium pertinax (Linnaeus, 1758) – a wood-boring beetle damaging building timber, and Blaps lethifera (Mars., 1802) – a broad-chested darkling beetle (medlyak). These species are widespread throughout all regions of the plain and cause damage to the wood, leaves, roots, and stems of plants [1,2].

The geographical distribution of insects was studied in Northern Ustyurt (Jarinquduq depression, eastern escarpments of the Ustyurt plateau), Central Ustyurt (Borsakelmas depression), and Southern Ustyurt (Qorabovur upland, Koplonqir Plateau, Asakaovdan depression, and the north-

western parts of the Sarykamysh depression). In all regions of the plain, the insects were mainly associated with forage plants of the flora of Uzbekistan, including *Ammodendron* species (A. conollyi, A. floribundum, A. karelini, A. longiracemosum), *Salsola orientalis*, *Salsola arbuscula*, *Peganum harmala*, *Halothamnus subaphylla*, *Ephedra equisetina*, *Ephedra vulgaris*, *Ferula foetida*, *Artemisia absinthium*, *A. rutifolia*, *Salsola richteri*, *Salsola collina*, *Chenopodium album*, *Calligonium* spp., *Alhagi* species (A. canescens, A. persarum, A. pseudalhagi, A. sparsifolia), semi-shrub plants such as *Tamarix* species (T. hispida, T. laxa, T. leptostachys, T. androssovii, T. bungei, T. elongata, T. florida, T. hohenackeri, T. litvinovii, T. ramosissima (pentandra), T. szowitsiana), *Atraphaxis spinosa*, *Astragalus knorringianus*, *Halimodendron halodendron*, shrub plants including *Haloxylon aphyllum*, *H. persicum*, *H. ammodendron*, *Populus pruinosa*, and *Elaeagnus angustifolia*. Among these, *burgan*, *boyalich*, *saryqsazan*, *qumoq*, white saxaul, and black saxaul plants were dominant, and a high abundance of insects was observed on them.

In these areas, particularly in Northern Ustyurt on Neogene plateaus with gray-brown soils, representatives of the family Cerambycidae were more widely distributed on *burgan*, *boyalich*, and *saryqsazan* plants. In Central Ustyurt, in the saline soils of the Borsakelmas depression, representatives of the family Tenebrionidae were recorded on *qumoq*, *burgan*, and white saxaul plants. In Southern Ustyurt, in the Qorabovur upland and the Asakaovdan depression, representatives of the families Buprestidae and Anobiidae were found in large numbers on *burgan*, black saxaul, white saxaul, and *saryqsazan* plants.

During the research, the taxonomic composition of insects belonging to the order Coleoptera (Linnaeus, 1758) in the natural ecosystem of the Karakalpakstan section of the Ustyurt Plateau was found to comprise a total of 56 species. Of these, four species—Xylotrechus (Rusticoclytus) rusticus (Linnaeus, 1758), a longhorn beetle of shrub plants; Trachypteris picta (Pallas, 1773), a green metallic jewel beetle; Anobium pertinax (Linnaeus, 1758), a wood-boring beetle damaging building timber; and Blaps lethifera (Mars., 1802), a broad-chested darkling beetle (medlyak)—were identified as dominant species, while the remaining species were observed to be less widely distributed in the region.[3,5]

It was determined that the distribution of insects across the plain varies seasonally. Specifically, insect species exhibit increased activity in early spring and late autumn, whereas during summer, when air temperatures exceed +35 °C, their locomotor activity decreases. In some periods, in anthropogenically transformed areas, such as agrocenoses, livestock-grazing zones, and areas affected by water scarcity, an increase in insect abundance was observed due to human-induced factors, along with the emergence of new invasive species.

The distribution of insect species belonging to the order Coleoptera (Linnaeus, 1758) in the natural ecosystem of the Karakalpakstan section of the Ustyurt Plateau was analyzed based on their frequency of occurrence. [6,7]

Distribution and dominance levels of Coleoptera (Linnaeus, 1758) in the Karakalpakstan section of the Ustyurt Plateau

№	Family	Subfamily	Genus	Species	Distribution area	Selected host plants	Occurrence/frequency

Total:14		19	45	56	3	20	**4(+++),14(+), 35(++)**

Note - 1; + indicates very rare species (occurrence of 1 insect per 50 plants); ++ (50/++); +++ indicates rare species (50/+++); ++++ indicates dominant (permanent) species

As a result of the research, a total of 56 species belonging to the genus Coleoptera (Linnaeus, 1758) were identified in the Karakalpak Department of the Ustyurt Plateau, which are mainly divided into 14 families. In this case, representatives of the family with the largest number of species; Cerambycidae - 13 species, Buprestidae - 7 species, Chrysomelidae - 6 species, Scarabaeidae - 5 species, Curculionidae - 5 species were recorded, and 1-3 species were observed in representatives of 9 families.[8,9]

The research results showed that a total of 56 species belonging to the order Coleoptera (Linnaeus, 1758) were identified in the Karakalpakstan section of the Ustyurt Plateau, primarily distributed across 14 families. Among these, the families with the highest number of species were: Cerambycidae – 13 species, Buprestidae – 7 species, Chrysomelidae – 6 species, Scarabaeidae – 5 species, and Curculionidae – 5 species. In the remaining 9 families, 1–3 species were recorded per family.[10,11,15,18]

Moreover, only four species were found to be constantly and abundantly distributed in the Karakalpakstan section of the Ustyurt Plateau: *Xylotrechus rusticus* (Linnaeus, 1758) – longhorn beetle of shrubs, *Trachypteris picta* (Pallas, 1773) – green metallic jewel beetle, *Anobium pertinax* (Linnaeus, 1758) – wood-boring beetle of buildings, and *Blaps lethifera* (Marsham, 1802) – broad-chested darkling beetle. These dominant species are consistently present in all regions (Northern, Central, and Southern Ustyurt) and constitute the main components of the local xylophagous and saprophagous fauna.[16,17]

During the study, the host plant associations of these beetles were identified: Saxaul (*Haloxylon* spp.) – associated with 12 beetle species, Tamarix spp. – 9 species, Turanga (*Populus pruinosa*) and Elaeagnus angustifolia – 8 species, Alhagi spp. – 7 species, Artemisia spp. and Ferula foetida – 6 species, and Ammodendron spp. – 6 species of pest insects.

Additionally, the regional distribution and frequency of occurrence of Coleoptera species in the Karakalpakstan section of the Ustyurt Plateau.

CONCLUSIONS

Overall, in the Karakalpakstan section of the Ustyurt Plateau, across the three selected study areas—Northern Ustyurt Plateau (Jarinquduq Depression and eastern escarpments of the Ustyurt), Central Ustyurt Plateau (Borsakelmas Depression), and Southern Ustyurt Plateau (Qorabovur, Koplonqir Plateau, Asakaovdan Depression, and the northwestern part of the Sarykamysh Depression)—as well as in anthropogenically transformed sites such as Qung‘irot district, Qaraqalpakstan, Qirq Qiz, Elabad, and Ustyurt natural-geographical regions, the dominant Coleoptera (Linnaeus, 1758) species were mainly associated with specific host plants. These include *Scirpus affinis* in pastures, *Ammodendron species* (*A. conollyi, A. floribundum*) – sand acacia, *Salsola orientalis* – keyreuk, *Salsola arbuscula* – boyalish, *Halothamnus subaphylla* – chogon (halophytes), *Ferula* foetida – kovrak, *Salsola richteri* – cherkez, *Alhagi species* (A. canescens, *A. persarum, A. pseudalhagi, A. sparsifolia*) – yantoq shrubs, Haloxylon species (H. aphyllum, *H. persicum, H. ammodendron*) – saxaul, *Populus* pruinosa – turanga, and *Elaeagnus angustifolia* – jiyda. These host plants were recorded as the main habitats for the dominant beetle species in the region.

TECHNICAL SCIENCES

TECHNOLOGY FOR OBTAINING LEAD-CONTAINING LOW-TEMPERATURE FIRED TRANSPARENT GLASSES

Tursunova S.T., Kudyarova K.K., Adinayev X.A.
Karakalpak State University named after Berdakh

Summary: *This study investigates the technological principles of producing low-temperature fired transparent glasses based on the SiO_2–PbO–BaO–K_2O oxide system. The influence of PbO content on melting temperature, viscosity, optical density, and refractive index was analyzed. Results indicate that increasing PbO content reduces the melting temperature, decreases viscosity, and improves the optical properties of the glass. Furthermore, local raw materials from the Republic of Karakalpakstan (Qongirot sands, Tortkol barite) were found suitable for practical application of the technology.*

Key words: lead glass, low-melting glass, transparent glass, glass production technology, melting and fining, annealing process, optical properties, mechanical properties, energy-efficient glass.

1. Introduction

The glass industry today is closely related to energy efficiency, environmental safety, and high-quality standards. Traditional silicate glasses are melted at 1450–1550 °C, which requires significant energy. Therefore, the production of low-temperature fired glasses is a topical and promising direction.

Lead oxide (PbO) acts as a network modifier in the amorphous structure of glass. Pb^{2+} ions partially break Si–O–Si linkages, reduce viscosity, and lower the melting temperature. In addition, PbO provides high refractive index and optical density, making it suitable for electronics, optics, and decorative glass.

Using local raw materials, such as Qongirot sands and Tortkol barite in Karakalpakstan, makes the technology economically efficient. Simultaneously, due to PbO toxicity, waste treatment and environmental protection measures are necessary.

Aim of the study: To investigate the technology of producing lead-containing low-temperature fired transparent glasses, to determine the effect of PbO on melting temperature, viscosity, optical density, and refractive index, and to evaluate the potential of local raw materials.

2. Materials and Methods

2.1. Raw Materials (Expanded)

For the experiments, high-purity oxides and carbonates were selected. Each component's physicochemical properties, technological role, and influence on glass structure are described below:

1. **SiO_2 (Silicon Dioxide)**

Role: Main network-forming agent.

Physicochemical Properties: Can be crystalline or amorphous; exhibits high thermal stability and chemical inertness.

Technological Influence: Forms the primary network of the glass, determining optical transparency and mechanical stability.

Local Raw Materials: Sands from Qo'ng'irot region (SiO_2 93–95 %, Fe_2O_3 <0.3 %) provide high-quality network formation. Minimal purification enables compliance with industrial standards.

Preparation: Dried, milled, and sieved to a uniform particle size of 50–200 μm.

2. **PbO (Lead Oxide)**

Role: Lowers melting temperature, increases optical density and refractive index.

Physicochemical Properties: Soft solid, high density (9.53 g/cm³), low melting point (~888 °C); enhances transparency in the amorphous state.

Technological Influence: Pb^{2+} ions partially disrupt Si–O–Si bonds, reducing viscosity and increasing fluidity. Raises refractive index to 1.62–1.76, ensuring bright and transparent glass.

Safety Considerations: Toxic; handling requires dust and vapor filtration.

3. **$BaCO_3$ (Barium Carbonate)**

Role: Improves mechanical strength and stabilizes optical properties.

Physicochemical Properties: Ba^{2+} ions strengthen the glass network, reduce thermal expansion, and enhance stress resistance.

Local Raw Materials: To‘rtko‘l barite ($BaSO_4$ 85–90 %, organic content <1 %) can be carbonated to produce BaO.

Technological Influence: Reduces risk of devitrification at low temperatures and enhances optical clarity.

4. **Alkali Oxides (K_2CO_3 and Na_2CO_3)**

Role: Facilitate melting, enhance fluidity and diffusion.

Physicochemical Properties: Low melting point (~850–900 °C), high ionic mobility; improves chemical stability of glass.

Technological Influence: Increases glass fluidity, ensures homogeneous, bubble-free melt.

Preparation: Dried, homogenized, particle size 20–80 μm.

Drying and Mixing:

Raw materials were dried at 110 °C for 2–4 hours, then mixed in a mechanical mixer for uniformity. Uniform particle size is crucial for network formation and stable melt during the melting process.

Additional Scientific Note:

PbO and alkali oxides partially disrupt the SiO_2 network, promoting low-temperature fluid formation. BaO stabilizes the network, maintaining optical and mechanical properties. PbO toxicity necessitates environmental monitoring and effective waste treatment systems.

2.2. Composition and Granulometry

For the experiments, the following compositions in the SiO_2–PbO–BaO–K_2O system were selected to control melting characteristics, viscosity, optical quality, and mechanical stability:

Component	Content (%)	Technological Role	Recommended Particle Size (μm)
SiO_2	45	Main network former; forms the skeleton of the glass, determining optical transparency and mechanical strength	50–200
PbO	35	Lowers melting temperature; increases optical density and refractive index; controls viscosity and fluidity	40–150
BaO	10	Enhances mechanical and thermal stability; reduces risk of devitrification	30–100
K_2O/Na_2O	10	Facilitates melting, reduces bubble formation, enhances diffusion	20–80

Scientific Notes and Technological Recommendations

1. **SiO_2**: Large particle sizes (50–200 μm) improve structural stability but can slow down melt formation. Therefore, a medium particle size (100–150 μm) is considered optimal.

2. **PbO**: Reduces the melting temperature and accelerates melt fluidity. Pb^{2+} ions partially break the Si–O–Si network, lowering viscosity and enhancing transparency. Particle size (40–150 μm) significantly affects melting rate and optical clarity.

3. **BaO**: Reduces devitrification risk and improves mechanical strength. Particle size range 30–100 μm is recommended; smaller particles increase surface area and promote homogeneous melt, while larger particles may slow down melting.

4. **Alkali oxides (K_2O, Na_2O)**: Facilitate melting and ensure uniform fluidity. Optimal particle size is 20–80 μm. Very fine particles may generate dust, while overly coarse particles may not fully dissolve during melting.

Mixing and Homogeneity

- All components are dried at 110 °C to remove moisture.

The mixture is then mechanically mixed for 30–60 minutes to achieve homogeneity. Homogeneous mixture ensures stable fluidity, minimal bubble formation, and reduced defects during melting.

- Particle size distribution significantly affects glass transparency and refractive index.

Scientific Analysis:

Optimal combination of particle size and composition ratios determines the quality of low-temperature fired glasses. Increasing PbO and alkali content enhances fluidity, whereas BaO maintains structural stability. SiO_2 particle size and purity define optical clarity and mechanical properties.

2.3. Melting and Annealing Process

- **Melting:** Platinum crucible at 1300–1350 °C for 3 hours. Refining to remove bubbles.
- **Annealing:** 500 °C for 2 hours to reduce internal stress and improve transparency.
- **Cooling:** Gradual extraction from the furnace at 20–25 °C/hour.

To ensure low-temperature firing and high transparency of glass, the following technological steps were applied:

Melting

Furnace Type: Platinum or ceramic crucibles were used.

Temperature: 1300–1350 °C, optimal for glasses containing 30–35 % PbO.

Duration: 3 hours, until complete melt homogenization.

Refining: Removal of bubbles and gas residues from the melt. This is achieved through controlled temperature cycling, slightly increasing and then reducing temperature to release trapped gases.

Technological Note: Increasing PbO content reduces the melting temperature and accelerates melt fluidity, but may increase bubble formation. Refining is crucial to obtain bubble-free, optically clear glass.

Annealing

Temperature: 500 °C, chosen to reduce internal stresses and improve light transmittance.

Duration: 2 hours, allowing atoms and ions in the network to reach a stable position.

Technological Effect: Annealing enhances mechanical strength, improves optical transmittance, and minimizes crystallization risk.

Cooling

Method: Slow extraction from the furnace at 20–25 °C per hour.

Technological Note: Rapid cooling may create internal stress, causing cracks or bubble formation. Slow cooling reduces devitrification risk and maintains structural stability.

Process Scheme (Textual)

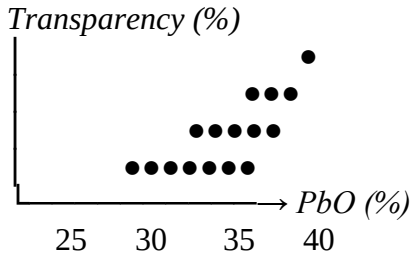
Raw materials → Drying (110 °C) → Mixing → Melting (1300–1350 °C, 3 hours) → Refining (bubble removal) → Annealing (500 °C, 2 hours) → Cooling (20–25 °C/h) → Finished glass

Scientific Notes

PbO Effect: Increasing PbO lowers the melting temperature, decreases viscosity, and accelerates fluid formation. However, it may also increase bubble and defect formation, making refining essential.

Annealing: Stabilizes the amorphous network, reduces internal stresses, and enhances optical clarity.

Cooling: Optimal cooling rate minimizes devitrification and cracking, ensuring high-quality glass.



3. Results

3.1. Melting Temperature and Viscosity

PbO (%)	Melting Temperature (°C)	Viscosity (Pa·s)	Transparency (%)	Refractive Index (n)
25	1400	$10^{4.5}$	85	1.62
30	1360	$10^{4.2}$	90	1.68
35	1330	$10^{3.8}$	94	1.72
40	1300	$10^{3.6}$	97	1.76

PbO increase reduces melting temperature, decreases viscosity, and enhances transparency and refractive index.

3.2. Optical Transparency

3.3. Thermal Analysis

DSC analysis showed:

- Softening temperature: 550 → 490 °C (PbO 25 → 40 %);
- Crystallization temperature increases for PbO > 40 %, indicating devitrification risk.

3.4. Analysis of Local Raw Materials

Qo‘ng‘irot sands: SiO_2 93–95 %, Fe_2O_3 <0.3 % **To‘rtko‘l barite:** $BaSO_4$ 85–90 %, organic and water content <1 %

Minimal purification makes these materials suitable for industrial standards.

4. Discussion

PbO modifies the glass network. Pb^{2+} ions alter bond angles, simplifying melting and improving optical properties. Optimal PbO content is 30–35 % for high transparency and structural stability.

5. Conclusion

Technological Outcomes:

Low-temperature fired transparent glasses in the SiO_2–PbO–BaO–K_2O system can be melted at 1300–1350 °C. For PbO content of 30–35 %, the melting temperature significantly decreases, viscosity is reduced, and melt fluidity increases. Refining and annealing processes minimize bubbles and defects, ensuring high-quality glass.

Optical and Mechanical Properties:

Glass transparency reaches 94–97 %.

Refractive index ranges from 1.68 to 1.72, providing high optical density.

Annealing reduces internal stresses, improves mechanical strength, and minimizes cracking risk.

Efficiency of Local Raw Materials:

Qo‘ng‘irot silica sands and To‘rtko‘l barite meet industrial standards with minimal purification. Utilizing these regional resources enhances technological and economic efficiency, reduces import dependency, and lowers production costs.

Energy Efficiency:

Low-temperature melting reduces energy consumption by 12–15 % compared to conventional 1450–1550 °C processes. Controlling PbO content and particle size ensures stable and efficient melting.

Environmental Considerations:

Due to PbO toxicity, proper waste treatment and filtration systems are essential. Using local raw materials reduces transportation costs and carbon footprint. Future studies on eco-friendly Pb-free systems are recommended.

Scientific and Practical Significance:

Scientific: The effects of PbO and BaO content on structure and optical properties in low-temperature glasses were investigated in detail.

Practical: Application of local raw materials in Karakalpakstan enables energy- and cost-efficient glass production.

These results are valuable for the production of optical, electronic, and decorative glasses.

Future Directions: Research on Pb-free and environmentally safe low-temperature glass technologies.

Optimization of local raw materials through advanced mineralogical analysis and quality control.

Further enhancement of energy efficiency through melting process optimization and modernization.

Karakalpakstan's feldspar deposits have K-Na feldspars of high quality. The innovative technological process integrating magnetic separation and flotation resulted in feldspar with 97% purity and minimized Fe_2O_3 to 0.23%. Addition of 20% feldspar to ceramic materials decreased the sintering temperature by 100ºC and increased the mechanical strength. The technology is energy efficient and environmentally sustainable. It is also cost-effective and will facilitate industrial development. Opening a feldspar processing plant in Karakalpakstan would contribute to import substitution, employment growth, and economic development in the region.

APPLICATION OF MACHINE LEARNING ALGORITHMS FOR AUTOMATIC ANALYSIS OF THE KARAKALPAK LANGUAGE

Uteuliev N., Abdalieva G., Djaykov G., Kalmuratov B., Rzambetova S.
Nukus State Technical University
utewlievn@mail.ru

Summary: *This article discusses the development of a grammatical model for the Karakalpak language using artificial intelligence. The model includes morphological and syntactic analyses and serves as a foundation for language technologies. This approach plays a significant role in the development of the language.*

Key words: *Karakalpak language, machine learning, natural language processing, computational linguistics, automatic language analysis.*

In the era of modern technological advancement, language technologies are rapidly developing. Machine learning algorithms hold great significance in the field of language analysis and are widely used for studying various languages. This article discusses the application of machine learning algorithms for automatic analysis of the Karakalpak language.

Machine learning is a branch of artificial intelligence that enables computers to learn from experience without explicit programming. Machine learning (ML) is a discipline of artificial intelligence (AI) that provides machines with the ability to automatically learn from data and past experiences while identifying patterns to make predictions with minimal human intervention. Machine learning methods enable computers to operate autonomously without explicit programming. ML applications are fed with new data, and they can independently learn, grow, develop, and adapt. Machine learning derives insightful information from large volumes of data by leveraging algorithms to identify patterns and learn in an iterative process. ML algorithms use computation methods to learn directly from data instead of relying on any predetermined equation that may serve as a model.

Automatic language analysis refers to the process of investigating various linguistic aspects (morphology, syntax, semantics) using computers. An algorithm is a sequence of operations performed to solve a specific problem.[1]

The primary aim of this research is to develop methods for the automatic analysis of the Karakalpak language using machine learning algorithms and evaluate their effectiveness.

Relevance of the Study:

1. Automatic grammatical analysis of the Karakalpak language.
2. Assisting in the development of a language corpus.
3. Enhancing machine translation systems.
4. Automating the processes of language learning and teaching.
5. Automatically classifying and analyzing texts in the Karakalpak language.

Natural Language Toolkit is a leading platform for building Python programs to work with human language data. It provides easy-to-use interfaces to over 50 corpora and lexical resources such as WordNet, along with a suite of text processing libraries for classification, tokenization, stemming, tagging, parsing, and semantic reasoning, wrappers for industrial-strength NLP libraries, and an active discussion forum.[4] Thanks to a hands-on guide introducing programming fundamentals alongside topics in computational linguistics, plus comprehensive API documentation, NLTK is suitable for linguists, engineers, students, educators, researchers, and industry users alike. NLTK is available for Windows, Mac OS X, and Linux. Best of all, NLTK is a free, open source, community-driven project.

NLTK has been called “a wonderful tool for teaching, and working in, computational linguistics using Python,” and “an amazing library to play with natural language.” Natural Language Processing with Python provides a practical introduction to programming for language processing. Written by the creators of NLTK, it guides the reader through the fundamentals of writing Python

programs, working with corpora, categorizing text, analyzing linguistic structure, and more. The online version of the book has been been updated for Python 3 and NLTK 3.

Python, with its extensive libraries and user-friendly syntax, is widely used in machine learning. For analyzing the Karakalpak language, the following Python libraries and algorithms are utilized:

1. NLTK (Natural Language Toolkit): Provides tools for processing text, including tokenization, morphological analysis, and syntactic analysis.[2][3]

```
import nltk
nltk.download('punkt')
from nltk.tokenize import word_tokenize
text = "Men qaraqalpaq tilin úyrenemen."
tokens = word_tokenize(text)
print(tokens)
```

2. Scikit-learn: Supports classification, regression, and clustering algorithms, which can be used for text classification in the Karakalpak language.

```
from sklearn.feature_extraction.text import CountVectorizer
from sklearn.naive_bayes import MultinomialNB
texts = ["Bul jaqsı kitap", "Hawa rayı jaqsı", "Kitap oqıw paydalı"]
categories = ["kitap", "hawa rayı", "kitap"]
vectorizer = CountVectorizer()
X = vectorizer.fit_transform(texts)
clf = MultinomialNB()
clf.fit(X, categories)
new_text = ["Búgin kún ıssı"]
X_new = vectorizer.transform(new_text)
predicted = clf.predict(X_new)
print(predicted)
```

3. Gensim: Useful for semantic analysis and building word vectors.

```
from gensim.models import Word2Vec
sentences = [["men", "mektepke", "baraman"], ["ol", "kitap", "oqıydı"]]
model = Word2Vec(sentences, min_count=1)
similarity = model.wv.similarity('mektepke', 'kitap')
print(f"'mektepke' and 'kitap' similarity: {similarity}")
```

Key challenges include: Limited resources for the Karakalpak language, including annotated corpora; Morphological complexity due to the agglutinative nature of the language; Lack of standardized linguistic resources.

Proposed Solutions:

1. Developing a comprehensive language corpus.
2. Creating morphological analyzers tailored for Karakalpak.
3. Standardizing linguistic resources, such as dictionaries and grammatical rule sets.
4. Adapting models created for related Turkic languages.
5. Leveraging transfer learning to utilize pre-trained models for the Karakalpak language.

The application of machine learning algorithms for automatic analysis of the Karakalpak language holds significant potential. These methods can play a vital role in researching, preserving, and developing the language. However, much work remains to be done, including creating quality resources, adapting algorithms, and accounting for linguistic nuances. Advancing automatic analysis

technologies will facilitate learning, preserve the Karakalpak language, and promote its global recognition. Innovations in this field will help maintain the language's relevance in the digital age.

INTEGRATION OF SOLAR ENERGY AND HYDRAULIC STORAGE IN IRRIGATION SYSTEMS FOR SUSTAINABLE AGRICULTURE

Jurayev S.R.
Tashkent State Technical University

Summary: *The article explores ways to improve the energy efficiency of drip irrigation systems for agricultural crops through the use of solar energy and hydraulic energy storage. The study focuses on the arid climatic conditions of Uzbekistan, where more than 92% of water resources are used for irrigation, and pumping stations consume about 12–13% of the country's total electricity. A photo irrigation system powered by photovoltaic (PV) panels is proposed, in which solar energy drives pumping units that lift water from artesian wells into storage reservoirs. During peak solar hours, the pumps operate to accumulate water, allowing irrigation to be performed in the evening and nighttime, thereby reducing water loss due to evaporation. Calculations for tomato irrigation on a 20-hectare area show that the required pump power is 20.6 kW, with a daily energy demand of 157 kWh. The cost of electricity generated by PV systems is 15–30% lower than that of energy supplied from thermal power plants. Moreover, the use of hydraulic storage instead of lithium-ion batteries reduces energy storage costs more than tenfold. The results of the techno-economic analysis confirm the efficiency and environmental benefits of the proposed system, which provides a sustainable approach to water and energy supply for agricultural applications.*

Key words: *solar energy, drip irrigation, hydraulic energy storage, photovoltaic system, pumping station, energy efficiency, water conservation, sustainable development, agriculture.*

At present, more than one-third of the world's population is engaged in agriculture; for them, it is the main source of income and plays a crucial role in the economic development of many countries by providing food, raw materials, products, and employment opportunities [1]. In this regard, investments in agriculture are increasing year by year, contributing to poverty reduction in developing countries [2], addressing key global issues such as achieving food security and improving nutrition [3], and promoting economic growth and development [4,5].

The Republic of Uzbekistan is an arid country with low precipitation, low humidity, and a high level of evaporation; as a result, more than 92% of its water resources are used for irrigation of agricultural crops sown on an area of 4.28 million hectares [6]. Therefore, considering the annual increase in water demand due to the development of the agricultural sector and population growth, ensuring sufficient water resources is one of the country's main challenges.

The irrigated lands of the country are energy-intensive, since about 51% of them receive water through pumping stations, consuming 12–13% of the total electricity generated in the Republic annually [6]. Almost all pumping stations are electrified, and only a small part of the installations are powered by diesel generators. Energy expenditure constitutes the largest share of the operating costs of pumping stations. Therefore, for farmers of the Republic, issues of water and energy conservation, as well as the use of alternative and cheaper energy sources for powering pumping installations, are extremely important.

At present, one of the rational solutions for saving water resources and reducing energy costs in irrigating small agricultural plots is drip irrigation powered by solar energy [7–10]. The authors of [7] argue that using solar energy for drip irrigation of small areas significantly reduces the cost of production. Recently, this direction has become so promising that the term "photo irrigation" has emerged - meaning irrigation using solar energy [8]. The potential of photo irrigation was studied for irrigating olive trees over an area of 10 hectares in southeastern Spain, and the results showed that 161 m³/day of water was required with a PVS of 6 kW capacity [8].

The authors of [9] presented the results of irrigation studies for various crops in five geographic locations around the world: Spain, Saudi Arabia, Mexico, Lebanon, and Jordan. For this

purpose, different power supply options for pumping systems were considered—diesel generators, the electrical grid, and photovoltaic systems (PVSs). The results demonstrated that, in all geographic locations, the use of PVSs resulted in costs 15–30 times lower than those of diesel generators, and 2.2–2.4 times lower than those associated with grid-connected systems.

It should be noted that most researchers in photo irrigation identify the main stages of such studies as follows [7–10]:

1. Determination of the annual amount of water required, distributed by months and days, for the selected irrigated area.

2. Selection of the pumping unit and determination of its parameters along with the pipeline system.

3. Determination of the parameters of the photovoltaic system that meet the requirements of the pumping unit.

The issue of solar energy storage is considered essential due to its practicality. For this purpose, electrochemical or thermal storage is usually proposed, although it is noted that this significantly increases the system's cost [8, 11, 12]. In [12], it is mentioned that to reduce the cost of energy systems, alternative methods such as hydraulic water storage should be considered.

In the Republic of Uzbekistan, drip irrigation is a rapidly developing and promising area. Currently, its energy supply is mainly provided by the centralized electrical grid or fuel-based generators. Under these conditions, studying the use of hydraulic storage of solar energy to improve its efficiency - based on determining optimal irrigation timing, storage volumes, and pumping unit parameters - is, in our view, both interesting and important, though unfortunately, insufficiently explored.

Let us consider the possibilities of hydraulic water and energy storage in drip irrigation systems, for example, for tomato crops over an area of 20 hectares. Here, solar energy is used to power a pumping unit installed in an artesian well that serves as the water source for the area (Figure 1).

Energy from the PVS is transmitted through an inverter to the pumping system (PS), which pumps water from the source into a storage reservoir. Water from the reservoir is then supplied to the drip irrigation system through filters and a fertilizer dosing unit and further distributed to the drip lines. The entire process - starting and stopping the units, controlling water flow, and managing electrical energy - is automated via a control panel under specialized software (e.g., HOMER).

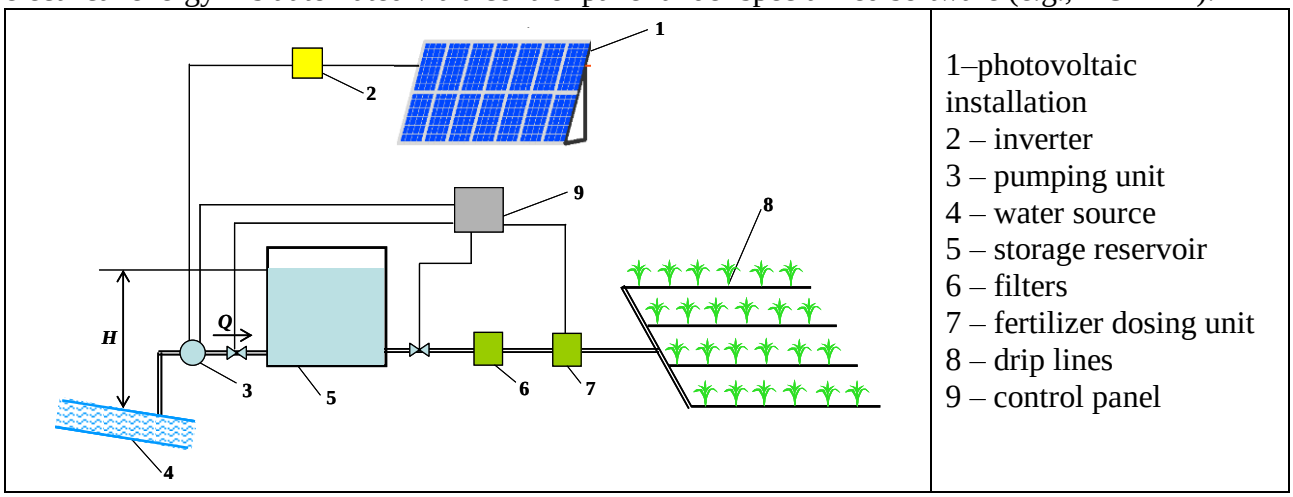

Figure 1. Schematic of a drip irrigation system using solar energy.

Determination of the energy characteristics of this complex is based on solar radiation activity and the irrigation schedule of crops over a 24-hour period, typical for the given area. For many crops in Uzbekistan, irrigation is recommended during evening and nighttime hours to minimize evaporation and transpiration losses (including for tomatoes) [13].

Thus, during peak solar radiation hours, irrigation is not performed; instead, solar energy is used to power the PU, which stores the required water volume in the reservoir.

According to the irrigation scheme providing sequential watering of the designated plots, the water volume required for a single irrigation can be determined as:

$$V_{ir} = m \cdot \omega / n \quad (1)$$

where m – irrigation rate, m³/ha; ω – area size, ha; n – number of plots. The flow rate of water supplied for irrigation is determined as follows:

$$Q_{ir} = V_{ir}/3600 \cdot t_{ir} \quad (2)$$

where t_{ir} is the duration of irrigation (hours).

The capacity of the pumping unit, which must ensure the supply of V_{ir}, can be determined by the following relationship:

$$Q_{PVS} = V_{ir}/3600 \cdot t_{pu} \quad (3)$$

t_{ps} is the duration of the pumping unit's operation during the day (determined based on the number of peak sun-hours during the day and the pump's operating mode).

The daily electrical energy generated by the PVS can be determined by the formula:

$$E_{PVS} = \int_{t_1}^{t_2} N_{PVS}(t)dt \quad (4)$$

The amount of E_{PVS} must be sufficient to supply the water volume V_{ir} from the source to the reservoir, which is determined as follows:

$$E_{PVS} = V_{ir} \cdot H/367 \cdot \eta, kW \cdot h \quad (5)$$

where H and η are the head and efficiency of the pumping unit.

The total energy generated by the PV system, considering losses in the inverter, which are equal to 15 – 20 % of E_{PV}, is calculated by the following relationship [14]:

$$E_{PVS}^{ir} = 1{,}2 \cdot E_{PVS}, kW \cdot h \quad (6)$$

Based on E_{PVS} and t_{ps}, the energy parameters of the PVS are determined, and its main components are selected [219].

To calculate the power of the pumping unit, we use the following expression:

$$N_{ps} = 9{,}81 \cdot K_з \cdot Q_{ps} \cdot H/\eta, kW \quad (7)$$

where $K_з = 1{,}15 \div 1{,}2$ is the power reserve coefficient.

The results of calculating the water flow rate and pumping unit power by irrigation periods throughout the year, calculated using the formulas above, can be presented in the diagram shown in Figure 2. Based on this diagram, the annual values of water flow rate and electricity required for the full water supply of the irrigated area can be determined.

$$V_{year} = \sum_{i=1}^{n} Q_i \cdot t_i; \qquad E_{year} = \sum_{i=1}^{n} N_i \cdot t_i \quad (8)$$

where n is the number of irrigation periods;

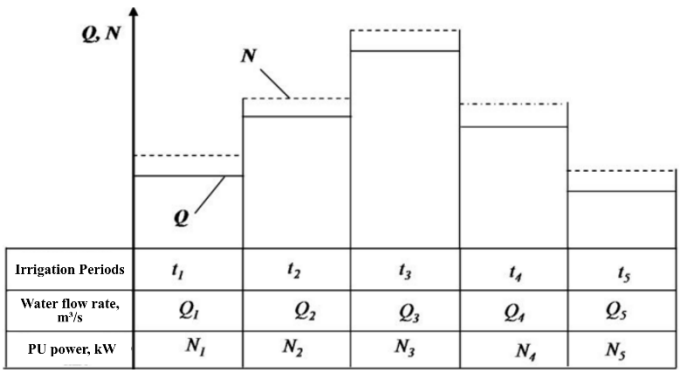

Figure 2. Water Flow Rate in the Irrigation System and Pumping Unit Power by Irrigation Periods throughout the Year

The values of the water flow rate supplied for irrigation, as well as the power of the PVS and PS, can be illustrated using the diagram in Figure 3.

The diagram shows that tomato irrigation is carried out from 17^{00} to 9^{00} for 16 hours, and during the daytime from 9^{00} to 17^{00}, the necessary volume of water will be accumulated in the reservoir by the PS, which is powered by the PVS and will operate at the maximum possible power.

The water flow rate required for irrigation is determined based on the type of agricultural crop, soil properties, climatic, and hydrogeological conditions corresponding to the given irrigated area. For example, for tomatoes in the southern zones of the Republic, the annual irrigation norm averages 5500 m^3/ha with 600 to 700 m^3/ha spent on each irrigation. The number of irrigations is 9, with the irrigation time being from May 1 to October 10 [15]. The duration of irrigation, depending on its scheme, is 10 to 30 hours.

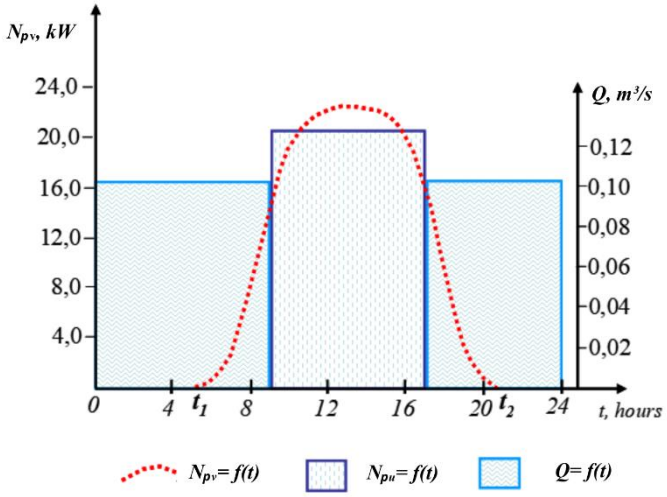

Figure 3. Diagram of Water Flow Rate for Drip System and Unit Power

We present the results of calculating the flow rates and volumes of water, as well as the required amount of electricity for powering the pumping unit, with a head $H = 12$ meters and an efficiency η = 0,7 a number of plots 5, and an irrigation duration 16 hours.

1. Volume of water required for a single irrigation: $V_{ir}=m\cdot\omega/n=700\cdot20/5=2800\ м^3$.
2. Water flow rate supplied for irrigation: $Q_{ir}=V_{ir}/(3600\cdot t_{ir})=2800/3600\cdot16=0{,}0486\ м^3/с$
3. Capacity of the pumping unit, which must ensure the supply of V_{ir}:

$Q_{ps} = V_{ir}/3600\cdot t_{ps} = 2800/(3600\cdot7{,}6) = 0{,}102\ м^3/с$

where $t_{ps} = T_{peak}$ is the number of peak sun-hours during the day, T_{peak} = 7,6 h. [15].

4. Pumping unit power:

$N_{ps}=9{,}81\cdot K_з\cdot Q_{ps}\cdot H/\eta=9{,}81\cdot1{,}2\cdot0{,}102\cdot12{,}0/0{,}7=20{,}58\ kW$

5. Required amount of electricity:

$E_{PVS}=V_{ir}\cdot H/367\cdot\eta=2800\cdot12,0/367\cdot0,7=130,79\ kW\cdot h$

6. Total energy generated by the PVS system: PVS:$E_{PVS}^{ir}=1,2\cdot E_{PV}=1,2\cdot130,79=157\ kW\cdot h$

7. Annual amount of generated electricity:

$$E_{PVS}^{year}=V_{ir}^{year}\cdot \mathrm{H}/367\cdot\eta=110000\cdot12,0/367\cdot0,7=5138,19kW\cdot h$$

where $V_{ir}^{year}=M\cdot\omega=5500\cdot20=110000\ m^3$, M is the irrigation norm, m^3/ha

8. Cost of electricity from the PV system at tariffs of 0,1 \$ (kWh·hour)$^{-1}$ [16]:

$$C=5138,19\cdot0,1=513,82\ \$$$

9. Cost of electricity from thermal power plants at tariffs of 0,13 \$ (kWh·hour)$^{-1}$ [16]:

$$C=5138,19\cdot0,13=668\ \$$$

10. Cost of electricity storage by hydraulic method at specific costs of 0,01 \$ (kWh·hour)$^{-1}$ [17]:

$$A=5138,19\cdot0,012=61,65\ \$$$

11. Cost of electricity storage with lithium-ion batteries at specific costs of 0,187 \$ (kWh·hour)$^{-1}$ [18]:

$$A=5138,19\cdot0,187=960,84\ \$$$

12. Resulting effect:

a) In terms of electricity costs: *154,18 $.*

b) In terms of electricity storage costs*: 899,19 $.*

The main advantages of the proposed scheme and operating mode for the drip irrigation system are as follows:

- Energy supply to the pumping unit using PV energy significantly reduces energy costs compared to the option from thermal power plants (TPP), as the specific cost of PV energy is currently less than 0,1 \$ (kWh·hour)$^{-1}$, and TPP energy is 0,1÷0,17 \$(kWh·hour)$^{-1}$ [16]. According to the Fraunhofer Institute for Solar Energy Systems, the specific cost of energy from combined cycle gas turbine plants is 7,78÷9,96 euro cents (kWh·hour)$^{-1}$, and from gas plants is 11,0÷21,94 euro cent (kWh·hour)$^{-1}$ [18]. Moreover, the cost of solar energy decreases year after year, while the cost of TPP-generated energy increases.

- The use of the PV system only during peak solar activity hours increases the utilization of solar energy and reduces the pumping unit's operating time, thereby lowering its life cycle costs;

- The proposed solar energy use and storage system favorably differs from other storage systems in parameters such as specific power cost, speed of activation, and large storage volumes [17].

The results of the techno-economic calculations showed that using solar energy to power the pumping unit of the tomato drip irrigation system on a 20-hectare area, with PV energy costing 0,1\$ (kWh·hour)$^{-1}$ and energy from thermal power plants costing 0,13 \$(kWh·hour)$^{-1}$ allows for an annual savings of 154.18\$ (excluding the cost of power transmission lines). The effect obtained from implementing the proposed scheme increases several times if it is used in areas without power supply to replace diesel generators.

The specific cost of energy storage in the proposed system is 0,012/0,17 \$ (kWh·hour)$^{-1}$ [17], while in storage units with lithium-ion batteries, this indicator exceeds 0.23\$, and according to Bloomberg New Energy Finance, it is no lower than 0,187 \$ (kWh·hour)$^{-1}$ [19], the resulting effect on storage costs is 899,19 \$, Furthermore, this hydraulic storage system allows for the accumulation of large volumes of energy in conjunction with irrigation pumping stations [17].

All the above indicators convincingly show that in water supply and irrigation systems, the use of solar energy to power pumping units, with a scientifically sound selection of generation and storage volumes, has undeniable advantages.

Tadqiqot O‘zbekistonning qurg‘oqchil sharoitlariga asoslangan bo‘lib, bu yerda suv resurslarining 92 % dan ortig‘i sug‘orishga sarflanadi va nasos stansiyalari mamlakatdagi umumiy elektr energiyasining 12–13 % ini iste’mol qiladi. Quyosh panellari yordamida nasos agregatlarini quvvatlantiruvchi “fotoirrigatsiya” tizimi taklif etilgan. Quyosh faoliyati eng yuqori bo‘lgan paytda nasos suvni rezervuarga to‘playdi, poliv esa kechki va tungi soatlarda amalga oshiriladi, bu esa suvning bug‘lanishini kamaytiradi. 20 ga maydonda pomidor sug‘orish misolida hisob-kitoblar bajarilib, nasos quvvati 20,6 kVt, zarur energiya esa 157 kVt·soat ekanligi aniqlangan. Quyosh elektr energiyasining tannarxi issiqlik elektr stansiyalariga nisbatan 15–30 % arzonroq. Litiy-ion batareyalarga nisbatan gidroakkumulatsiya tizimi energiya saqlash xarajatlarini 10 martadan ko‘proq kamaytiradi. Hisob-kitob natijalari taklif etilgan tizimning iqtisodiy va ekologik samaradorligini tasdiqlaydi.*

Резюме: *В статье рассматриваются вопросы повышения энергоэффективности систем капельного орошения сельскохозяйственных культур путем использования солнечной энергии и гидравлического аккумулирования воды. Исследование выполнено для условий аридного климата Узбекистана, где до 92 % водных ресурсов расходуется на орошение, а насосные станции потребляют около 12–13 % всей электроэнергии страны. Предложена схема фотоэлектрического орошения (photoirrigation), при которой энергия солнечных*

панелей используется для питания насосных установок, подающих воду из артезианских источников в накопительные резервуары. В часы максимальной солнечной активности насосы работают на накопление воды, что позволяет выполнять полив в вечернее и ночное время, снижая потери влаги от испарения. Проведены расчеты для орошения томатов на площади 20 га, показавшие, что мощность насосной установки составляет 20,6 кВт, а требуемая энергия - 157 кВт·ч в сутки. Стоимость электроэнергии от фотоэлектрической установки оказалась ниже на 15–30 % по сравнению с энергией от тепловых электростанций. Применение гидроаккумулирования вместо литий-ионных батарей снижает затраты на накопление энергии более чем в 10 раз. Результаты технико-экономических расчетов подтверждают эффективность и экологическую целесообразность предложенной системы, обеспечивающей устойчивое водо- и энергоснабжение сельского хозяйства.

DEVELOPMENT OF A LOCAL FELDSPAR PROCESSING TECHNOLOGY IN KARAKALPAKSTAN, UZBEKISTAN

Aymuratova T.T., Kudyarova K.K.
Karakalpak State University named after Berdakh

Summary: *This study focuses on the development of an energy-efficient and water-saving processing technology for local feldspar (K–Na–Al-silicate) raw materials in the Karakalpakstan region of Uzbekistan. The chemical composition, mineralogical characteristics, and beneficiation processes of locally available feldspar ores were investigated. Modern methods such as dry magnetic separation, froth flotation, and acid leaching were optimized to obtain high-grade feldspar concentrates. The results were compared with similar international studies indexed in Scopus and Web of Science. The developed process produced a feldspar concentrate containing 71.0% SiO_2, 19.1% Al_2O_3, and only 0.18% Fe_2O_3, which meets industrial requirements for glass and ceramic production.*

Key words: *feldspar, beneficiation, Karakalpakstan, magnetic separation, flotation, ceramics, energy efficiency*

1. Introduction

Feldspar minerals represent one of the most abundant aluminosilicate groups in the Earth's crust, essential for the production of ceramics, glass, and enamel.[1] They are mainly composed of orthoclase ($KAlSi_3O_8$), albite ($NaAlSi_3O_8$), and anorthite ($CaAl_2Si_2O_8$).

In Uzbekistan, particularly in the **Karakalpakstan** region, granitic and pegmatitic deposits containing Na–K feldspar are widespread but remain underutilized. The lack of local beneficiation plants leads to dependence on imported feldspar from Russia and China. Developing a domestic feldspar processing technology could significantly strengthen Uzbekistan's industrial independence.

Recent global research has focused on optimizing feldspar beneficiation using **magnetic separation, flotation, and acid leaching** to achieve high purity and low Fe_2O_3 content.[2] However, adaptation of these methods to arid regions such as Karakalpakstan—where water resources are limited—requires process modifications.

The aim of this study is to design and validate a **dry, energy-efficient feldspar processing technology** suited to Karakalpakstan's geological and environmental conditions.

2. Materials and Methods

2.1. Raw material sampling

Samples were collected from granitic outcrops in the **Beruniy–Qo'ng'irot geological zone** of Karakalpakstan. Approximately 5 kg of representative feldspar-bearing rock was obtained for laboratory analysis.

2.2. Chemical and mineralogical analysis

X-ray fluorescence (XRF) and X-ray diffraction (XRD) analyses were used to determine the chemical and mineral phase composition.

Component	Content (%)
SiO_2	67.4
Al_2O_3	18.5
K_2O	4.8
Na_2O	4.2
Fe_2O_3	0.6
CaO	1.1

These results are comparable with feldspar compositions reported in similar granitic deposits.[5]

2.3. Beneficiation process

1. **Crushing and grinding:** The ore was crushed in a jaw crusher and ground in a ball mill to below 100 μm.
2. **Magnetic separation:** Dry magnetic separation (0.8 T) was performed to remove Fe-bearing minerals (Baila et al., 2023).
3. **Flotation:** A mixture of oleic acid and dodecylamine reagents was applied to separate feldspar from quartz and mica (Mohanty et al., 2024).
4. **Acid leaching:** To further reduce iron oxide impurities, samples were treated with 5% HCl solution at 60 °C for 30 min.
5. **Drying and sieving:** Final products were dried at 110 °C and screened into specific size fractions.

3. Results

After beneficiation, the feldspar concentrate showed the following chemical composition:

Parameter	Raw ore	Concentrate
SiO_2 (%)	67.4	71.0
Al_2O_3 (%)	18.5	19.1
$K_2O + Na_2O$ (%)	9.0	9.7
Fe_2O_3 (%)	0.6	0.18
Yield (%)	—	83.2

Magnetic separation reduced Fe_2O_3 by approximately 70%, while flotation effectively removed quartz and mica impurities. These results are consistent with findings by[7], who achieved similar purity levels in weathered granitic feldspar.

The final product meets the chemical requirements for use in **glass, porcelain, and ceramic production**, as per international standards.[1]

4. Discussion

The results demonstrate that Karakalpakstan feldspar deposits are mineralogically similar to those in Khiva.[4] Implementing dry magnetic separation significantly reduces water usage, which is crucial for arid environments.

Compared with previous methods[6], the proposed process shows improved energy efficiency and reduced reagent consumption. Acid leaching, as highlighted by, proved to be the most effective step in minimizing Fe_2O_3 to below 0.2%, ensuring suitability for high-quality glass manufacturing.

Thus, this optimized combination of **magnetic–flotation–acid purification** is both technically and environmentally suitable for the Karakalpakstan context.

5. Conclusion

1. Local feldspar deposits in Karakalpakstan contain high-quality Na–K–feldspar suitable for industrial applications.
2. The proposed beneficiation process—combining dry magnetic separation, flotation, and acid leaching—achieved an Fe_2O_3 content below 0.2% with 83% yield.
3. The process is water-efficient and energy-saving, aligning with the environmental constraints of the region.
4. The developed technology can substitute feldspar imports and promote the growth of Uzbekistan’s ceramic and glass industries.

Были изучены химический состав, минералогические характеристики и процессы обогащения местных полевошпатовых руд. Для получения высококачественных полевошпатовых концентратов были оптимизированы современные методы, такие как сухая магнитная сепарация, пенная флотация и кислотное выщелачивание. Результаты были сопоставлены с аналогичными международными исследованиями, индексируемыми в Scopus и Web of Science. Разработанная технология позволила получить полевошпатовый концентрат, содержащий 71,0% SiO_2, 19,1% Al_2O_3 и всего 0,18% Fe_2O_3, что соответствует промышленным требованиям для производства стекла и керамики.*

QUALITATIVE ANALYSIS METHODS FOR DETERMINISTIC FARM MODELS WITH LIMITED USE OF WATER RESOURCES

Uteuliev N.U[1]., Arzimbetov T.Z[1]., Jarilkanov B.P[2].
[1]*Nukus State Technical University,*
[2]*Tashkent University of Information Technologies named after Muhammad al-Khwarizmi*

Summary: *In this work, methods for the qualitative analysis of deterministic models of the activities of farms with limited water resources are studied.*

Key words: *Keywords: model, style, resource, direct problem, dual problem, optimal, maximum, minimum, solution.*

Currently, agriculture is one of the most important branches of the national economy of our republic. The intensification of production in this industry, with limited resources allocated for this purpose, is of great importance in the context of the transition to new forms and methods of management. Therefore, the purpose of this work is to develop and analyze deterministic models for farms with limited use of water resources. As well as establishing the relationship between duality and optimality conditions for direct and dual tasks of allocating limited water resources. The study and construction of mathematical models of this class is especially relevant for such an important area of human activity as agricultural production.

So, here is a deterministic version of the problem statement:

$$F = \sum_{j \in A} \sum_{k=1}^{K} P_{kj} x_{kj} a_{kj} \to \max , \tag{1}$$

$$\sum_{j \in A} x_{kj} \le S_k , \quad \left(k = \overline{1, K}\right), \tag{2}$$

(land resources)

$$\sum_{j \in A} \sum_{k=1}^{K} b_{skj} x_{kj} \le b_s , \left(s = \overline{1, m}\right), \tag{3}$$

(material resources)

$$\sum_{j \in A} \sum_{k=1}^{K} a_{\omega jk} x_{kj} \le b_\omega , \quad \left(\omega \in W\right), \tag{4}$$

(mineral resources)

$$\sum_{k=1}^{K} a_{kj} x_{kj} \ge \alpha_j , \quad \left(j \in A\right), \tag{5}$$

(minimum volume of crop production)

$$\sum_{j \in A} \sum_{k=1}^{K} \hat{b}_{kj} x_{kj} \le b . \tag{6}$$

(water resources)

$$x_{kj} \geq 0 \quad \left(j \in A = A_1 \cup A_2, k = \overline{1,K}\right) \tag{7}$$

Here:

A_1 - there are many branches of grain production in agriculture;

A_2 - there are many branches of cotton production in agriculture;

P_{kj} - the profit received from the production of a unit of the *j*-th crop on the *k*-th plot of land in a farm;

x_{kj} - the area of the *k*-th plot for the cultivation of the *j*-th crop on a farm;

S_k - the area of the *k*-th plot of land in a farm;

b_{skj} - the cost rate of the *s*-th type of resource per unit area of the *k*-th plot of land for cultivating the *j*-th crop on a farm;

b_s - the volume of the *s*-th resource in the farm;

S - the number of the type of resource in the farm;

m - the amount of production resources in a farm;

b_ω - volume ω -th mineral resource in the farm;

α_j - volume of mandatory deliveries j - the use of crop production in agriculture;

a_{kj} - yield indicator j -th culture on k -th plot of land on a farm;

b_{kj} - the rate of water consumption per unit area k -th plot of land for cultivation j -the use of crop production in a farm;

b - the volume of water resources of the region in agriculture;

$a_{\omega jk}$ - the rate of application of mineral fertilizers ω -th type on the k -th plot of land per unit area of the crop of the j -th type in the farm;

W - the amount of all types of mineral fertilizers in the farm.

This means that the direct task is to determine the maximum profit that meets the restrictions on the use of land resources, material resources, mineral fertilizers and crop production, as well as on the use of water resources.

Now let's consider a dual problem, to (1)-(7) :

$$\Phi(y_k, z_s, u_\omega, v_j) = \sum_{k=1}^{K}(s_k, y_k) + \sum_{s=1}^{n}(b_s, z_s) + \sum_{\omega \in W}(b_\omega, u_\omega) - \sum_{j \in A}(\alpha_j, v_j) + bl \to \min, \tag{8}$$

under restrictions

$$y_k + \sum_{s=1}^{n} b_{sjk} z_s + \sum_{\omega \in W} a_{\omega jk} u_\omega - v_j a_{kj} + b_{kj} l \geq P_{kj} a_{kj}, \tag{9}$$

$$y_k \geq 0, \quad z_s \geq 0, \quad u_\omega \geq 0, \qquad v_j \geq 0, \qquad l \geq 0. \quad (10)$$

Here y_k - means the assessment of the k - th land resource;

z_s - assessment of the s - th type of material resource;

u_ω - assessment of the ω - th type of mineral resource;

v_j - assessment of the minimum j -th crop production;

l - assessment of a water resource.

The dual task (8)-(10) is to minimize the difference in the summation of estimates of the land resource, estimates of the material resource, estimates of mineral fertilizers, estimates of the water resource, minus the estimate of the minimum volume of crop production in the farm, which satisfy the restrictions on the use of profit of crop production.

It is interesting to compare the models, in particular, to determine the influence of a water resource on the optimal solution. This can be done based on a qualitative analysis of the model using duality relations.

Problems (1)-(7) and (8)-(10) are interrelated linear programming problems, for which the corresponding first and second duality theorems according to [1] are formulated as follows.

Theorem 1. If one of the problems of the dual pair (1)-(7) and (8)-(10) has a solution, then the other problem is also solvable. Moreover, for any optimal solutions $\{x^*_{ijk}\}$ and $\{y^*_k, \quad z^*_s, \quad u^*_\omega, \quad v^*_j, l^*\}$ problems (1)-(7) and (8)-(10) the equality holds:

$$F\{x^*_{ijk}\} = \sum_{j\in A}\sum_{k=1}^{K} P_{kj} x^*{}_{kj} a_{kj} = \Phi\{y^*_k, \quad z^*_s, \quad u^*_\omega, \quad v^*_j, l^*\} =$$

$$= \sum_{k=1}^{K}\left(s_k, y^*_k\right) + \sum_{s=1}^{n}\left(b_s, z^*_s\right) + \sum_{\omega\in W}\left(b_\omega, u^*_\omega\right) - \sum_{j\in A}\left(\alpha_j, v^*_j\right) + bl^*$$

Theorem 2. In order for an acceptable solution to the $\left(x^*{}_{kj}\right)$ problem (1)-(7) t is necessary and sufficient that there exist values such $\left(y^*_k, z^*_s, u^*_\omega, v_j, l^*\right)$, that

$$y^*_k + \sum_{s=1}^{n} b_{sjk} z^*_s + \sum_{\omega\in W} a_{\omega jk} u^*_\omega - v^*_j a_{kj} +$$
$$+ b_{kj} l^* = P_{kj} a_{kj}, \quad (11)$$

if $x^*_{kj} > 0$.

$$\text{If } y^*_k + \sum_{s=1}^{n} b_{sjk} z^*_s + \sum_{\omega\in W} a_{\omega jk} u^*_\omega - v^*_j a_{kj} +$$
$$+ b_{kj} l^* > P_{kj} a_{kj}, \quad (12)$$

that $x_{kj}^{*} = 0$,

Then the task dual (8)-(10) to task (1)-(7) is to select such sets of resources in order to minimize the difference between the total estimates (land, material, mineral, water) resources and the total estimates (minimum volume of crop production) in the farm, which satisfy constraints (11), i.e. profitable constraints of crop production. Now let's analyze equality (11) and inequality (12), i.e. estimates of the water resource. From (11) , (12) we find l^{*} , which has the form:

$$l^{*} = \frac{\left(P_{kj}a_{kj} + a_{kj}v_{j}^{*}\right)}{b_{kj}} - \frac{\left(y_{k}^{*} + \sum_{s=1}^{m} b_{sjk}z_{s}^{*} + \sum_{\omega \in W} a_{\omega kj}u_{\omega}^{*-}\right)}{b_{kj}} \tag{13}$$

If $x_{kj}^{*} > 0$.

It follows from (12) that if

$$l^{*} > \frac{\left(P_{kj}a_{kj} - \sum_{h \in H} u_{h}^{*} + a_{kj}v_{j}^{*+}\right)}{b_{kj}} - \frac{\left(y_{k}^{*} + \sum_{s=1}^{m} b_{sjk}z_{s}^{*} + \sum_{\omega \in W} a_{\omega kj}u_{\omega}^{*-}\right)}{b_{kj}} \tag{14}$$

that $x_{kj}^{*} = 0$.

The ratio (13) has the following economic meaning: the price of water for crop production in the optimal plan consists of the summation of profits, estimates of the minimum volume of crop production minus the summation of estimates of land resources, the cost of material resources, the cost of mineral fertilizers, divided by the rate of water consumption per unit area of k-th plots of land for cultivation of j-th crop production in agriculture.

In conclusion, it can be noted that the method of qualitative analysis of deterministic farm models will make it possible to use water resources more efficiently for agricultural needs, and will also provide an opportunity, to a certain extent, to correct the negative consequences of their use.

APPLICATION OF SOLAR POWER PLANTS TO REDUCE ENERGY COSTS IN PUMPING STATIONS

Jurayev S.R[1]., Uzaqbaev Q.A[2].
[1]Tashkent State Technical University, Tashkent, Uzbekistan
[2]Karakalpak State University named after Berdakh

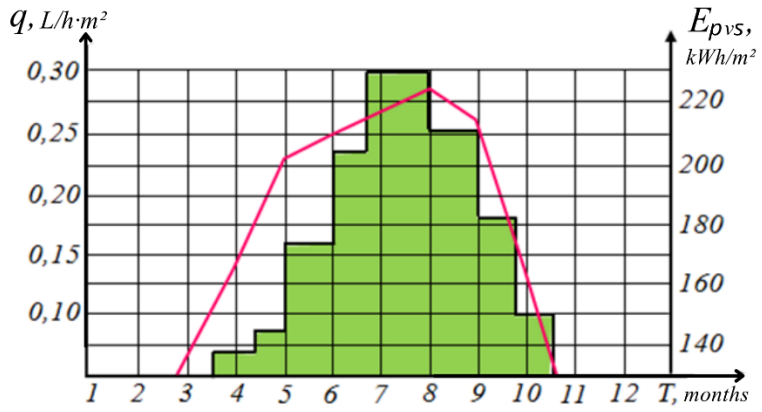
Summary*: The article analyzes methods to reduce energy consumption in pumping stations (PS) powered by photovoltaic stations (PVS). The economic and environmental feasibility of using solar energy in water supply and irrigation systems is substantiated. It is shown that the operation period of irrigation pumping stations coincides with the period of maximum solar activity, making the use of PVS highly efficient. Three options of energy supply are proposed: a combined supply from PVS and thermal power plant (TPP); a hybrid system with partial energy storage from PVS; and a full supply from solar energy. Based on the developed method, the conditions for minimizing energy costs are determined. As an example, the Jizzakh PS-2 with a constant power of 60 MW and a PVS capacity of 100 MW combined with an energy accumulation system (EAS) is analyzed. The results show that the hybrid scheme provides an economic effect of about 33,400 USD per day compared to traditional TPP supply. The study demonstrates that integrating photovoltaic and energy storage systems significantly improves the energy efficiency of pumping stations, reduces operational costs, and decreases carbon dioxide emissions.*

Key words*: photovoltaic station, pumping station, energy consumption, energy storage, thermal power station, energy efficiency, solar energy, hybrid energy supply, economic efficiency, renewable energy sources.*

The feasibility of using PVS for powering PS is determined by several factors, the main ones being:

- lower electricity tariffs compared to those based on fossil fuels;
- well-known environmental advantages;
- the possibility of constructing solar power plants near pumping stations, which significantly reduces energy transmission losses and the cost of power line construction;
- the operational period of irrigation pumping stations largely coincides with the period of solar activity throughout the year, which allows for maximum utilization of solar energy

(Figure 1).



The data presented in the graphs in Figure 1 show that during the vegetation period, the highest levels of solar radiation are observed, providing optimal conditions for the power supply of pumping stations.

When using solar energy for PS power supply, depending on the capacity ratios, the following configurations are possible:

a) combined power supply for the pumping stations based on photovoltaic and thermal power plants;

b) combined power supply based on photovoltaic and thermal power plants with partial storage of solar energy for subsequent use in powering the stations;

c) full coverage of the pumping stations' energy demand using photovoltaic energy.

1 – the amount of solar energy incident on the surface of a photovoltaic panel oriented to the south and installed at an angle of 30° to the horizon, kWh/m² [1].
2 – the amount of water supplied per 1 m² of irrigated land area from March 15 to October 15 in the Kashkadarya region, L/h·m² [2].

Figure 1. Solar radiation energy and water consumption for irrigation of agricultural crops per 1 m² of area under the conditions of the Kashkadarya region.

Possible operation graphs of PS, PVS, and EAS according to the above-mentioned configurations are shown in Figure 2.

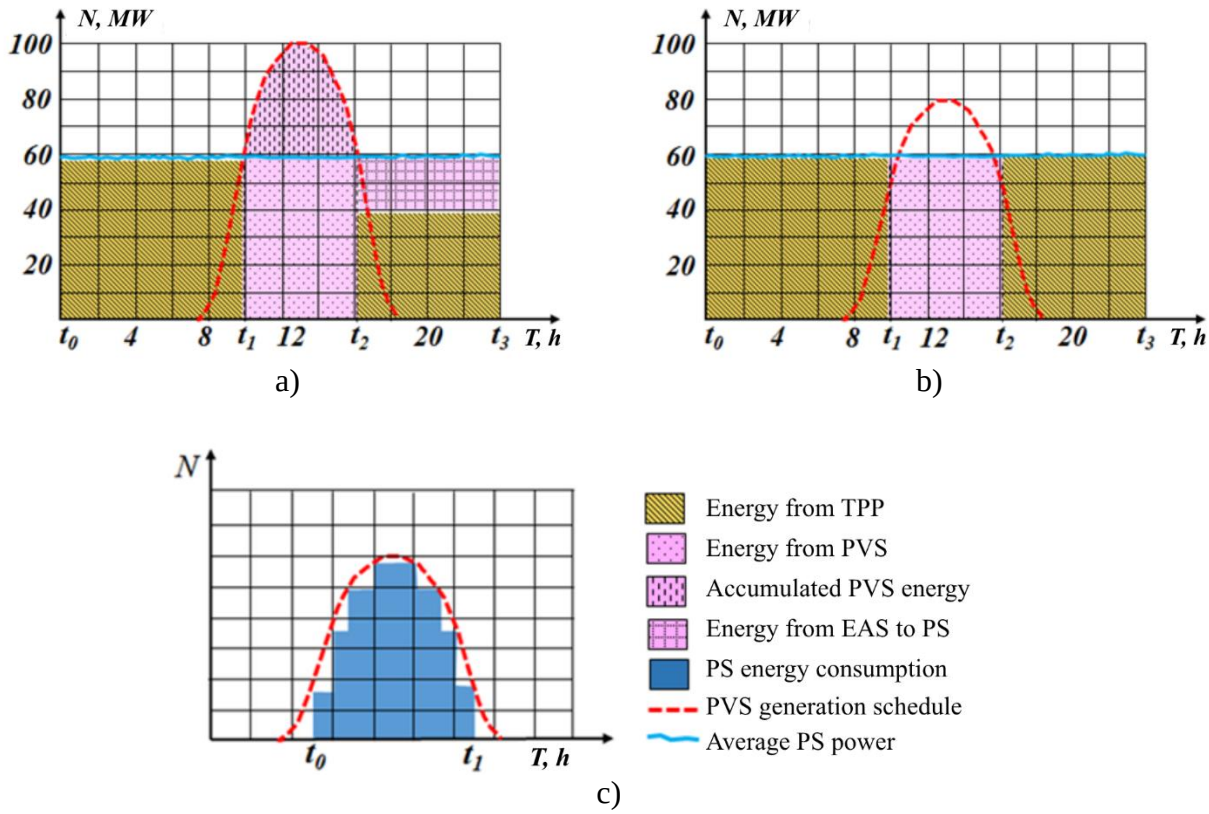


Figure 2. Operating mode graphs of photovoltaic, thermal, and energy storage systems used for powering the pumping stations.

Optimization of the operating modes of the above-mentioned energy complexes is achieved by minimizing energy costs, which is possible under the following conditions:

$$\left.\begin{array}{c} 1.\ Q_{PSmin} \le Q_{PSi} \le Q_{PSmax} \\ 2.\ V_{min} \le \sum_{i=1}^{T} Q_{PSi} t_i \le V_{max} \\ 3.\ 0 \le \gamma_Q \cdot V_{max} \le E_{PS} \end{array}\right\} \quad (1)$$

where, V – the volume of water supplied by the PS to the consumer, γ_Q – the energy consumed by the pumping station to supply 1 m³ of water, kWh/m³.

When the above-mentioned conditions are met, the objective functions for each energy supply option take the following forms:

For the combined power supply of the pumping station based on a PVS and a TPP, with partial accumulation of PVS energy in an EAS:

a) Graphs of the combined use of PVS, TPP, and EAS for supplying a pumping station operating at a constant power throughout the day.

b) Graphs of the combined use of PVS and TPP for supplying a pumping station operating at a constant power throughout the day.

c) Graph of PVS energy generation intended to supply a pumping station operating during daylight hours with variable power.

$$E_{PVS} = \sum_{i=1}^{T_{PVS}} N_{PSi} \cdot t_i \cdot a_{el}^{PVS} + \sum_{i=1}^{T_{TPP}} N_{PSi} \cdot t_i \cdot a_{el}^{TPP} + \sum_{i=1}^{T_{EAS}} N_{PSi} \cdot t_i \cdot a_{el}^{EAS} \rightarrow min \quad (2)$$

where, T_{PVS}, T_{TPP}, T_{EAS} – duration of operation of the PVS, TPP, and EAS during the day, a_{el}^{PVS}, a_{el}^{TPP}, a_{el}^{EAS} – cost of electricity (tariffs) of the PVS, TPP, and EAS for the combined power supply of the PS based on the PVS and TPP;

$$E_{PS} = \sum_{i=1}^{T_{PVS}} N_{PSi} \cdot t_i \cdot a_{el}^{PVS} + \sum_{i=1}^{T_{TPP}} N_{PSi} \cdot t_i \cdot a_{el}^{TPP} \ \rightarrow \ min \quad (3)$$

- for full coverage of the PS energy demand by PVS energy;

$$E_{PS} = \sum_{i=1}^{T_{PVS}} N_{PSi} \cdot t_i \cdot a_{el}^{PVS} \ \rightarrow \ min \quad (4)$$

The determination of daily energy costs using the above methodology can be illustrated by the example of a PS operating according to the schedule shown in Figure 2a.

As an example, the Jizzakh PS-2 with a constant power of 60 MW throughout the day is considered. A PVS with a peak capacity of 100 MW is used to supply power to the pumping station. A portion of the energy generated by the PVS is accumulated and then supplied in the evening to meet the PS demand.

According to the graph of combined use of the PVS, TPP, and EAS, the energy costs can be calculated using the following relationship:

$$E_{PS} = N_{PS}^{TPP}(t_1 - t_0)\, a_{el}^{TPP} + N_{PS}^{PVS}(t_2 - t_1)\, a_{el}^{PVS} + \sum_{i=1}^{t_2 - t_1} N_{PSi}^{EAS1}(t_{2i} - t_{1i\text{-}1})\, a_{el}^{PVS} + N_{PS}^{EAS2}(t_3 - t_2)\, a_{el}^{EAS} + N_{PS}^{TPP}(t_3 - t_2)\, a_{el}^{TPP} \quad (5)$$

where, $\sum_{i=1}^{t_2 - t_1} N_{PSi}^{EAS1}(t_{2i} - t_{1i\text{-}1})$ – the amount of energy used for accumulation,
$N_{PS}^{EAS2}(t_3 - t_2)$ – the amount of energy supplied from the EAS to power the PS;

Distribution of the share of PS power supply among the PVS, TPP, and EAS is as follows: TPP – 920 MWh, PVS – 360 MW·h, accumulated PVS energy – 180 MW·h, energy supplied from accumulation – 160 MW·h.

The consulting company *Lazard* provides data on the LCOE values of TPPs, including the cost of CO_2 emission treatment, as of 2023. For example, the LCOE of TPPs with combined-cycle

gas turbine installations, taking into account CO_2 capture costs, is 0.128 $/kW·h, while for peaking gas turbine plants it ranges from 0.126 to 0.24 $/kWh [3].

According to the *International Renewable Energy Agency (IRENA)*, the average cost of solar energy in 2023 is 0.044 $/kWh [4], while *Total Eren* has proposed a price of

0.04273 $/kWh for the solar power plants being constructed in Uzbekistan [5].

According to data from the *International Hydropower Association* and the *U.S. Department of Energy*, the cost of energy storage is 0.11 $/kWh for pumped hydro storage (PHS) and 0.13 $/kW·h for lithium-ion batteries [6,7,8].

Based on the above data, if we assume that: a_{el}^{PVS} = 0.044 $/kW·h, a_{el}^{TPP} = 0.15 $/kW·h, a_{el}^{EAS} = 0.13 $/kW·h, then the energy costs amount to E_{PS} = 182,560 USD/day.

If the PS is powered entirely by TPP energy, the energy costs amount to E_{PS} = 216,000 USD/day, and comparison with the above results shows that the economic benefit of using the combined power-supply scheme for the PS is at least 33,400 USD/day.

TECHNOLOGY OF DIFFUSION OF EUROPIUM ENTRY ATOM INTO MONOCRYSTALLINE SILICON IN THE GAS PHASE

Abduganiev Y.A.
Tashkent State Technical University

Summary: *A gas-phase diffusion technology for doping monocrystalline silicon with europium impurity atoms has been developed. The proposed method enables the incorporation of europium atoms into the silicon crystal lattice without disturbing its structural integrity. Experimental investigations allowed the determination of the optimal diffusion parameters, ensuring a uniform distribution of the dopant within the near-surface region of silicon. According to the results, the penetration depth of europium atoms into silicon reaches 15–16 μm. Electrical measurements revealed that the concentration of charge carriers formed in the surface layer is 1.8 × 10¹⁸ cm⁻², which confirms the effective electrical activation of europium atoms in the silicon lattice. The developed technology is considered promising for the fabrication of optoelectronic, luminescent, and spintronic devices based on silicon., and spintronic structures, where controlled rare-earth doping is required.*

Key words: *Silicon, europium, diffusion, concentration, diffusion coefficient, temperature.*

Introduction

It has been shown that an intensive molecular bond can form between two impurity atoms of donors in silicon (leading to the formation of nanoclusters). To form such nanoclusters, it is necessary to force the impurity atoms to diffuse through the crystal lattice and ensure that they exist only in inert states. Based on experimental data, the authors determined that the formation of such molecules occurs not during diffusion, but during an additional low-temperature thermal annealing process performed after diffusion in silicon.

The existence of an intensive molecular bond between two donor impurity atoms in silicon (leading to the formation of nanoclusters) has been demonstrated. To form such nanoclusters, it is necessary to induce the diffusion of impurity atoms through the crystal lattice and ensure that they exist only in inert states. Based on experimental data, the authors found that the formation of such molecules occurs not during diffusion, but during an additional low-temperature thermal annealing process carried out in silicon after diffusion [1–3].

Research has shown that the diffusion coefficient of europium impurity atoms in silicon is relatively small [4,5]. By analyzing previous studies, it is possible to determine the diffusion coefficient and its temperature dependence by appropriately selecting the diffusion temperature and duration:

$$D = D_0 \exp(-E_a / kT) \qquad (1)$$

$$D_{Eu} = 2 \cdot 10^{-2} \exp(-2.8 / kT) \qquad (2)$$

here, E_a is the activation energy of diffusion, D_0 is the diffusion coefficient at infinitely high temperature, and k is the Boltzmann constant. According to theoretical calculations, the diffusion coefficient of europium impurity atoms in silicon in the temperature range of T=1100–1350℃ is D_{Eu}= $1.1 \cdot 10^{-12}$–$4.3 \cdot 10^{-11}$ **cm²/s,** respectively (Fig. 1).

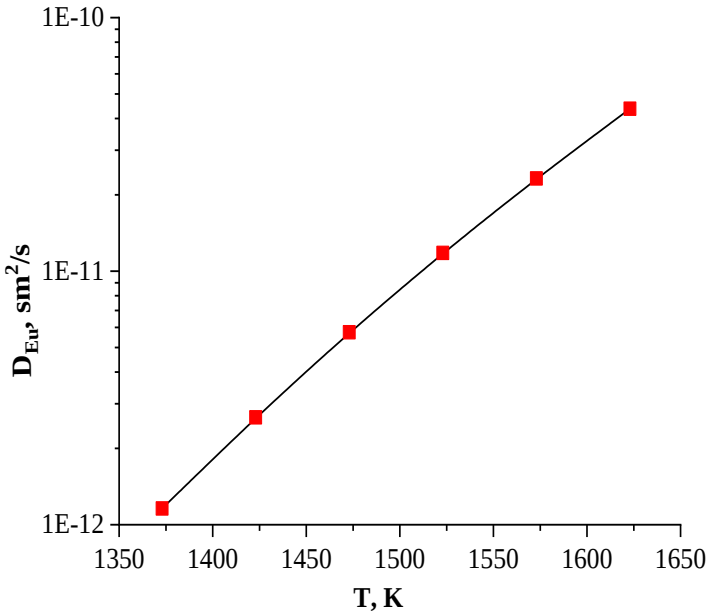

Figure 1. Temperature dependence of the diffusion coefficient for the Si<EuO> sample.

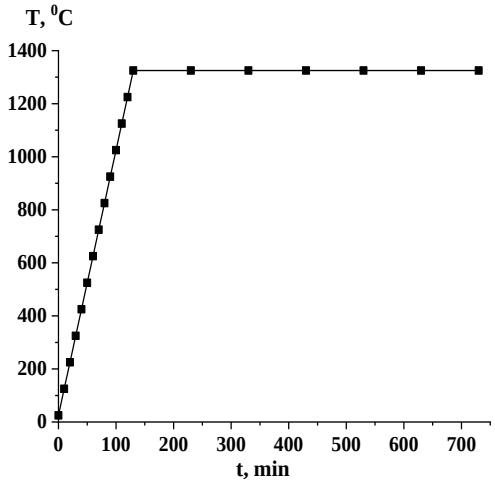

Figure 2. Dependence of temperature variation on diffusion time during the diffusion process of impurity atoms into the silicon sample.

Based on theoretical calculations, impurity atoms were diffused into silicon from the gaseous phase in an MG17–60/300 type vacuum tube electric furnace. The furnace containing the samples was heated from room temperature to **T = 1200–1250 °C** at a rate of **10–15 °C/min** (see Fig. 2). The samples were held at this temperature for **10–15 hours**, after which the quartz ampoules were removed from the furnace and rapidly cooled. To compare the research results with the electrophysical parameters of the initial silicon, the same heat treatment was also applied to the original silicon under identical conditions.

To remove the oxide layer formed on the silicon surface after diffusion, the samples were treated with a hydrofluoric chemical solution and distilled water (HF+H2O2). During this treatment, the surface layer of the samples was etched to a depth of approximately 0.05–0.5 **μm.**

The diffusion of europium impurity atoms in silicon occurs via vacancies, taking place only from one lattice site to another. In this case, the diffusion process proceeds slowly, since the activation energy must be sufficient to break the bonding energy and to create a vacancy.

$$E_a=E_b+E_v \qquad (3)$$

here, E_a is the activation energy, E is the bonding (binding) energy required to break the bond, and E_v is the energy required for vacancy formation.

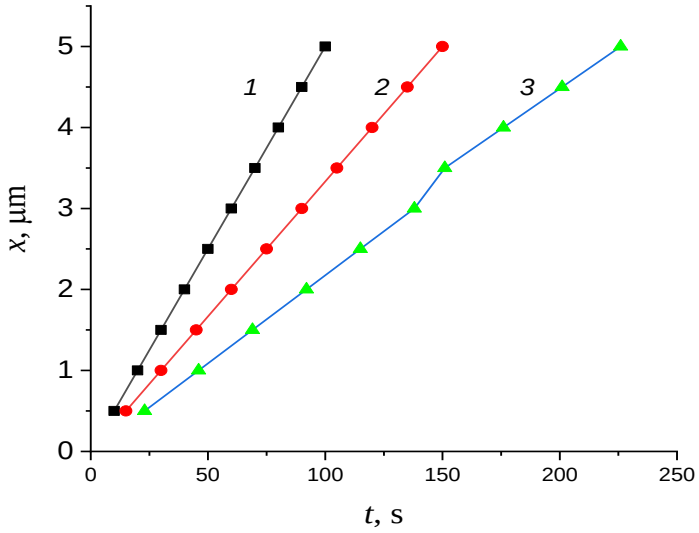

Figure 3. Dependence of the chemical etching of the surface layer of the silicon sample on time.1) 1HF+16HNO₃+8CH₃COOH. 2) 1HF+16HNO₃+16CH₃COOH. 3) 1HF+16HNO₃+24CH₃COOH for chemical solutions.

Experimentally, the impurity atoms in the surface layer of the sample were determined by successive (layer-by-layer) etching in a chemical solution prepared from a mixture of hydrofluoric acid, nitric acid, and acetic acid. In the first stage, to determine the time dependence of the chemical etching of the initial sample (Si<P>–80), chemical solutions with different ratios were prepared:

1) $1HF+16HNO_3+8CH_3COOH$.
2) $1HF+16HNO_3+16CH_3COOH$.
3) $1HF+16HNO_3+24CH_3COOH$.

In this process, acetic acid was used to control the reaction time. The results shown in **Figure 3** were obtained under identical conditions at a temperature of **T =22 °C,** and the experiments were repeated several times. In the first and second mixtures, the chemical etching proceeded linearly, and the etching rates were determined to be. To accurately determine the penetration depth of the impurity atoms, the linear part of the chemical etching reaction was selected based on the data from **Figure 3.**

TECHNOLOGY FOR OBTAINING SAMPLES

To study the ferromagnetic properties of silicon doped with europium impurity atoms, initial monocrystalline silicon samples of grades **KEF-6, KEF-40, and KEF-80** were selected. The diffusion of europium atoms was carried out in evacuated quartz ampoules (vacuum up to **P = 10^{-6} mm Hg)** at temperatures ranging from **T = 1100–1250 °C** for **t = 6÷15 hours** [6–8].

Table 1 shows the electrophysical parameters of the samples measured after diffusion using the **ECOPIA HALL HMS-7000** Van der Pauw measurement system.

Table 1.

Samples	**Type of Conductivity**	Resistivity, ρ, Ω·cm	**Charge Carrier Mobility**, μ, см^2/В·с	Charge Carrier Concentration N, см$^{-3}$
Si<P, Eu>-80	*p*	$1.8\cdot10^{-2}$	191	$1{,}8\cdot10^{18}$
Si<P,Eu>-40	*p*	$1.36\cdot10^{-2}$	204	$2{,}2\cdot10^{18}$
Si<P,Eu>-6	*p*	$1.2\cdot10^{-2}$	309	$1{,}68\cdot10^{17}$

The penetration depth of the impurity atoms into silicon, as well as the distribution of the diffused atoms, was determined both theoretically and experimentally.

$$x = 2\sqrt{Dt}\sqrt{\ln\frac{C_n}{C}} = \sqrt{4Dt\ln\frac{C_n}{C}} \qquad (4)$$

$$C(x,t) = C_0 erfc\left(\frac{x}{2\sqrt{Dt}}\right) \qquad (5)$$

Theoretically, the diffusion penetration depth at **T = 1250 °C** for **t = 10 hours** for the europium impurity atoms was found to be $x_{Si<EuO>}$=15.05 **μm.**

In order to determine the concentration distribution of impurity atoms in monocrystalline silicon doped with europium atoms, a layer-by-layer removal method was employed. Based on the technological processes shown in **Figure 3**, a chemical solution with a ratio of $1HF+16HNO_3+16CH_3COOH$ (1:16:16) was used.

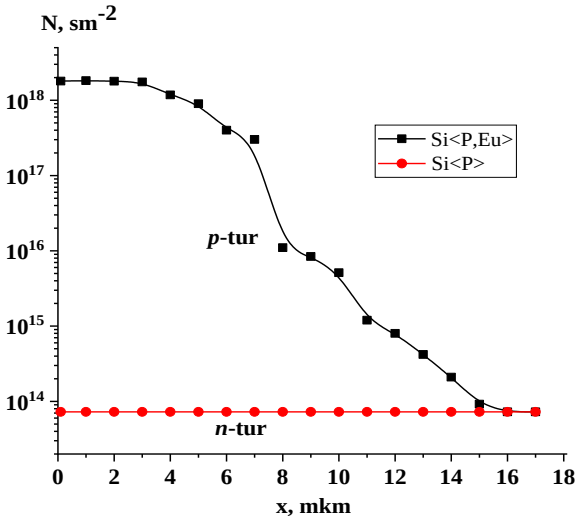

Figure 4. Depth distribution of europium impurity atoms introduced into silicon at a temperature of T = 1250 °C for t = 10 hours.

The rate of chemical etching of the silicon surface depends on temperature. Therefore, special attention was paid to maintaining a constant laboratory room temperature during the chemical etching of the silicon surface and the measurement process. The mixture was divided into **15–20 equal parts,** and each portion of the mixture was used for measuring the corresponding layer thickness.

Using chemical etching, the distributions of **specific resistivity, charge carrier concentration,** and **mobility** as a function of penetration depth were determined by sequentially removing 1 μm layers from the sample surface. In parallel, the **type of conductivity** was also identified (**see Fig. 4**). It was found that in the surface region of the silicon samples, the charge carrier concentration was $N_{Si<EuO>}=1.8\cdot10^{18}$ **cm⁻².** Beyond a depth of **15–16 μm**, the samples exhibited the **electrophysical parameters and conductivity type** corresponding to the initial (undoped) silicon.

CONCLUSION

Based on the experimental results of europium atom diffusion into silicon in the gaseous phase and using modern analytical equipment, the **optimal diffusion technology** for doping silicon with europium atoms was determined. The optimal parameters include **ampoule pressure, impurity atom concentration, diffusion time and temperature,** and other relevant conditions. Experimentally, the **time dependence of the surface layer etching** of the samples was also established using **chemical etching** with a mixture of **hydrofluoric acid, nitric acid, and acetic acid**.

TECHNOLOGY FOR DETERMINING SALTS ON THE SURFACE OF PRODUCTS MADE FROM CERAMIC MATERIALS

Bazarova S.J., Kudyarova K.K.
Karakalpak State University named after Berdakh

Summary: *This article studies the reasons for the formation of salt deposits (efflorescence) on the surface of ceramic products, ways of identification of efflorescence by chemical as well as physical methods, and ways of prevention of efflorescence formation. Chemical composition studies of surface salts of ceramic products involved the use of techniques such as X-ray diffraction (XRD), ion exchange chromatography, pH analysis, and IR spectroscopy.*

Key words: *ceramics, efflorescence, salt deposits, XRD, IR spectroscopy, ion chromatography, moisture*

1. Introduction

Ceramic materials have numerous applications in construction, artwork, electrical engineering, as well as in the chemical field. Nevertheless, one of the main factors that influence the quality of ceramic products is the formation of salt deposits, also known as efflorescence, on the surface of the material. This condition is mostly observed in the presence of water-soluble salts.[1]

Efflorescence not only damages the aesthetic qualities of ceramics but also affects the strength properties and water permeability of the material. Hence, the discovery of the mechanisms of salt formation and technologies of detecting them is a pressing issue.[2]

2. Materials and Methods

This experiment took place at the Laboratory of Inorganic Substances' Technology, Karakalpak State University. In this experiment, the following techniques of analysis are used:

X-ray Diffraction (XRD):Used to analyze crystalline phases of the salt on the surface of the

Ion Exchange Chromatography: For analysis of Na+, K+, Ca^{2+}, Mg^{2+}, Cl-, SO_4^{2-}, and NO

Infrared (IR) Spectroscopy: This is employed in order to identify the characteristic IR bands of SO_4^{2-},

pH Measurement

To measure the Alkalinity of surface solution.

Moisture analysis: To analyze the water content prior to as well as after the process of drying.

3. Results and Discussion

3.1. Composition of Surface Salts

XRD results confirmed the presence of Na_2SO_4, K_2SO_4, $CaCO_3$, and $MgSO_4$. These salts originate from sulfate and carbonate ions present in the clay and additives used in ceramic manufacturing.

Ion concentration results:

Ion Type	Average Concentration (mg/L)	Source
Na^+	45–60	Na_2O in clay
K^+	30–45	Feldspars
Ca^{2+}	25–40	Kaolinite, dolomite
SO_4^{2-}	40–65	Gypsum impurities
CO_3^{2-}	20–35	Carbonate minerals

IR spectra showed strong absorption peaks between 1100–1400 cm^{-1} corresponding to sulfate groups, supporting the XRD findings.

Measured pH values of 8.0–9.5 indicated a weakly alkaline environment, promoting salt migration toward the surface.

3.2. Mechanism of Salt Formation

During drying and firing, water containing dissolved salts moves upward through capillary pores. As the water evaporates, salts crystallize on the surface.

$$\text{Dissolved salts}\frac{\text{capillary diffusion}}{\text{evaporaátion}} > \text{Crystallized salts(surface)}$$

The intensity of this process depends on:

Soluble salt concentration in raw materials,
Drying temperature and rate,
Moisture gradient, and
Pore and crack structure.

4. Prevention of Efflorescence

4.1. Raw Material Purification

Washing and Sedimentation: Washing clay at 40–50°C for 2–3 hours reduced soluble salts by 65–80%.

Chemical Neutralization: Addition of 0.2–0.5% $BaCO_3$ or $Ba(OH)_2$ neutralizes soluble sulfates:

$$Na_2SO_4 + BaCO_3 \rightarrow BaSO_4\downarrow + Na_2CO_3$$

4.2. Additives and Modifiers

Calcium stearate (0.1–0.3%) – forms a hydrophobic layer;
Silane-based hydrophobizers – limit capillary moisture;
Barium carbonate – neutralizes sulfates;
Sodium aluminate – binds chloride and nitrate ions.

4.3. Drying and Firing Optimization

Gradual temperature rise from 60°C to 110°C;
Relative humidity 45–55%;
Duration 10–12 hours.

At 950–1050°C, sodium sulfate transforms into stable silicate phases.

4.4. Structural Densification

Porosity reduction through increased compaction and addition of fluxes such as feldspar or nepheline decreases efflorescence by up to 90% (SEM analysis).

4.5. Surface Coatings

- **Sodium or potassium silicate coatings** form protective SiO_2 films.
- **Acrylic or epoxy resins** make the surface hydrophobic.
- **TiO_2 and SiO_2 nanocoatings** provide UV resistance and block ion migration.

4.6. Storage Conditions

Maintain relative humidity below 60%, avoid damp supports, and ensure proper ventilation and stable temperature.

5. Integrated Industrial Approach

Combining several preventive measures yields the highest efficiency:

1. Washing + $BaCO_3$ neutralization,
2. Controlled drying + hydrophobic surface treatment,
3. Continuous ion chromatography monitoring.

As a result, efflorescence defects decreased from **12–15% to 1–2%** in industrial trials.

Aspect	Method	Main Effect
Raw material	Washing, $BaCO_3$ neutralization	Reduces soluble salts
Additives	Calcium stearate, silanes	Limits capillary movement
Process	Controlled drying/firing	Reduces salt migration
Structure	Densification, fluxes	Decreases porosity

Aspect	Method	Main Effect
Surface	Silicate/nano coatings	Prevents salt crystallization
Storage	Humidity control	Prevents post-production efflorescence

6. Conclusion

Conclusion It is shown that a surface layer of salt deposits that forms on ceramics is composed of sodium and calcium sulfates, which come from soluble components.

A combination of various means—chemical, physical, as well as structural—helps effectively inhibit efflorescence and is also beneficial in terms of aesthetics as well as increased mechanical These techniques, including XRD, ion chromatography, and IR spectroscopy, enabled full analysis of the salts' chemical properties. Anti-Efflorescence technology that has been developed has been proven in practice, having high industrial applicability.

THE DEVELOPMENT AND APPLICATION OF ARTIFICIAL INTELLIGENCE IN EDUCATION

Tleubayeva G.
Nukus State Technical University

Summary: *This paper explores the development, types, and applications of artificial intelligence (AI) and machine learning (ML) technologies in education. It highlights the historical evolution of automated assessment systems, the role of AI algorithms in evaluating and identifying gifted students, and their integration into pedagogical processes. The study concludes that AI technologies enhance objectivity, personalization, and efficiency in education.*

Key words: *Artificial Intelligence, Machine Learning, Automated Assessment, Personalized Learning, Gifted Students, Educational Technology.*

History of the development of automated assessment systems in the education system: The development of automated assessment systems in the education system is closely related to the development of technology and changes in pedagogical approaches. This process can be divided into several stages. For example, the initial period falls on the 1950s-1970s. During this period, the first steps in computerization were taken, and test automation and programmed learning were implemented. The first automated assessment systems were used to process tests. For example, optical mark recognition systems (OMR) allowed scanning answer sheets and outputting results. Based on Skinner's concept of "Programmed Learning", simple algorithms were created to test student knowledge. In the 1970s-1990s, computer-based assessment systems were created. CBT (Computer-Based Testing) - the creation and evaluation of test tasks using a computer expanded. During this period, test tasks became closed-ended (multiple answer options), and their automatic evaluation was established. Adaptive testing mechanisms appeared in some advanced systems. This method allowed the student to select subsequent questions based on previous answers. The development of the Internet and online education fell on the 1990s-2000s. During this period, online testing platforms and interactive assessment systems began to be created. As the Internet became more widespread, distance learning and online testing systems appeared. For example, Moodle, Blackboard and other LMS (Learning Management System) systems were introduced. Interactive tasks appeared, which served to increase student activity. Since the 2000s, the era of artificial intelligence and machine learning began and has been developing to this day. During this period, artificial intelligence-based assessment (automatic assessment of written work based on AI, speech analysis), NLP (Natural Language Processing - automatic assessment of essays and answers to open-ended questions through text analysis and understanding), personalized assessment (monitoring the student's unique learning process and personalized assessment directions) and predictive analytics (data analysis to predict student achievements and difficulties in advance) emerged. Today, automated assessment systems are further improved based on artificial intelligence and big data, playing an important role in identifying gifted students and developing individual educational directions.

Main types of artificial intelligence algorithms: The development of artificial intelligence technologies in modern education is especially important in automating the processes of identifying gifted students and assessing them. Below, the main types of artificial intelligence algorithms, their essence and possibilities of application in education are discussed.

Machine Learning (ML) - Machine learning algorithms learn to make independent decisions based on historical data and in new situations. There are supervised learning, unsupervised learning and reinforced types - in supervised learning, input and output data are given, while in unsupervised learning, only input data is given. Reinforcement learning is learned through actions and rewards.

They are used in education to identify gifted students based on analytical indicators and automatically predict assessment results. Neural Networks (NN) - Works on the principle of the human brain. It transmits information through layers and learns complex connections. There are

simple artificial neural networks, convolutional neural networks, recurrent neural networks. These are used in education to deeply analyze test results and identify defects in student responses. Expert Systems (ES) - Make decisions based on the knowledge of human experts by placing them in a database. This algorithm is used in education to use expert assessment systems that determine the level of knowledge in a particular subject and individual counseling systems for students.

Natural Language Processing (NLP) - The understanding and use of human language by a computer system. It is used in education to automatically evaluate written answers and analyze students' text assignments.

Decision Trees - Each node represents a decision point, evaluates data based on "if/then" rules.

Bayesian Classifier - Makes decisions based on statistical probabilities.

Both of these are used in education to classify a student as gifted or average based on answers and to recommend an individual educational path.

Comparative analysis of algorithms:

Algorithm type Adaptability Recommendation system Evaluation Written analysis Statistical basis

Machine Learning High Yes Yes Limited Medium

Neural Networks Very high Yes Yes Medium Low

Expert Systems Medium Great Yes Limited High

NLP Medium Limited Yes Very good Low

Decision Tree/Bayes High Yes Yes Limited High

Various forms of artificial intelligence algorithms play an important role in education, especially in the assessment of gifted students. Each algorithm has its own advantages and limitations. The combined use of these algorithms in an adapted manner allows you to create a comprehensive and effective assessment system for identifying gifted students.

The role of artificial intelligence and machine learning in the education system: One of the approaches that meets the modern needs of the education system in the context of digital transformation is artificial intelligence and its main component, machine learning technologies.

These technologies allow not only assessment, but also personalization of education, increasing efficiency, deepening knowledge, and identifying gifted students.

The main functions of artificial intelligence and machine learning in education

Function Role in education

Automated assessment Automatically analyzes tests, written answers, and interactive tasks.

Personalized education Determines the appropriate educational path for each student.

Developing creativity Develops independent thinking and problem-solving skills.

Cognitive diagnostics Provides a deep analysis of the student's knowledge.

Identifying gifted students Identifies gifted students based on specific indicators.

Reducing subjectivity in assessment Provides assessment free from the subjective opinion of the teacher.

The role of artificial intelligence and machine learning technologies according to the stages of the educational process

Stage Artificial intelligence and machine learning approach

Teaching Individual delivery of knowledge through intelligent recommendation systems

Learning Dynamic resources, tests and flexible tasks

Assessment Deep and automated analysis of learned knowledge

Correction (correction) Identification of shortcomings and development of individual recommendations

Result analysis Final conclusions through Big Data and predictive (human) analysis

Algorithm for identifying gifted students based on artificial intelligence and machine learning (simplified scheme)

1. Input data:

- Academic performance,
- Critical thinking test,

- Social activity,
- Portfolio and competition results,
2. Data cleaning and normalization.
3. Algorithmic model:
- Machine learning: decision tree + neural network,
- Classification: “Gifted”, “Average”, “Needs additional attention”,
4. Personalization of the educational path based on the results.

The integration of artificial intelligence and machine learning technologies into education improves the quality of teaching, ensures objectivity of assessment, and expands the possibilities of identifying gifted students. These technologies serve as a strategic tool for digitizing and optimizing all stages of the pedagogical process.

Opportunities for using artificial intelligence in pedagogical processes: The modern education system is rapidly digitizing, and artificial intelligence technologies are playing an important role in this process. Artificial intelligence creates broad opportunities for personalizing education, automating assessment, adapting educational resources, and identifying gifted students.

The use of Artificial Intelligence in pedagogical processes not only improves the quality of the learning process, but also takes the interaction between the teacher and the student to a new level.

The main pedagogical functions of artificial intelligence tools:

-Adaptive learning: Content is provided that is appropriate for the student's level of knowledge and learning style.

-Automated assessment: The results of tests, written work, and laboratory work are quickly and accurately analyzed using artificial intelligence.

-Assistant role for the teacher: Artificial intelligence helps the teacher monitor student activity, identify knowledge gaps, and improve approaches.

-Recommendation systems: Artificial intelligence provides recommendations to the student when choosing an individual subject, course, or major.

Main areas of integration of SI technologies into the pedagogical process:

Direction Implementation forms Examples

Assessment Intellectualized tests, essay evaluation AI Exam, Gradescope

Personalization of learning Adaptive courses, real-time analysis Smart Sparrow, Knewton

Identification of gifted students Algorithmic sorting, behavioral analysis Neural networks, regression models

Learning resource management Chatbots, virtual teachers Duolingo, Squirrel AI

Assistance services Speech recognition, translation, text analysis GPT, DeepL, Grammarly

Gifted language

SUSTAINABLE OPTIMIZATION OF ENERGY BALANCE IN SOLAR PHOTOVOLTAIC SYSTEMS USING PSO, JAYA AND SOCP ALGORITHMS

Djaykov G.M[1]., Baymuratova G.T[2].
[1]*Nukus State Technical University*
[2]*Tashkent University of Information Technologies named after Muhammad al-Khwarizmi*
gulayim0298@gmail.com

Summary: *This article analyzes mathematical models and computational algorithms aimed at sustainable optimization of the energy balance in PV systems. The research is based on advanced approaches proposed for 2020-2024, aimed at minimizing the imbalance between solar energy production, energy storage systems, and load using PSO (Particle Swarm Optimization), JAYA (Optimization Algorithm), and SOCP (Second Order Cone Programming) algorithms. At the same time, production and load profiles were adapted, stress stability was ensured, and technical losses were reduced. The results showed that the system efficiency increased to 93%, and the imbalance decreased from 42.5 kWh to 25.1 kWh. Hybrid algorithms are proposed as an effective solution to ensure the economic and technical stability of solar energy systems in the conditions of Uzbekistan.*

Key words: *solar energy, energy balance, mathematical model, PSO, JAYA, SOCP, optimization, voltage stability, energy systems.*

Introduction

In the last decade, renewable energy sources, in particular solar energy, have become one of the strategic directions of the global energy sector. As a result of the decrease in the cost, technological improvement, and increased efficiency of solar photovoltaic systems (PS), PV systems have become an integral part of the energy system in many countries. According to the International Energy Agency (IEA), solar energy accounted for more than 60% of the world's new generation capacity in 2022. However, the natural variability of solar radiation causes an imbalance between the energy produced and the load. As a result:

- voltage fluctuations occur in the networks,
- increase in technical losses,
- stability decreases,
- economic efficiency decreases.

The Republic of Uzbekistan, in particular the Republic of Karakalpakstan, is one of the leading regions in Central Asia in terms of solar radiation - there are more than 300 sunny days a year. However, existing networks are not ready for full integration with PV systems. Therefore, it is necessary to introduce methods of mathematical modeling and optimization.

Recent research in the field of solar photovoltaic (PV) energy systems has primarily focused on addressing the issues of stability, efficiency, and optimization under variable environmental and operational conditions. According to [1], one of the key challenges in solar energy systems is the instability caused by fluctuations in solar radiation and the limited efficiency of storage systems. The study examined several optimization approaches that combine linear, dynamic, and heuristic methods, resulting in an 8-12% improvement in overall system efficiency. The authors highlighted that hybrid optimization models can effectively balance energy generation and storage processes, although the absence of real-time operational data remains a practical limitation.

In the article presented in [2], the integration of PV systems into existing power grids was analyzed with particular attention to dispatch and load management problems. The authors proposed control methods based on the Particle Swarm Optimization (PSO) algorithm and evolutionary techniques, which enabled a 15–20% reduction in dispatch costs. However, the study also noted that such algorithms require further enhancement to improve real-time adaptability. This research confirmed the effectiveness of PSO as a mathematical foundation for network-level optimization in solar energy systems.

Further advancements in predictive modeling were made in [3], where ensemble machine learning algorithms-combining Random Forest, XGBoost, and artificial neural networks-were used to forecast PV power generation. The ensemble approach improved prediction accuracy by approximately 25% compared to single models, which significantly enhanced the reliability of energy production planning and load distribution management.

The application of the JAYA optimization algorithm in [4] focused on determining the optimal placement and capacity of photovoltaic and battery energy storage (BES) systems. The model considered technical, economic, and reliability constraints, resulting in reduced operational costs and faster convergence to optimal solutions. The findings demonstrated the efficiency of JAYA in achieving balanced and high-performance configurations of PV-BES systems.

In a related article [5] introduced the Second Order Cone Programming (SOCP) model to improve voltage regulation in hybrid wind-solar networks. Through the integration of control devices such as SVC, OLTC, and BES, the proposed model significantly enhanced voltage stability and reduced oscillations, leading to improved network reliability.

Collectively, these studies demonstrate a clear progression in optimization methodologies applied to solar energy systems-from heuristic algorithms like PSO and JAYA to mathematical and hybrid approaches such as SOCP and ensemble machine learning. The combination of these methods contributes to increased efficiency, enhanced system stability, and improved economic performance, indicating the importance of multi-criteria optimization in the sustainable development of solar energy technologies.

Ensuring the energy balance between production and consumption in solar generation systems is one of the most pressing issues of modern energy systems. Due to natural fluctuations of solar radiation, variability of the load profile, and limitations of energy storage technologies, production and consumption indicators in real time do not correspond to each other.

Therefore, the research methodology covered the following stages :

1. Collection of technical parameters of solar radiation, PV and BES.
2. Creation of a mathematical model reflecting the energy flow.
3. Objective function (minimization of imbalance) and formation of constraints.
4. Selection and application of PSO, JAYA, and SOCP algorithms.
5. Modeling and calculation based on real data.
6. Analyze the results based on tables and graphs.

Stage of optimization algorithms. In modern power systems with a high share of solar energy, ensuring a stable energy balance between production and consumption requires the use of effective optimization algorithms. One of the most promising approaches is metaheuristic algorithms, which are distinguished by flexibility, resistance to nonlinear systems, computational efficiency, and the ability to find solutions close to the global minimum. In this research, three algorithms - PSO, JAYA, and SOCP - were selected and analyzed to solve the problem of energy balance. Each is used at different stages of system control and optimization.

PSO (Particle Swarm Optimization) - particle swarm algorithm. The PSO algorithm belongs to evolutionary computational methods and models the movement of a flock of birds or the natural movement of a flock of fish. Each "particle" is a possible solution to the problem (for example, a combination of solar panel power and energy storage capacity) .

In the PSO (Particle Swarm Optimization) algorithm, particles move through the search space based on their own best state and the collective best state of the swarm. This approach allows the algorithm to efficiently explore and exploit the search space to find optimal or near-optimal solutions. One of the main advantages of PSO is that it does not require derivatives for calculations, making it suitable for problems where gradient information is difficult to obtain. Additionally, it performs effectively on multidimensional and nonlinear functions and demonstrates high accuracy in finding solutions close to the global optimum.

Mathematical expression:

$$v_i(t+1) = wv_i(t) + c_1 r_1\big(p_i - x_i(t)\big) + c_2 r_2\big(g - x_i(t)\big)$$

$$x_i(t+1) = x_i(t) + v_i(t+1)$$

v_i - velocity of the i-th particle,
x_i - particle position,
p_i - the best found state of the particle,
g - global best solution,
w - coefficient of inertia
c_1, c_2 - learning coefficients,
$r_1 r_2$ - random numbers in the interval [0, 1].

The PSO (Particle Swarm Optimization) algorithm is widely applied in solar energy systems to enhance performance and efficiency. It is used to select the optimal power capacity of photovoltaic (PV) panels according to the load profile, determine the optimal capacity of energy storage systems, and minimize the imbalance between energy production and consumption. Practical experience demonstrates that applying PSO in solar systems can reduce energy imbalance by 15-20% while significantly improving both technical and economic efficiency.

JAYA algorithm (Optimization Algorithm) - optimization without adjustment parameters. The JAYA algorithm is a new metaheuristic approach proposed by Rao in 2016. “Jaya” means “victory” in Sanskrit. The main idea of the algorithm is that in each iteration, the approach to the best solution and the departure from the worst solution are carried out.

A difference from PSO is that the JAYA algorithm does not require adjustment of additional coefficients, which gives a great practical advantage.

Update formula:

$$X_{i,j}^{new} = X_{i,j}^{current} + r_1(X_{best,j} - \left|X_{i,j}^{current}\right| - r_2(X_{worst,j} - |X_{i,j}^{cuurent}|$$

here

X_{best} - the best solution,
X_{worst} - the worst solution
r_1, r_2 - random numbers [0,1],
i - solution number,
j - number of dimensions.

The JAYA algorithm is effectively applied in solar energy systems to achieve optimal performance and stability. It is used for optimizing the location and configuration of solar stations, determining the optimal ratio between energy production and storage, stabilizing the network mode under varying consumer load conditions, and reducing operating costs. Research results show that optimizing the energy balance using the JAYA algorithm can reduce operational costs by up to 18% and enhance the overall stability of the system by up to 20%.

SOCP (Second Order Cone Programming) - second-order cone programming. SOCP is a powerful mathematical tool designed to solve convex optimization problems and is widely used in the management of electrical networks, especially for voltage regulation and flow control in hybrid solar systems.

The SOCP method is applied in solar energy systems to improve control and stability of power networks. It is used for voltage regulation, efficient distribution of energy flows, control of compensation devices, and maintaining overall network stability. By applying SOCP-based optimization, solar energy systems can achieve more reliable performance and balanced power distribution under varying operating conditions .

Mathematical form:

$$min_x c^T x$$
$$||A_i x + b_i||_2 \leq c_i^T x + d_i., i = 1, \dots, m$$

The SOCP algorithm is widely used in solar energy systems to enhance network reliability and optimize power management. It enables voltage regulation in networks with a large number of photovoltaic (PV) sources, provides optimal control of compensation devices such as SVC and OLTC, smooths production fluctuations using energy storage systems, and helps maintain voltage quality while improving the overall stability of the network .

The main advantages of the SOCP algorithm include its guaranteed approach to achieving a global optimal solution, the ability to incorporate multiple technical and engineering constraints, and its suitability for real-time applications through the use of fast and efficient solvers such as CPLEX and GUROBI.

Results and analysis

Within the framework of the research, a mathematical model was developed for optimizing the integration of solar photovoltaic (PV) and battery energy storage systems (BES) based on PSO, JAYA, and SOCP algorithms. The model was tested based on a 24-hour load profile. The purpose of the study was to reduce the imbalance between production and load, increase system stability, and minimize technical losses.

The table below compares the indicators of energy imbalance, power losses, system efficiency, and stability coefficient as a result of applying various algorithms:

Indicators	Base System	PSO	JAYA	SOCP	Hybrid JAYA+SOCP
Energy imbalance (kVt·soat)	42.5	33.8	31.4	28.9	25.1
Power Losses(%)	11.2	8.7	7.9	6.5	5.8
System stability factor	0.82	0.91	0.94	0.96	0.98
Average system efficiency (%)	76	86	89	91	93
Savings in operating costs(%)	-	11	14	16	19
Calculation time (seconds	-	12	9	21	18

The analysis shows that each optimization algorithm contributes uniquely to improving the performance of solar energy systems. Using the PSO algorithm reduced the energy imbalance to 20%, achieving an overall efficiency of 86%. The JAYA algorithm demonstrated an excellent balance between computational speed and solution quality, increasing efficiency to 89%. The SOCP algorithm provided precise voltage control, resulting in a system stability level of 0.96. Moreover, the hybrid approach combining JAYA and SOCP produced the best overall results, reducing the energy imbalance to 25.1 kWh, achieving 93% efficiency, and ensuring a high network stability of 0.98.

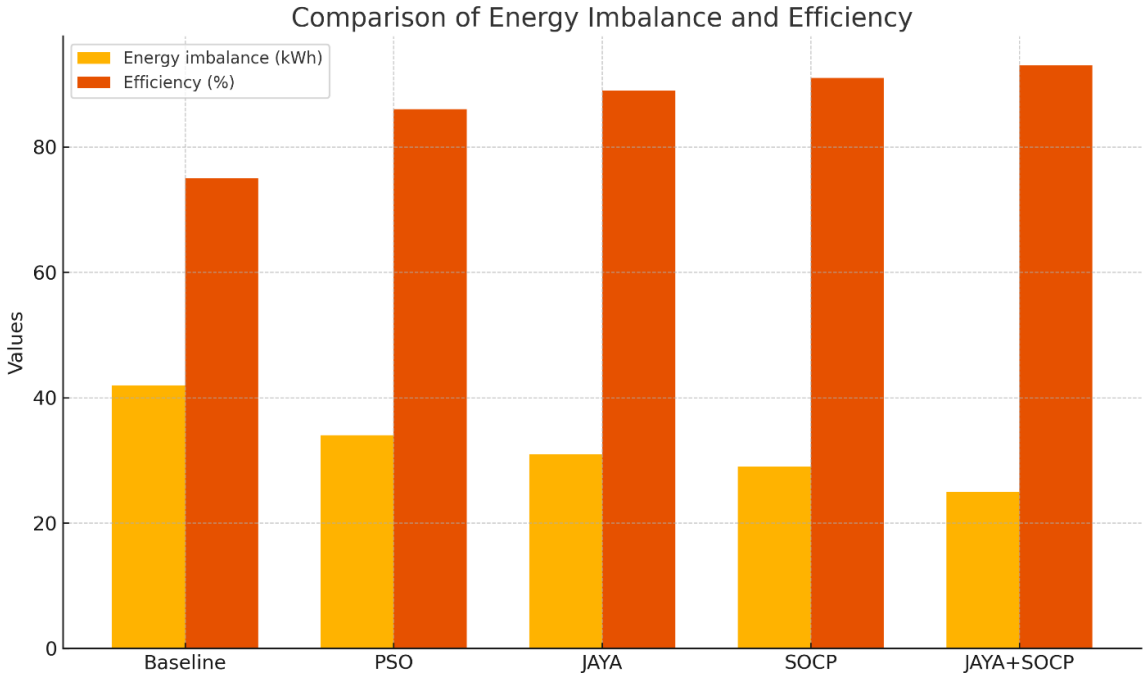

Figure 1. Daily energy balance profile comparison.

The load and production profiles in the solar energy system were optimized using the PSO and JAYA algorithms, allowing for better alignment between energy generation and consumption. The hybrid JAYA+SOCP approach further enhanced system performance by producing a smoother and more stable output graph during peak load conditions, effectively minimizing fluctuations and improving overall operational stability.

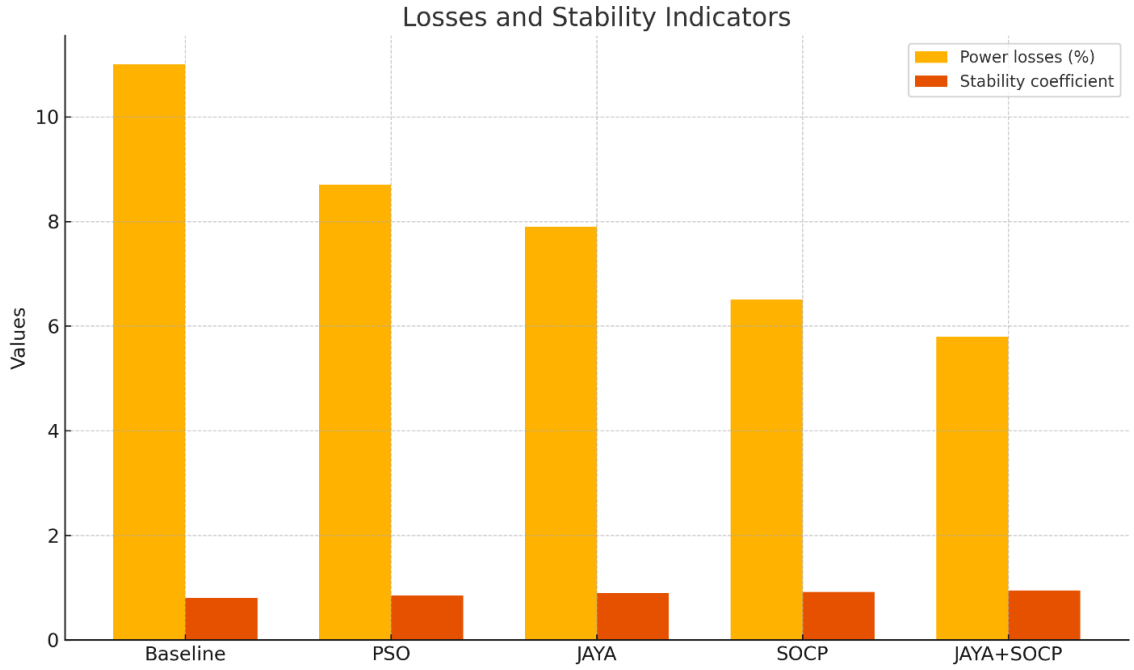

Figure 2. Reduce losses and increase stability

The analysis shows that system losses decreased from **11.2% to 5.8%,** while the overall **efficiency increased to 93%,** indicating a significant improvement in both technical performance and network stability.

Analytical comparison of algorithmic solutions. The analytical comparison of different optimization algorithms demonstrates their unique strengths and performance characteristics. The

PSO algorithm proved to be efficient but requires parameter adjustment to achieve optimal results, showing good performance in reducing energy imbalance. The **JAYA algorithm** provided a fast and stable solution without the need for parameter tuning, exhibiting high computational speed. The **SOCP algorithm** demonstrated high accuracy in voltage regulation and power flow control. Finally, the **hybrid JAYA+SOCP approach** combined the advantages of both methods, ensuring maximum efficiency and improved overall system stability.

Overall performance indicators

Indicators	Initial	JAYA+SOCP
Imbalance (kWh)	42.5	25.1
Power loss (%)	11.5	5.8
Efficiency (%)	76	93
Stability coefficient	0.82	0.98

These results demonstrate the practical effectiveness of managing the energy balance in solar systems using mathematical models and advanced optimization algorithms. The JAYA+SOCP approach has maximized technical, economic, and environmental efficiency.

Conclusion

Analysis of the literature and research results show that the combined use of mathematical models and optimization algorithms in stabilizing the energy balance in solar photovoltaic systems is one of the most effective approaches. Natural variability in the volume of solar energy production causes imbalance, voltage fluctuations, and technical losses in the system. In solving these problems, such algorithms as PSO, JAYA, and SOCP proved themselves to be highly effective solutions. The PSO algorithm yielded an effective result in reducing energy imbalance through rapid adjustment of system parameters, however, it requires careful adjustment of parameters to ensure accuracy. The JAYA algorithm ensured faster and more stable solution without the need for parameter adjustment, which is practically very convenient. The SOCP algorithm provided an accurate mathematical solution for voltage regulation, power flow balancing, and increasing network stability.

The highest result was achieved with the JAYA+SOCP hybrid approach: the energy imbalance was reduced to 25.1 kWh, the system efficiency was increased to 93%, and the stability coefficient was brought to 0.98.

In conclusion, combining PSO, JAYA, and SOCP algorithms with mathematical models is one of the most promising approaches to ensuring a stable energy balance in solar energy systems, increasing technical stability, and reducing operating costs. This will be an important scientific and practical step not only in modernizing the energy system, but also in strengthening the energy independence of Karakalpakstan and effectively implementing the “Green Energy” policy in the conditions of Uzbekistan.

METHODS OF PURIFICATION OF COLLECTOR DRAINAGE WATERS AND THE POSSIBILITIES OF THEIR REPEATED USE

Jangabayev D.M[1]., Khojamuratova R.T[2].
[1]*Irrigation and Water Problems Research Institute*
[2]*Karakalpak State University named after Berdakh*

Summary*: The article examines the main pollutants of collector-drainage waters (CDW), their chemical and physicochemical composition, and related environmental risks for agriculture and the environment. Particular attention is paid to the problems of soil salinization, surface and groundwater pollution, eutrophication of water bodies, and the accumulation of toxic substances in agricultural products. Factors affecting the composition of the WMC are analyzed, and the need to implement effective methods for water purification and quality monitoring for the sustainable development of the agricultural sector and the protection of natural resources is emphasized.*

Keywords: *collector-drainage waters, pollutants, mineral salts, nitrates, pesticides, soil salinization, eutrophication, biochemical oxygen consumption, environmental risks, agriculture, water purification.*

Introduction: Collector-drainage waters (CDW) are formed during the functioning of melioration systems and represent wastewater removed from excessively moistened or saline soils. Depending on natural and agrotechnological conditions, such waters may contain high concentrations of salts, pesticides, organic substances, heavy metal ions, and fertilizer residues.

Previously, CVDs were mostly discharged into rivers, lakes, and other bodies of water, contributing to their pollution. Today, in the context of growing water scarcity, climate change, and ecological limitations, the issue of purifying and reusing this water, including for technical needs, re-irrigation, or ecological landscape remediation, is becoming increasingly relevant.

Main Part: Collector-drainage waters (CDR) are complex water solutions formed as a result of the interaction of irrigation water, groundwater, and soil profile. Their composition is directly related to natural, agrotechnical, and meliorative conditions, as well as the intensity of fertilizer and chemicals used in agriculture. We can divide into 4 main factors that affect the composition of the CDP:

1. Water source

Irrigation water can carry a significant amount of dissolved salts and ions (depending on its mineralization).

Groundwater, especially in saline and lowland areas, often contains elevated concentrations of sulfates, chlorides, and sodium.

Atmospheric precipitation has a dilution effect, but its contribution may be insignificant in arid regions.

2. Soil character

In areas with saline and saline soils, CMRs contain high concentrations of salts (especially sodium salts).

Clay soils may exhibit increased water turbidity and the presence of colloids.

In swampy soils, increased values of organic matter and anaerobic decomposition products are often recorded.

3. Degree of agrochemical impact

The application of nitrogen fertilizers increases the content of nitrates and ammonium nitrogen.

Phosphorus and potassium fertilizers can enter the LSD, especially when applied excessively.

Pesticide and herbicide residues (e.g., glyphosate, 2,4-D) can also migrate into drainage water.

4. Climate and regional features

In arid and hot regions, increased evaporation is observed, which leads to an increase in the concentration of salts in the soil and, accordingly, in the FC.

In regions with a high level of groundwater mineralization (Central Asia, southern Kazakhstan, Astrakhan region, etc. CFU can have salinity comparable to sea water (more than 5 g/l). Table 1 shows the main components of CDV.

Collector-drainage waters contain various substances that can negatively affect the quality of water resources and agricultural soils when reused or discharged. The main pollutants are divided into several groups:

1. Mineral salts The main component of the DMW salt balance. The most common are: Sodium chlorides (NaCl) - form the main part of salt pollution, especially in saline and saline soils. High concentrations lead to the deterioration of soil structural properties and toxicity to plants. Magnesium sulfates (MgSO4) - affect metabolic processes in soil and plants, can enhance alkalinity. Calcium carbonates (CaCO3) - often present in alkaline soils, participate in pH buffer reactions, and affect water hardness. High mineralization of KDW contributes to the development of soil salinization processes and a decrease in their fertility.

2. **Nitrates and phosphates (fertilizer residues)** Nitrates (NO3) and ammonium compounds enter drainage waters as a result of nitrogen fertilizer application. Excessive nitrate accumulation is dangerous for aquatic ecosystems and can lead to drinking water pollution. Phosphates (PO43−) - come with phosphorus fertilizers. Increased concentrations cause eutrophication of water bodies, contributing to the excessive growth of algae and a decrease in the oxygen regime.

3. Pesticides and their metabolites Residues of herbicides, insecticides, and fungicides used to protect crops often enter the CDW. Some substances are resistant to biodegradation and can accumulate, causing toxicity for aquatic organisms and potentially entering the food chain. Examples include glyphosate, dimethoate, atrazine, and their decomposition products.

4. Organic substances and BPK (biochemical oxygen consumption) Organic pollutants come from plant residues, fertilizers, and microbiological activity in the soil. Biochemical oxygen consumption serves as an indicator of the concentration of organic matter: a high biochemical oxygen consumption indicates the presence of easily oxidizing substances that, upon decomposition, require a large amount of oxygen. Excess organic matter can lead to anaerobic conditions and soil-water degradation.

5. Microbiological contamination CDW may contain pathogenic microorganisms - bacteria (e.g., E. coli), viruses, and protozoa. They arise from the use of manure, compost, and contamination of water sources. When water is reused without proper treatment, it poses a threat to human and animal health

Table 1

Main components of cdv

Component	Approximate ranges (mg/l)	Notes
Mineralization (total salt residue)	1000-10000 and above	Depends on the region and the degree of salinity
Na+ (sodium)	200-1500	*The sodium-calcium ratio* indicator is important
Cl− (chlorides)	150-2500	Elevated concentration is toxic to most plants.
SO42− (sulfates)	300-3000	Often prevail in the composition of CDP
Ca2+ and Mg2+ (hardness)	50-800	They affect soil structure and filtration.
NO3− (nitrates)	10-100	Indicates contamination with fertilizers
PO43− (phosphates)	up to 10	Often below MPC, but may cause eutrophication
BPK5 (biochemical oxygen consumption)	5-100	Indicates the presence of organic substances
Pesticides	0.01-1.0 (μg/l)	Can be present during intensive farming
pH	6.5-9.0	The alkaline reaction is characteristic of saline areas.

Collector-drainage water plays an important role in regulating the water balance of agricultural lands. However, their composition often contains pollutants that can cause serious environmental problems when misused and reused. Let's consider the main risks in more detail.

1. Salinization of soils during repeated irrigation without proper cleaning

- CMW containing high concentrations of mineral salts (NaCl, MgSO4, etc.) when used repeatedly as irrigation water can lead to salt accumulation in the soil profile.
- Salinization worsens the physical and chemical properties of the soil, reduces its water permeability and aeration.
- High sodium content contributes to the destruction of soil structure, leads to its compaction and deterioration of plant growth.
- The result is a sharp decline in yields and land degradation.

2. Pollution of surface and groundwater when discharging CSW without filtration

- When discharged without proper treatment, salts, nitrates, pesticides, and other pollutants enter rivers, lakes, reservoirs, and groundwater.
- This leads to a deterioration in drinking water quality, a decrease in biodiversity, and the death of aquatic organisms.
- Groundwater pollution is dangerous, as these resources are often used for drinking and irrigation, and restoring their quality takes many years.

3. Eutrophication of water bodies (if nitrates and phosphates are present)

- Nitrates and phosphates from KDW are key factors in eutrophication - the excessive enrichment of aquatic ecosystems with nutrients.
- Eutrophication causes rapid growth of algae and other aquatic plants, which ultimately leads to water oxygen starvation, fish death, and deterioration of conditions for other aquatic organisms.
- This reduces water quality and creates difficulties in the economic use of water bodies.

4. Accumulation of toxic substances in agricultural products when using contaminated water

- Pesticides, heavy metals, and other toxic components present in CFU can enter plants through the roots.
- The accumulation of these substances in fruits and crops poses a risk to human and animal health.
- Long-term use of contaminated water reduces the ecological and sanitary safety of products, limiting their sale and consumption.

Controlling and reducing the concentration of these pollutants is a key condition for the safe use of collector-drainage waters in agriculture and environmental protection. Effective cleaning methods must consider the specifics of each type of contaminant to ensure environmental safety and maintain soil fertility.

The chemical composition of collector-drainage waters requires careful analysis before reuse. Special attention should be paid to the mineralization, the content of toxic ions, and the residues of agrochemicals. Correct determination of the CDP composition is the basis for choosing the purification method and making decisions about the feasibility of its secondary application.

Conclusion

To minimize environmental risks, it is necessary to:

Ensure thorough cleaning of CDW before its reuse;

- Implement water and soil quality monitoring systems;
- Develop and apply land reclamation technologies that reduce the negative impact of salts and toxins;
- Apply integrated approaches to water resource management, taking into account environmental safety.

Only a comprehensive approach to controlling and managing collector-drainage water will allow for the preservation of land fertility and environmental protection.

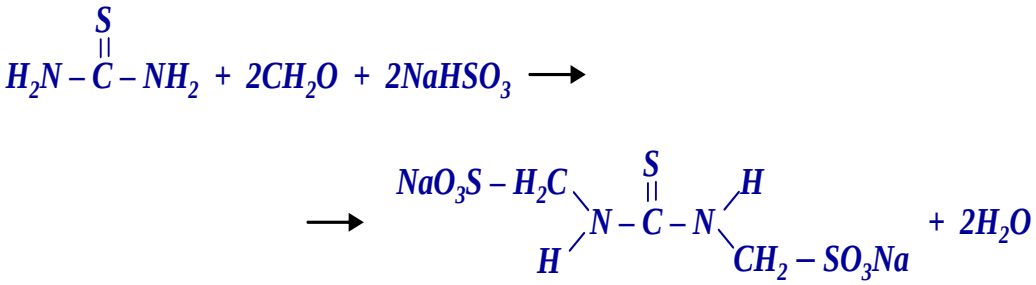
EFFECTIVE COMPOSITION OF A MINERAL SALT DEPOSITION INHIBITOR FOR USE IN OIL REFINERIES

Kaipbergenova G.R.
Karakalpak State University named after Berdakh

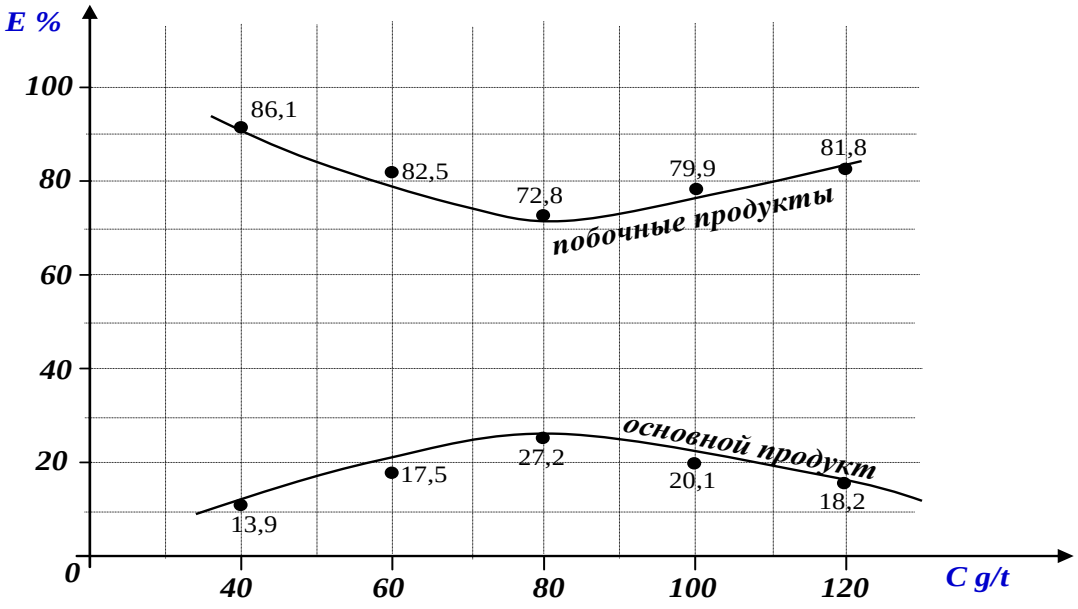
Summary: *To obtain an effective composition of scale inhibitors, the condensation process of aniline and sulfanilic acid with formaldehyde in a weakly acidic medium was studied. During the condensation of thiourea with formaldehyde in the presence of sodium bisulfite, thiourea dimethylenesulfonate (TDMSTM) is formed. The optimal yield of the synthesized TDMSTM is observed at 80°C with a reaction duration of 4 hours.*

Keywords: *scale inhibitors, condensation, aniline, formaldehyde, inhibition efficiency.*



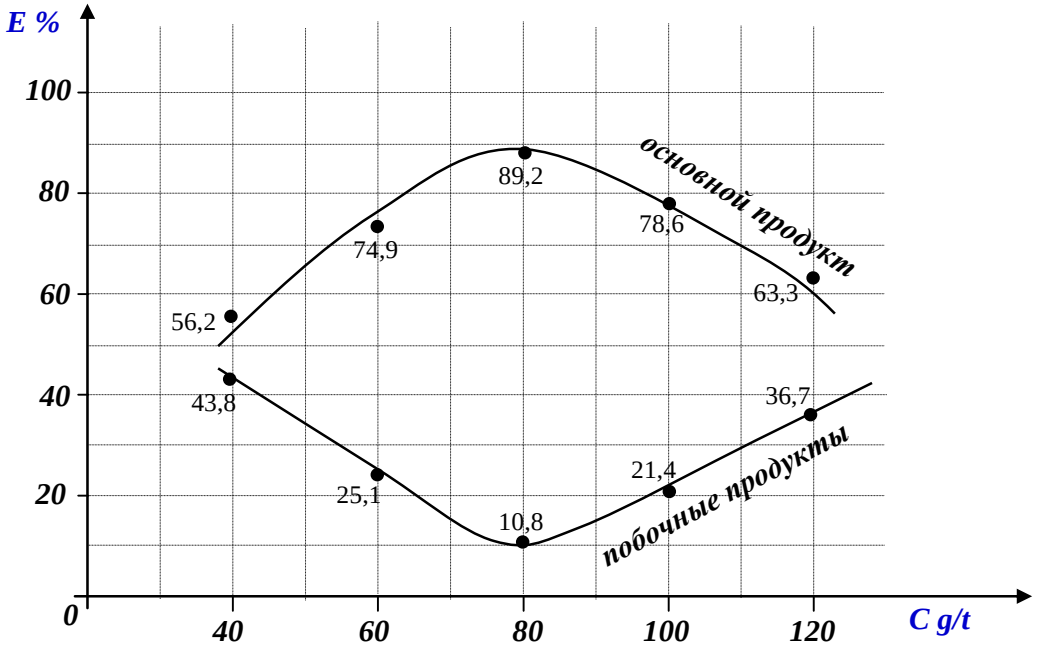
Currently, various industries utilize water containing mineral salts that requires treatment and purification both before and after use.

Annually, production facilities worldwide consume an average of 8 - 8.5 million cubic meters of water, which consequently has a negative impact on the environment and leads to shortages of drinking water.



In our republic, the supply of drinking water to the population is within normal limits; however, local production enterprises are observed to be using drinking water and contributing to its pollution.

Considering the above, in order to develop new polydentate compounds and obtain highly effective salt deposition inhibitors and ion-exchange resins based on them, the reactions of aldehydes with amines and amides were studied.



When thiourea condenses with formaldehyde in the presence of sodium bisulfite, thiourea dimethylenesulfonate (TMD) is formed according to the scheme [96; p. 30-37]:

P The reaction was carried out in a slightly alkaline medium, at different temperatures, times, and at different ratios of the initial components.

Proportion of initial substances, mol: 1:1:1

Proportion of initial substances, mol: 1:2:2

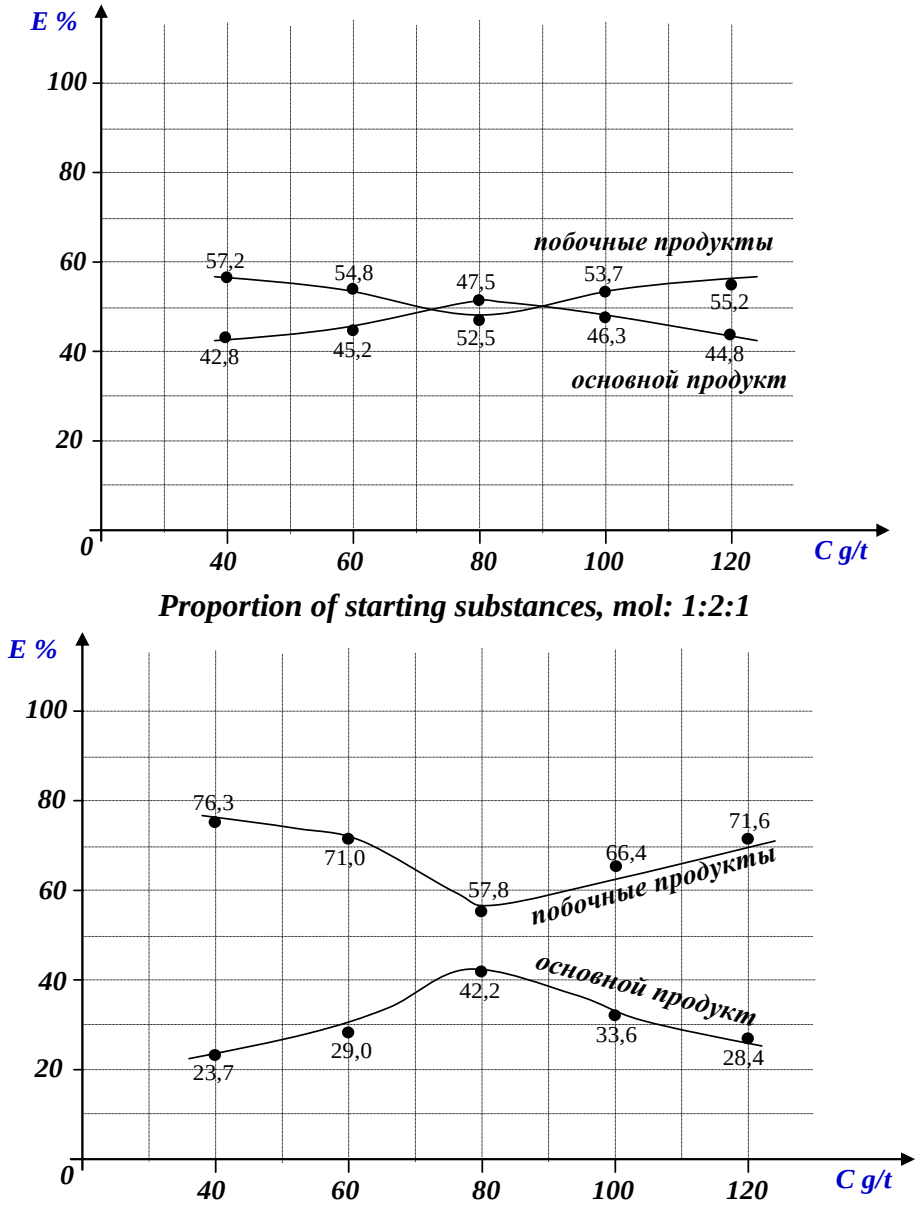


Fig. 1. Dependence of DMSTM yield on temperature and ratio of starting materials (reaction time: 3 hours)

The optimal yield of the synthesized DMSTM is observed at 80°C and a reaction duration of 4 hours. The resulting DMSTM product dissolves well in water and has been tested as an inhibitor of mineral salt deposition. At the Fergana Oil Refinery, an industrial OEDF inhibitor is used to stabilize circulating water, with a consumption rate of 1.0 to 4.0 g/m3. To reduce the hardness of water used in industrial enterprises, the synthesized DMSTM was tested as a mineral salt deposition inhibitor under real conditions.

In this regard, 65% of DMSTM was modified by adding 25% trisodium polyphosphate and 10% of the monoethanolamine vacuum distillation (MVAZ) cubic residue. The obtained composition, conventionally named IOMS - extra-II, was tested as a salt deposition inhibitor in the closed circulating water of the Fergana Oil Refinery. The results of comparing the inhibitory activity of IOMS - extra-II with the industrial OEDF inhibitor are presented in Table 1.

Table 1.

IOMC-extra-II inhibitory activity compared to EDF

Inhibitor	Inhibitor concentration, mg/l	Inhibition efficiency, %

IOMS - Extra - II	20,0	76,0
	30,0	83,0
	40,0	91,0
OEDF	20,0	30,0
	30,0	41,0
	40,0	59,0
	200,0	90,0

The table shows that the synthesized inhibitor IOMS-extra-II effectively inhibits mineral salt deposition by 91.0% at a concentration of 40.0 mg/l. In contrast, the inhibitory effectiveness of the industrial inhibitor OEDF reaches 90.0% only at a concentration of 200.0 mg/l.

Thus, new mineral salt deposition inhibitors have been synthesized based on local raw materials - urea and thiourea. A technology for producing the aforementioned salt deposition inhibitors has been developed.

Based on the conducted research, it has been established that during the condensation of urea and thiourea with formaldehyde in the presence of sodium bisulfite, their methylene sulfonate derivatives are formed. These derivatives exhibit properties of scale inhibitors with a protective effect of 90.5-92.5%. A probable mechanism for urea sulfomethylation has been proposed. After thorough analyses, it was revealed that modification of DMSTM using trisodium polyphosphate (25%) and production waste - KOVPM (10%) forms a new composition (IOMS-extra-II). The inhibitory activity of this new composition is 5 times higher than that of the industrial inhibitor OEDF.

INVESTIGATION OF THE THERMOPHYSICAL PARAMETERS OF THE COOLING SYSTEM FOR A NEW-TYPE PHOTOELECTRIC-THERMAL DEVICE

Sabirov H., AlikulovR.B.
Academy of Sciences of the Republic of Uzbekistan
Institute of Physical-Technical named after S.A. Azimov

Summary: *This paper determines the thermophysical parameters of the cooling system for an autonomous photoelectric–thermal device and studies their variations over time based on mathematical modeling and computational analysis. The simulation results show that an efficient forced convection process is organized through the combined operation of the radiator and fan system. The diurnal dynamics of liquid and air temperatures were analyzed, revealing stable heat exchange and the maintenance of device element temperatures within the standard operating range. The obtained results make it possible to develop practical recommendations for increasing the thermal efficiency of the device and reducing energy losses.*

Key words *Keywords: autonomous photoelectric–thermal system, radiator, fan, heat exchange, forced convection, energy efficiency*

In this study, the thermophysical parameters of the cooling system in an autonomous photoelectric–thermal device are determined, and the corresponding computational research results are presented. Based on these analyses, practical recommendations are developed to improve the heat exchange efficiency of the system and reduce energy losses.

Thus, the main objective of this scientific research is to theoretically analyze the energy and thermal processes of the autonomous photoelectric–thermal system through mathematical modeling and to establish a scientific foundation for optimizing the device's design.

Figure 1. Temperature variation dynamics at different times of the day (6:00–17:00). Figure 1 illustrates the diurnal temperature variation in the cooling system of a mobile solar energy device. The color gradient in the figure represents the temperature distribution along the liquid flow and its directional vectors.

During the early morning hours (6:00–8:00), when solar radiation intensity is low, the temperature difference between the inlet and outlet of the liquid is small — approximately 295–298 K. As solar radiation increases (between 9:00 and 14:00), heat accumulation on the panel surface intensifies, resulting in an outlet temperature rise up to 302–303 K. During this period, the operation of the radiator and fan system establishes a well-defined direction of heat flow, contributing to efficient cooling.

In the afternoon (15:00–17:00), due to the decrease in solar radiation, the rate of heat generation declines, and the liquid temperature gradually returns to 296–298 K. These results confirm that the cooling system, based on a radiator and fan mechanism, effectively regulates heat exchange throughout the day, maintaining the working fluid temperature within the normal operating range.

Figure 2. Airflow velocity distribution (left) and streamlines (right) in the cooling system. Figure 2 shows the airflow velocity distribution (left) and the streamlines (right) in the cooling system of the mobile solar energy device. The computational results clearly demonstrate the formation of forced convection under the influence of the fan.

In the velocity field diagram on the left, the maximum airflow velocity at the center of the fan reaches 4.5–5.0 m/s, indicating strong air movement between the radiator channels. Around the radiator, the airflow velocity remains within 2–3 m/s, ensuring stable heat transfer in these zones.

The streamline diagram on the right illustrates the circular airflow generated by the fan and the direction of heat transfer along the radiator. The airflow originates from the fan center, spreads upward and laterally, then descends again, forming a recirculating convection pattern that enhances the cooling efficiency of the system.

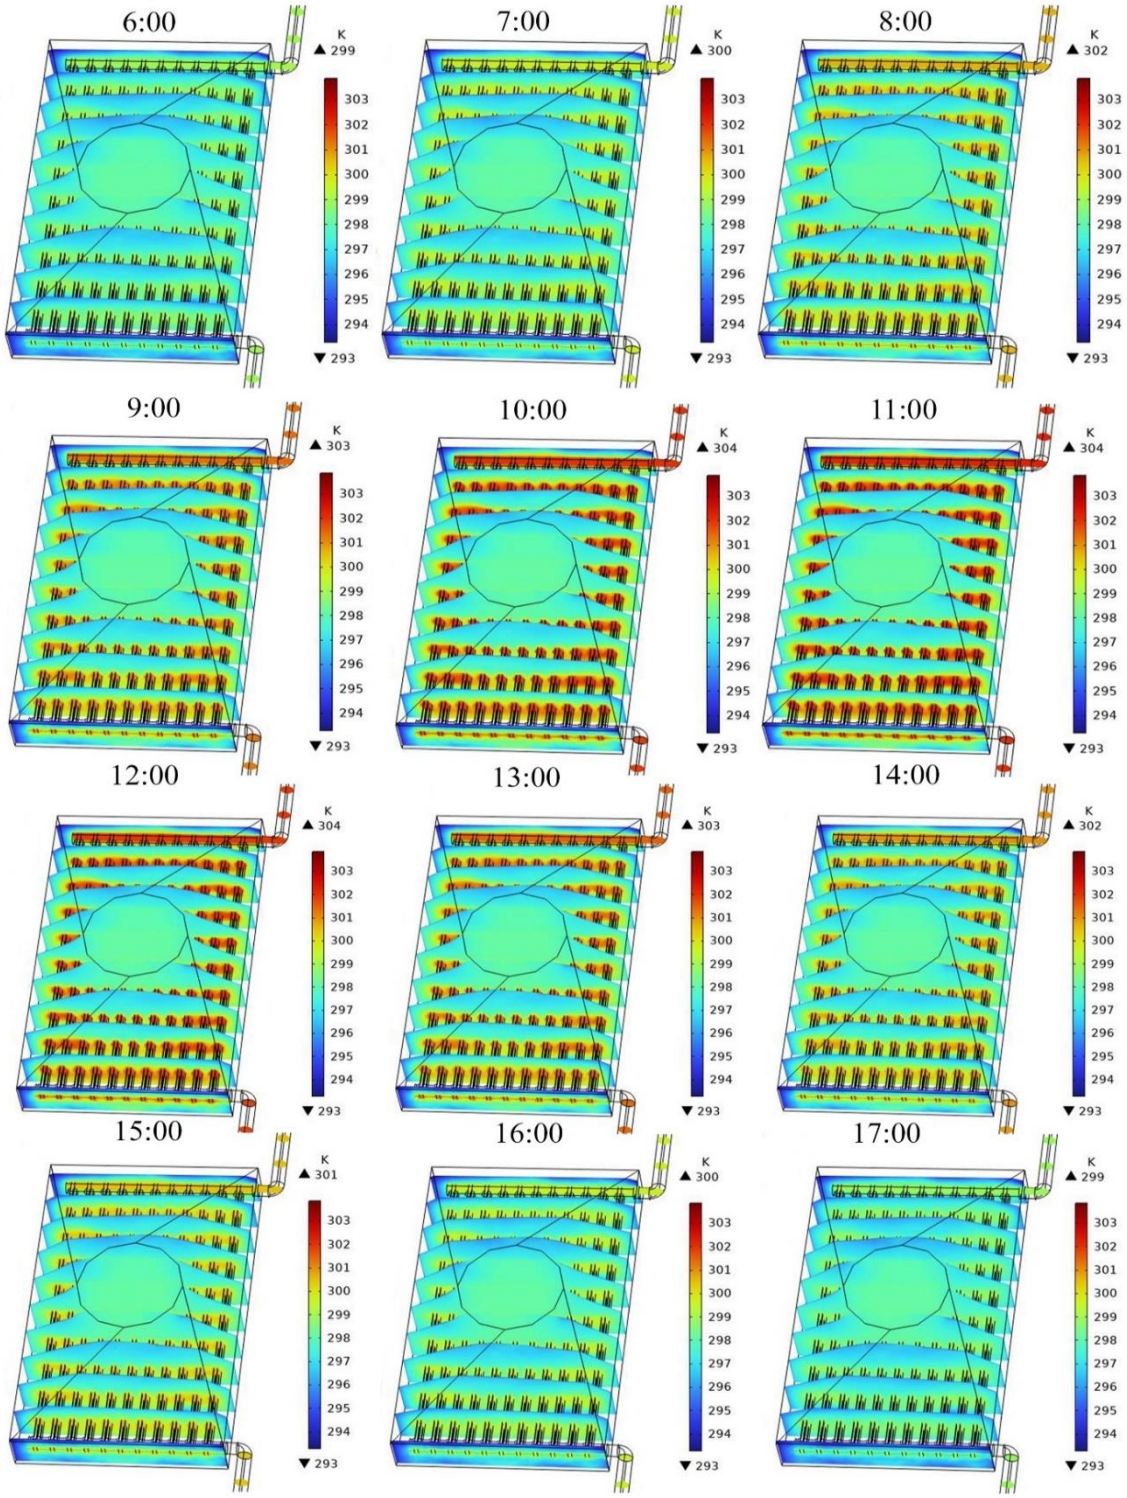

Figure 1. Temperature Variation in the Cooling System

The airflow exits from the center of the fan, spreads upward and sideways, and then moves downward, forming a circulating convection pattern within the system. These results demonstrate that the airflow in the cooling system is properly organized, and that the forced air circulation significantly enhances heat transfer through the radiator, thereby improving the overall cooling efficiency of the device.

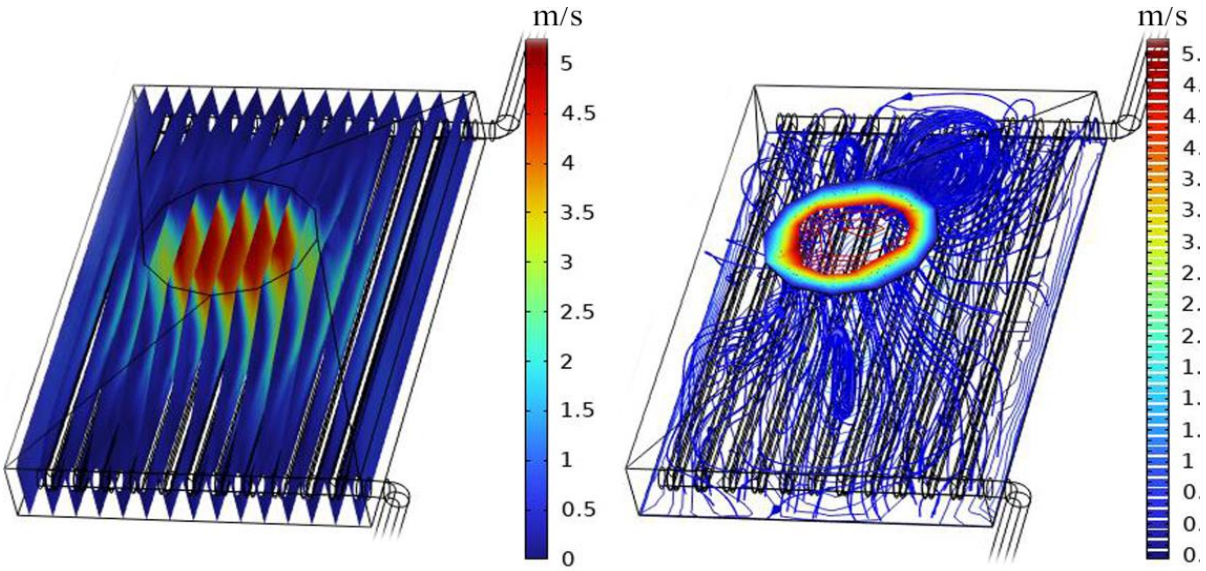

Figure 2. Airflow Velocity and Direction in the Cooling System

In Figures 1 and 2, the temporal variation of temperature along the radiator of the mobile solar energy device's cooling system is presented for three cross-sectional directions — Cut Line 1, Cut Line 2, and Cut Line 3. The graphs show that the temperature distribution along the radiator length is non-uniform, which is directly related to the airflow velocity, the inlet fluid temperature, and the intensity of solar radiation.

During the early morning hours (6:00–8:00), the radiator temperature remains relatively low, with an average value ranging from 298.2 K to 298.8 K. When solar radiation reaches its maximum between 11:00 and 14:00, a noticeable temperature rise is observed at the inlet section of the radiator, indicating the high heat absorption capacity of the working fluid.

Main part. The temperature graphs along Cut Line 1 and Cut Line 2 demonstrate that the heat flux is highest at the radiator's inlet section and gradually decreases toward the outlet. Along Cut Line 3, however, the temperature remains relatively stable with small amplitude variations, which indicates that the heat distribution inside the radiator becomes more uniform in this region.

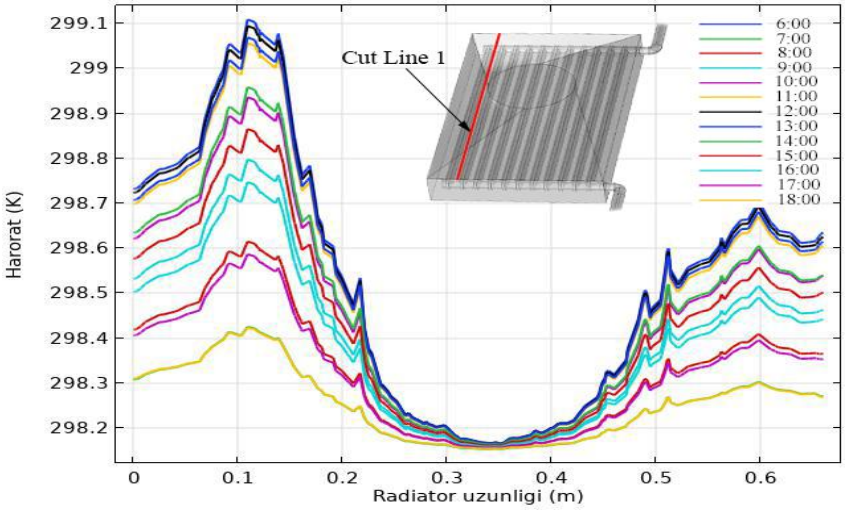

Figure 3. Temperature Variation along Cut Line 1 of the Cooling System

During the afternoon hours (15:00–17:00), as solar radiation decreases, the temperature drops, indicating that the fluid passing through the radiator is effectively cooled. The graphs clearly show

that the heat exchange process along the internal channels of the radiator remains stable, and the cooling process continues uninterrupted throughout the day due to the operation of the fan.

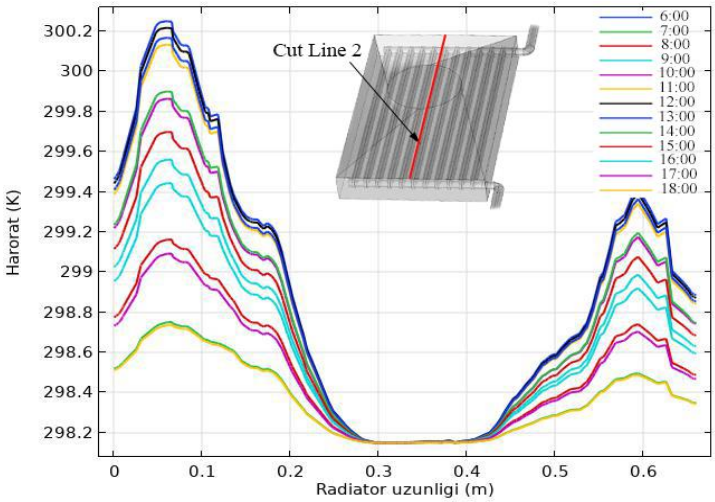

Figure 4. Temperature Variation along Cut Line 2 of the Cooling System

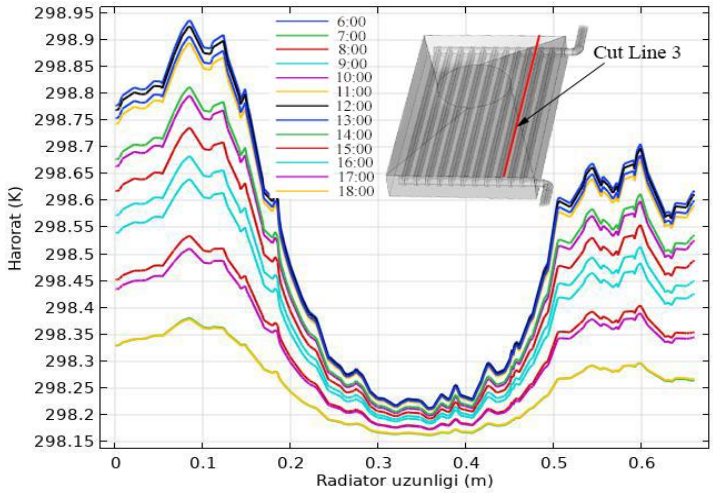

Figure 5. Temperature Variation along Cut Line 3 of the Cooling System

Figure 5 presents the graph of airflow velocity variation along the radiator length for Cut Line 1, Cut Line 2, and Cut Line 3 of the cooling system. The graph shows that the airflow velocity reaches its maximum value in the central region of the radiator, which corresponds to the forced convection flow generated by the fan.

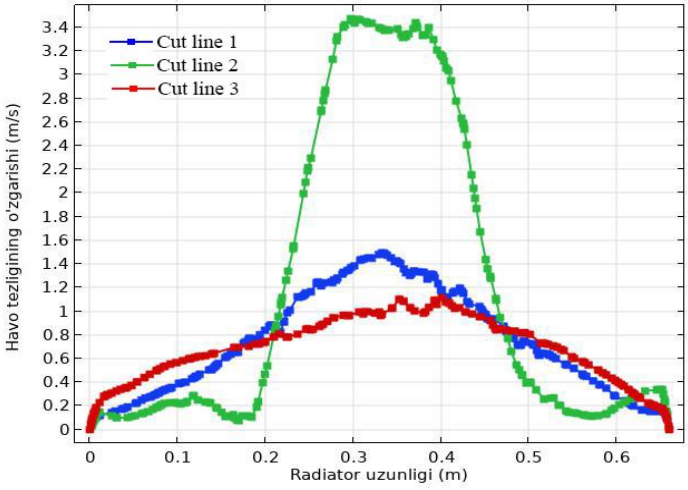

Figure 6. Airflow Velocity Variation along the Cut Lines of the Cooling System

Along the Cut Line 2 direction, the airflow velocity reaches its highest value — 3.2–3.4 m/s, which corresponds to the central flow zone of the fan. Along Cut Line 1, the velocity ranges from 2.0 to 2.4 m/s, while along Cut Line 3, it varies between 1.0 and 1.5 m/s, indicating weaker airflow in the outer regions of the radiator.

The sharp increase in airflow velocity in the central part of the radiator ensures an intensive heat transfer process due to forced convection. Moreover, for all three cross-sections, the airflow velocity reaches its maximum within the range of $0.1\ m < x < 0.5\ m$, which represents the most active cooling zone of the system.

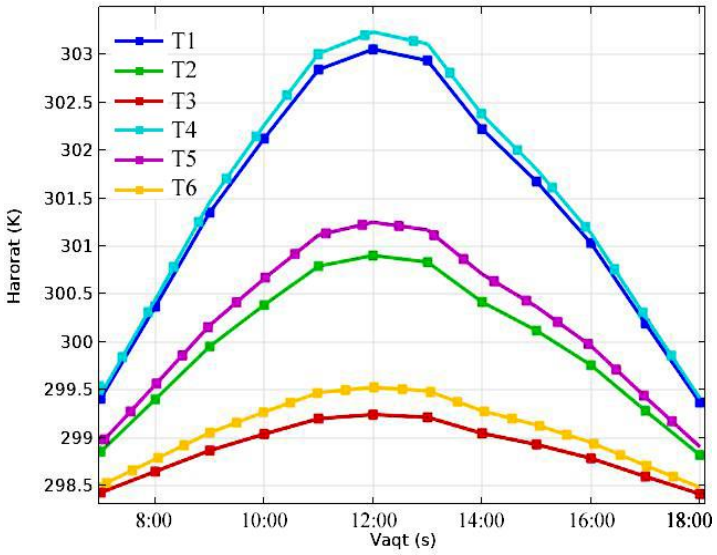

Figure 10. Temperature Variation at Points with T1–T6 Temperature Sensors in the Mobile Solar Energy Device

Figure 10 presents the graph of temperature variations over time (throughout the day) measured by temperature sensors T1–T6 located on the surface of the mobile solar energy device. As seen from the graph, with the increase in solar radiation intensity, the temperature values at all points rise and reach their maximum between 12:00 and 13:00. The T1 and T2 points are located in the upper part of the device, where the highest temperatures — around 303–304 K — are recorded. This indicates that these areas are most exposed to direct solar radiation. The T3 and T4 points are situated in the middle section, where temperatures range between 301–302 K. The T5 and T6 points correspond to the lower (shaded and cooled) region of the device, where temperatures are relatively lower — around 299–300 K. After 15:00, as solar irradiance decreases, the temperature at all points gradually declines, approaching the initial values by 17:00. These results indicate that there is a non-uniform vertical temperature distribution on the surface of the mobile device: the upper sections experience the highest heating due to direct sunlight, while the lower sections are maintained at lower temperatures under the influence of the cooling system.

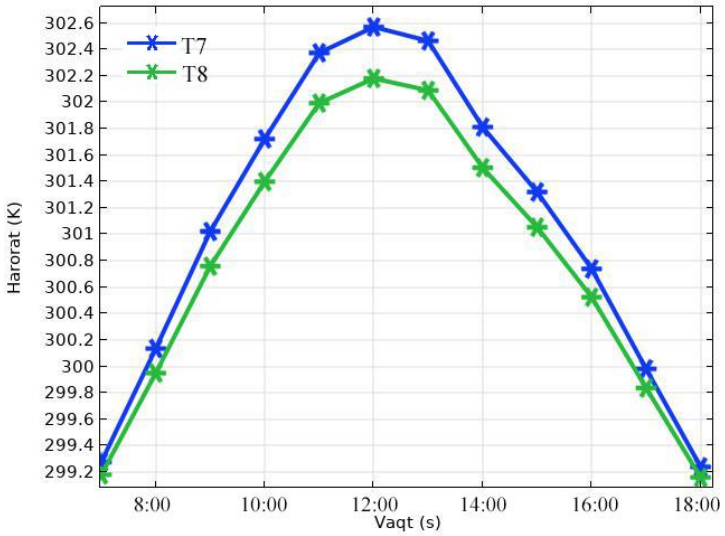

Figure 11. Temperature Variation at Points with T7 and T8 Sensors Located at the Inlet and Outlet of the Radiator

Figure 11 presents the graph of temperature variation over time measured by the T7 and T8 temperature sensors installed at the inlet and outlet points of the radiator. The calculations were performed at a volumetric flow rate of 0.1 m³/s.

As shown in the graph, during the early morning hours (8:00–10:00), the inlet fluid temperature ranges between 299.4–300 K, while the outlet temperature varies between 299.2–299.8 K. As solar radiation increases, the heat flow from the panel to the radiator intensifies, and between 12:00 and 13:00, the temperature reaches its maximum value. The temperature difference between the inlet and outlet ($\Delta T = T_7 - T_8$) is about 0.3–0.4 K, which indicates effective heat removal through the radiator.

After 14:00, as solar radiation decreases, the temperature gradually drops, and the system approaches a state of thermal equilibrium. At this stage, the inlet temperature T7 ≈ 302.3 K and the outlet temperature T8 ≈ 301.9 K. These results demonstrate that at a flow rate of 0.1 m³/s, the radiator consistently removes heat from the liquid while maintaining a stable cooling efficiency. The slightly lower outlet temperature confirms that the cooling system performs its function effectively.

Conclusion: The results of the computational study show that the cooling system of the autonomous photoelectric–thermal device effectively removes heat through the radiator and fan, maintaining both liquid and air temperatures within the normal operating range. Although the temperature distribution along the radiator is non-uniform—depending on solar radiation intensity and airflow velocity—the heat exchange process remains stable due to forced convection.

The small temperature difference between the inlet and outlet of the radiator confirms the high thermal efficiency of the system. Thus, the developed cooling system serves as an effective solution for reducing energy losses and improving the operational performance of mobile solar energy devices.

STATE OF THE TRANSPORT SERVICES MARKET OF THE REPUBLIC OF KARAKALPAKSTAN

Kutlumuratov Zh.Dj., Dawletnazarova B.
Karakalpak State University named after Berdakh
jumamuratqutlimuratov56@gmail.com
dawletnazarovab2@gmail.com

Summary: *This article discusses the application of optimal international directions and their types. Special attention is paid to the northern part of Uzbekistan and the Republic of Karakalpakstan. The results of the article highlight the importance of mathematical modeling in strategic supply chain management and provide useful information for optimizing traffic flows and reducing costs.*

Key words: *multimodal transportation, intermodal terminals, logistics optimization, transport logistics, cost analysis, mathematical forecasting, cost scaling*

Maintaining. Relevance and demand for the article. In the modern world, significant attention is being paid to reducing logistical costs for cargo handling, minimizing losses, optimizing the strengths of the transport system, and increasing the efficiency of transportation conditions to ensure the safety of cargo to its destination, as well as finding technical and technological solutions in the field of loading, unloading, and transport and warehouse operations. In this regard, the development and application of modern methods of cargo delivery, including the use of mixed transportation technologies, is of particular importance.

Research methodology. Today, about 3.6 thousand industrial enterprises operate in the Republic of Karakalpakstan, which is about 4% of the total number of operating enterprises in the country, which is only 98.8 thousand (see Figure 1).

This means that the Republic of Karakalpakstan contributes to the industrial sector of the country's economy, although its share in the total number of enterprises remains small due to insufficient infrastructure development.

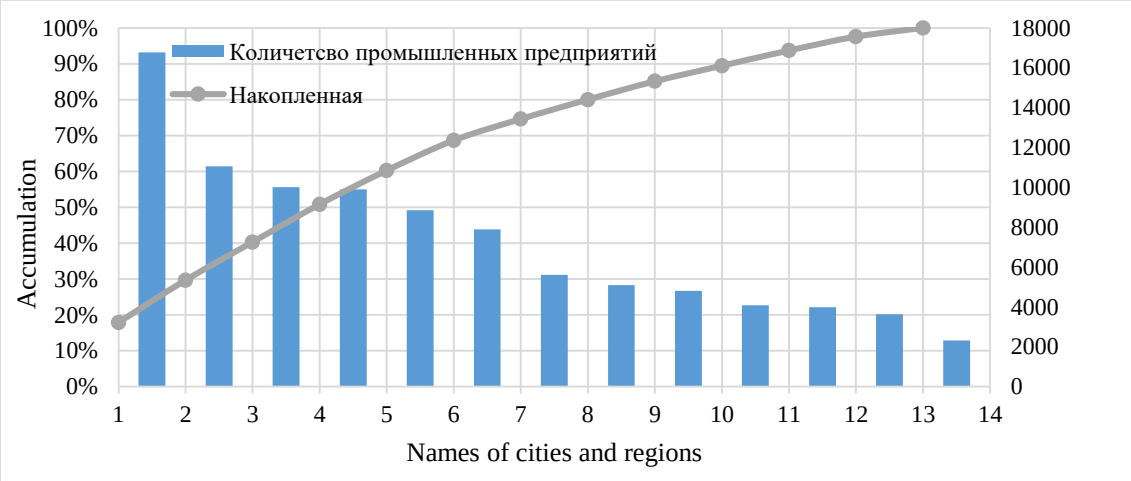

Figure 1.1. Number of industrial enterprises in the Republic of Uzbekistan

The growth of market services provided by road transport can be attributed to increased freight turnover, increased demand for logistics services, and passenger transportation. Automobile transport remains an important sector of the economy, ensuring the movement of goods and people both within the region and between different territories.

In January-March 2022, low volumes of agricultural, forestry, and fishery products (services) were observed in the Republic of Karakalpakstan, amounting to only 1,089.6 billion soums. Low production volumes in these sectors may indicate problems such as insufficient development of

transport infrastructure, unfavorable climate conditions, lack of modern technologies, or limited access to resources that Karakalpakstan is currently experiencing.

In January-March 2023, gross value added in the transportation and storage industry in the Republic of Karakalpakstan reached 460.2 billion soums. This represents an increase of 8.0% compared to January-March 2022. The growth of gross value added in the transportation and storage industry indicates the positive dynamics and development of this sector in the region. Increasing transportation volumes and improving storage services are important for the development of the economy, trade, and logistics.

The volume of transport services for January-June 2024 amounted to 58,935.9 billion soums, which is 6.5% more than in the same period of 2023. In the structure of transport services, the main share was occupied by road transport services, which accounted for 44.2% of the total volume of services. However, when analyzing the volume and growth of transport services by region, a negative trend was observed in the Republic of Karakalpakstan, where the decrease compared to the same period in 2023 was 0.9%.

The growth of gross value added in the transportation and storage sector reflects the positive development of this sector and its contribution to the economy of the Republic of Karakalpakstan. This can serve as an incentive for further investment, modernization, and development of this sector, which contributes to increased economic activity and the creation of new jobs in the region.

To further develop the transportation and storage sector in the Republic of Karakalpakstan, it is necessary to take the following measures:

1. The development of a network of roads, railways, and warehouses will contribute to improving the accessibility and efficiency of the transport system, which includes the construction of new facilities, reconstruction and modernization of existing ones, as well as the use of modern technologies and management systems.

2. Creation of logistics centers and warehouse complexes that contribute to optimizing the processes of storing and moving goods, improving the coordination and connection between different modes of transport. Such centers should ensure the consolidation of cargo, packaging, sorting, and tracking of cargo flows.

3. Improving the qualifications of transportation and storage workers, including drivers, logists, warehouse operators, and logistics planning specialists, contributes to increasing professional level and work efficiency. Training programs and trainings can be organized by both state and private institutions.

4. The application of modern information systems, automation of management and monitoring processes, and the use of geolocation and electronic document management systems will help reduce costs, increase the accuracy and reliability of cargo delivery, and improve logistics chain management.

5. Active participation in international projects and cooperation with neighboring countries in the development of transport infrastructure and the organization of international transport corridors should contribute to increasing the volume of transit cargo traffic and developing transit business.

6. Implementing environmentally friendly technologies and measures to reduce harmful emissions into the atmosphere, as well as developing and implementing energy-efficient solutions, will help reduce the impact of the transportation and storage sector on the environment and create favorable conditions for sustainable development..

Together, these measures will contribute to the further development of the transportation and storage sector in the Republic of Karakalpakstan, improving its competitiveness, expanding the geography of transport links, and attracting investments.

The image in Figure 1.2 shows Route 1: The Trans-Caspian route, which leads through Aktau/Kuryk to Baku and further involves transportation through several countries - Uzbekistan, Kazakhstan, Azerbaijan, Georgia, and Turkey, using land and sea routes.

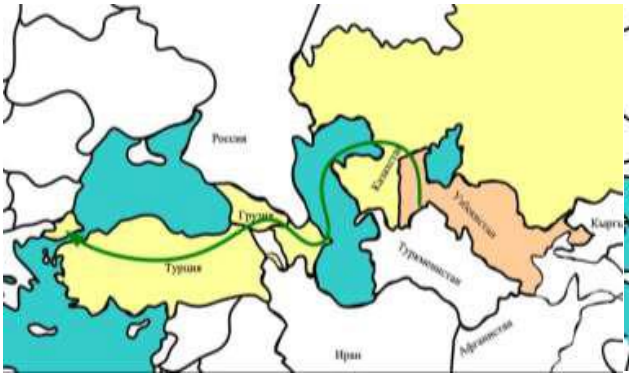

Fig. 1.2. Combined transportation along the route of Uzbekistan, Kazakhstan, Azerbaijan, Georgia, and Turkey.

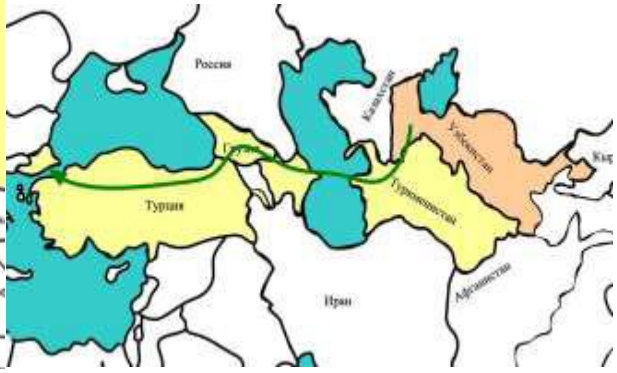

Fig. 1.3. Combined transportation along the route of Uzbekistan, Turkmenistan, Azerbaijan, Georgia, and Turkey.

Fig. 1.4. Combined transportation along the route of Uzbekistan, Kazakhstan, Russia, Georgia and Turkey.

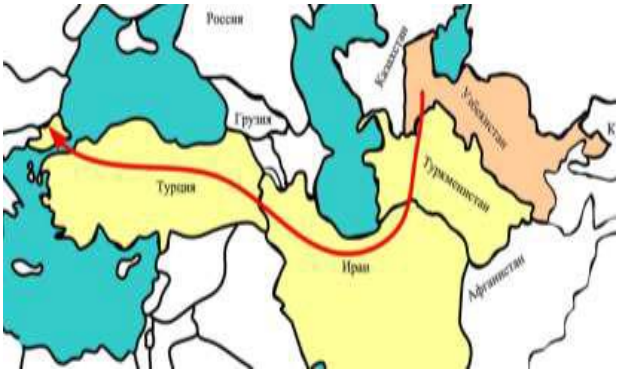

Fig. 1.5. Combined transportation along the route of Uzbekistan, Turkmenistan, Iran, and Turkey.

The advantage of this route is that using both land and sea transport can increase the flexibility and reliability of transportation. The route connects major economic centers, which contributes to the growth of trade and economic development of all involved countries. The route may offer alternative routes in case of political instability or other problems in traditional trade corridors.

Crossing many borders often leads to delays due to customs inspections and the need to comply with various regulations. As well as different tariffs and transportation costs at different sections of the route, which can complicate calculations and budget planning.

The freight route from Uzbekistan to Turkey covers a distance of 3,500 km and costs $2,900, of which $900 is the ferry crossing. The total travel time is 10.5 days, including an average wait time of 5.5 days, which indicates significant delays in travel. The time spent on undergoing procedures at checkpoints (CHPs) averages 1.4 hours. One of the route's hubs, Port

Kuryk is characterized as a complex CPP, which can affect the increase in waiting time and procedures. Such indicators as long waiting times and difficulty passing through checkpoints can significantly affect overall logistical efficiency and delivery times, making it important to consider possible measures to optimize these processes.

The image in Figure 1.3 shows Route 2: Trans-Caspian Route through Turkmenbashi to Baku. This route includes land and sea routes connecting Uzbekistan, Turkmenistan, Azerbaijan, Georgia, and Turkey.

The route includes various modes of transport, which improves the flexibility and stability of logistics chains. The passage through Turkmenistan optimizes cargo transportation from central and southern Uzbekistan, providing the shortest route to Azerbaijan. The route will also contribute to strengthening economic cooperation between the countries of the region.

The shortcomings include the route being subject to political and economic risks, especially in relations between Uzbekistan and Turkmenistan. The need to undergo multiple customs checks can cause delays and increase transportation costs.

The presented Figure 1.4 shows Route 3: a land route that passes through Uzbekistan, Kazakhstan, Russia, Georgia, and Turkey.

Land routes are often more predictable, as they are not susceptible to delays due to maritime weather conditions. Goods are transported from sender to receiver without overloading, which can potentially reduce delivery time and the risk of cargo damage. This route is integrated with rail and road systems, providing flexibility in choosing the transportation method.

However, this route carries unique political and economic risks that could affect the smooth operation of transport through Russia and Iran.

Karakalpakstan plays an important role as a transit zone between Uzbekistan and Kazakhstan. Considering its proximity to the Caspian Sea, Karakalpakstan uses it to organize cargo transportation to Kazakhstan's ports of Aktau and Kuryk, as well as to receive cargo arriving along this route from other countries. Karakalpakstan can also serve as a logistics and industrial hub, opening up opportunities to offer warehousing and transportation services, which are important for the effectiveness of the entire route.

Karakalpakstan plays a key role as a transit zone between Uzbekistan and Kazakhstan. Taking into account its proximity to the Caspian Sea, Karakalpakstan uses it to organize cargo transportation directed to Kazakhstan's ports of Aktau and Kuryk, as well as to receive cargo coming from other countries along this route. Also, Karakalpakstan can act as a logistics and industrial hub, offering warehousing and transportation services, which is important for the effectiveness of the entire route.

Karakalpakstan plays an important role in the transport corridor between Uzbekistan and Turkmenistan due to its strategic geographical location. It serves as a transit point for cargo coming from the eastern and central parts of Uzbekistan, and also serves to develop the transport and logistics infrastructure of the region, thereby improving the overall efficiency of the route. Considering its proximity to Turkmenistan, Karakalpakstan could facilitate access to the Turkmenbashi port for further maritime transportation to Azerbaijan.

Currently, combined transportation in Uzbekistan is mainly carried out using automobile and rail transport. However, these transportations are mainly carried out using wagon shipments, which is not a reliable scheme for delivering goods by rail. Figures 1.2 and 1.3 show the schemes of combined transportation, which include the following stages: first, the cargo is delivered by road transport to intermodal terminals, where overloading of the cargo occurs on rail transport. Then, freight data at railway stations and using sorting, section, and freight indicators are delivered to the next intermodal terminal.

However, despite the active use of combined transport in Uzbekistan, their current delivery scheme from automobile to rail transport may prove ineffective. Wagon-to-wagon communication has its limitations and does not always contribute to optimal cargo transportation. Possible problems with cargo transshipment, additional transportation costs, and extended delivery times.

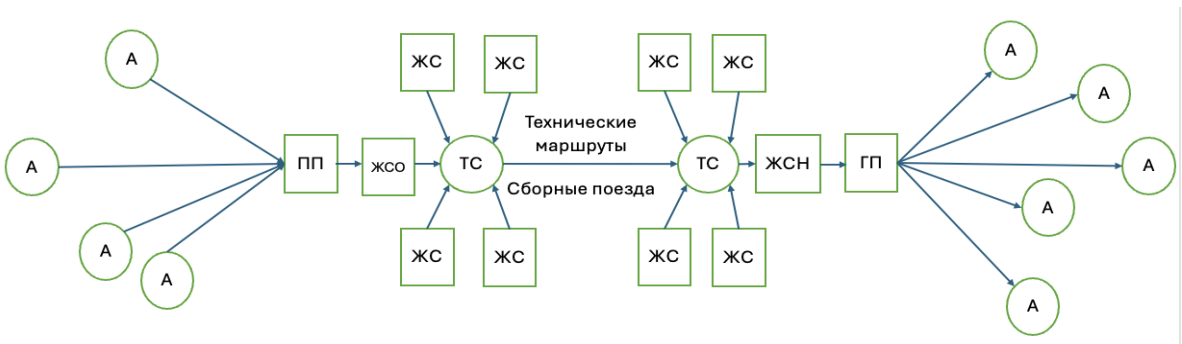

Figure 1.6. Existing logistics chain for cargo delivery from the Republic of Karakalpakstan

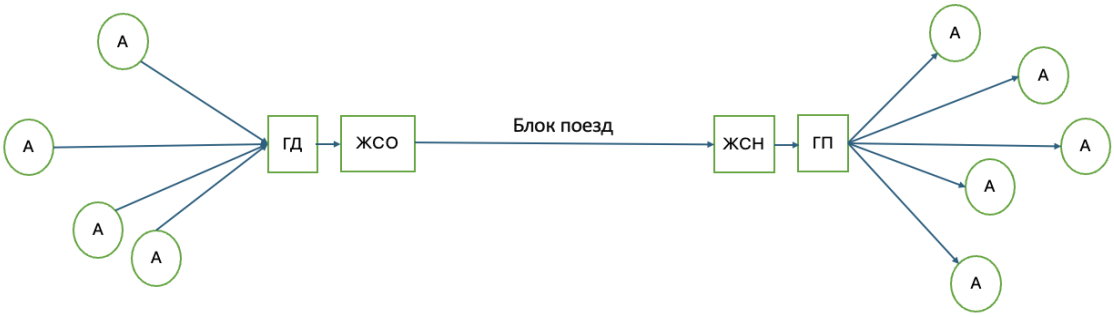

Figure 1.7. Proposed logistics chain for cargo delivery from the Republic of Karakalpakstan

Designations in Figure 1: A - delivery or distribution by motor transport, ACCS RD - access road, FY - freight yard or freight terminal; RSD - railway station of departure, RSD - railway station of destination; TS - technical station, RS - railway station.

As mentioned earlier, rail transport can be used for route shipments of cargo after transshipment from road transport. This technology relies on the principles of routing without disbandment and involves cooperation with profitable owner-operators as shown in Figure 1.7. However, this delivery method is primarily used for mass cargo, and the role of automobile transport is limited within large industrial systems.

Analyzing Figure 1.8, it can be observed that when delivering goods directly from manufacturers to consumers, it is necessary to develop 24 different delivery routes. However, when using an intermodal terminal, the number of these routes is reduced to 10. At first glance, it may seem that the introduction of an additional element in the supply chain, such as an intermodal terminal, will lead to an increase in the cost of delivering goods using combined transportation. However, this notion does not correspond to reality.

Intermodal terminals have the ability not only to transform the parameters of the cargo flow, but also to consolidate cargo, form it, and subsequently send it to other cargo terminals using rail or road transport depending on the volume of the transport batch. This allows for the effective optimization of cargo delivery and minimizes logistics costs. As a result of the use of intermodal terminals, significant simplification and reduction of delivery routes occur. This reduces cargo travel time and increases delivery speed. Additionally, intermodal terminals contribute to more efficient resource utilization and reduced environmental burden, as combining cargo allows for a reduction in the number of required vehicles and, consequently, a reduction in pollutant emissions.

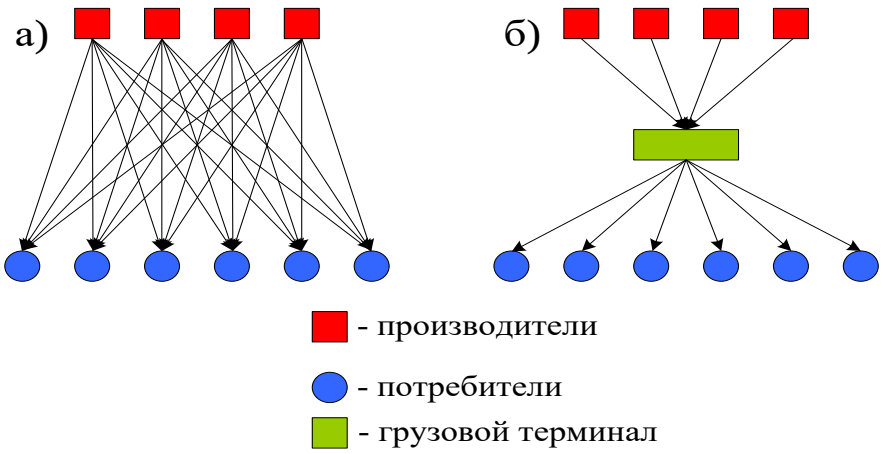

Fig. 1.8. Supply chain element: a - without terminal (24 routes), b - with intermodal terminal (10 routes)

Figure 1.8 further illustrates the operation of intermodal terminals, where the cargo flow is consolidated, formed, and sent to other cargo terminals using various modes of transport depending on the cargo volume. This confirms the possibility of optimization and flexibility provided by intermodal terminals within supply chains.

Thus, the presence of intermodal terminals leads to a significant reduction in the number of cargo delivery routes, improves the efficiency of logistics processes, and reduces costs. Intermodal terminals are an important component in optimizing and developing modern supply chains, allowing for more efficient and sustainable logistics.

In the context of combined transportation, the cargo delivery network can be organized in two different models, depending on the technology used. Let's examine them in more detail, referring to Figure 1.9.

a) Regional supply network. In this model, the supply network covers a specific regional area. Figure 1.9 (a) illustrates this concept. The cargo is collected from manufacturers in various locations of the region and delivered to intermodal terminals, where consolidation and the formation of cargo batches take place. These cargo shipments are then sent to other freight terminals using various modes of transport, such as rail or road transport. Upon arrival at the final cargo terminal, the cargo is distributed and delivered to the final consumers. Such a network organization allows for the optimization of cargo delivery within the region, reducing the number of direct routes and increasing the efficiency of logistics operations.

b) Main supply network: In the main supply network model shown in Figure 1.9 (b), cargo is collected from manufacturers in various territories and sent to intermodal terminals that play the role of central nodes in the network. Here, cargo batches are consolidated and formed, which are then sent to other intermodal terminals at longer distances using various modes of transport, such as rail or sea. After arriving at the final intermodal terminal, the cargo is distributed and delivered to the final consumers. The main supply network allows for the efficient organization of long-distance cargo delivery, reducing the required number of direct routes and optimizing the use of various modes of transport.

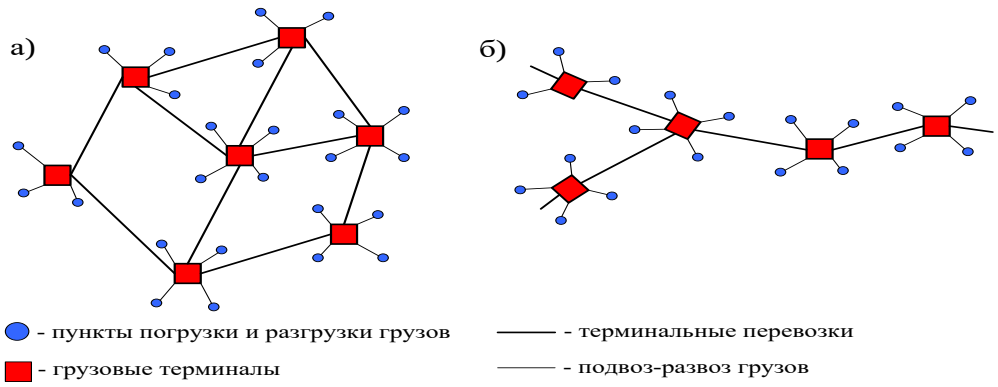

Fig. 1.9. Organization of cargo transportation in combined transport:
a - regional, b - main line

Both of these approaches to organizing the cargo delivery network using combined transportation have their advantages and are applied depending on regional characteristics and the requirements of logistics processes. They contribute to more efficient and sustainable logistics, minimizing costs and reducing negative environmental impacts.

However, despite the fact that combined transportation is an important element of modern logistics, there is potential for improving this system in Uzbekistan. For example, instead of using wagon shipments, we could develop more efficient methods for transporting goods by rail, such as container transportation or using specialized platforms for cargo transportation.

In addition, it is worth paying attention to the development of intermodal terminals and improving their infrastructure. Improvement of terminals will allow for more efficient transshipment

of goods from road transport to rail transport and vice versa, as well as faster and more reliable delivery of goods.

Thus, the presence of intermodal terminals is of great importance for modern supply chains. They allow for shortening delivery routes, reducing logistics costs, and increasing the efficiency of various types of cargo transportation. Intermodal terminals are a key element in the pursuit of optimizing and improving logistics systems in the modern world..

To optimize combined transportation, it is also necessary to pay attention to the coordination of the work of various structural units, such as railway stations, sorting and sectional stations, and freight stations. Only the interaction and coordinated work of these units will allow achieving an optimal cargo delivery scheme.

The development of combined transport in Uzbekistan requires the introduction of new methods and technologies, improvement of infrastructure, and enhancement of the coordination of various structural units. This will allow for more efficient and reliable cargo delivery, contributing to the development of the country's logistics system..

Conclusion: The scientific foundations of joint transport corridor schemes have been developed, in which the Republic of Karakalpakstan plays an important role as a transport hub for the concentration and distribution of cargo passing through the Trans-Caspian corridor. The developed schemes combine innovative approaches aimed at solving the problem of high costs and delivery times from Uzbekistan to Europe. As a result, opportunities are being created to increase the efficiency of logistics and economic integration between regions, and the foundations for sustainable trade and economic cooperation are being laid.

Summary. *Silicon heterojunction solar cells represent one of the most promising photovoltaic technologies for both terrestrial and space applications. In space, the photovoltaic performance of these devices is influenced not only by charged-particle irradiation but also by extreme temperature fluctuations. In this study, the temperature dependence and occurrence of S-shaped current–voltage characteristics were investigated in n-type heterojunction solar cells under AM0 illumination within the temperature range of 173–373 K. The experimental results revealed that at temperatures below 233 K, the current–voltage characteristics exhibited a pronounced S-shaped distortion near the open-circuit voltage, leading to significant reductions in both the fill factor and conversion efficiency. This anomaly was attributed to the valence band offset at the a-Si:H/c-Si heterointerface, which introduces a parasitic energy barrier for hole transport. As the temperature increases, thermally activated carriers are able to overcome this barrier, thereby reducing the S-shaped distortion and restoring near-ideal diode behavior above 233 K.*

Keywords: *heterojunction, AM0 spectrum, S-shaped current-voltage characteristics, low temperature, energy barrier.*

Introduction

In recent decades, solar energy has emerged as a highly promising, sustainable, and environmentally friendly sources for clean power generation [1]. Currently, various types of solar cells (SCs) - including polycrystalline and monocrystalline silicon (Si), cadmium telluride (CdTe), amorphous silicon (*a*-Si), copper indium gallium diselenide (CIGS) and copper zinc tin sulfide/selenide (CZTS) [2, 3], as well as perovskite and organic SCs [4, 5], are undergoing rapid development and achieving large-scale commercialization. To address the growing demand for lightweight and flexible electronic designs, so-called third-generation SCs, such as perovskite and organic devices, have attracted significant attention and are being extensively investigated in both industrial and laboratory environments [6].

In terms of conversion efficiency, these new-generation SCs typically achieve around 20-25% for a short period, which still lag behind the performance of Si-based SCs (25.6-27.8%), primarily due to challenges related to material quality and device architecture, which significantly limit their performance [7]. Furthermore, in terms of operational stability and device lifetime, perovskite and organic technologies perform considerably worse than their Si-based counterparts [8]. This aspect is particularly critical for applications where stability and long-term reliability are essential when SCs are deployed under diverse climatic conditions or extraterrestrial environments.

In recent years, among Si-based photovoltaic (PV) technologies, Si heterojunction (HJT) SCs, consisting of c-Si wafers passivated with intrinsic and doped hydrogenated amorphous silicon (*a*-Si:H) layers, have attracted considerable attention due to their outstanding surface passivation and high open-circuit voltages (up to 752 mV), with record conversion efficiencies (η) of 27.8% [7]. Moreover, HJT SCs exhibit a higher bifacial coefficient compared with other Si-based PV technologies. These advantages make HJT SCs highly suitable not only for terrestrial applications but also for demanding extraterrestrial environments, such as Low Earth Orbit (LEO, at an altitude of approximately 1500 – 2000 km above Earth's surface) [9].

The current-voltage characteristics (J-V curves) is one of the fundamental diagnostic tools for assessing the PV performance and elucidating the operational mechanisms of SCs [8]. Since J-V curves directly reflect the electrical behavior of SCs. Usually, ideal light J-V curves of SCs exhibit a rectangular shape, defined by high values of short-circuit current density (J_{sc}), open-circuit voltage (V_{oc}) and fill factor (FF), which together determine the overall η. However, under real operating conditions, SCs often exhibit non-ideal behaviors manifested as distortions in the J-V curve, which serve as critical indicators of performance-limiting loss mechanisms. Among these anomalies, the so-called S-shaped J-V curve is particularly detrimental, as it leads to a significant reduction in the FF and, consequently, the overall η [10]. The deviation of S-shaped J-V curves from ideal behavior is commonly associated with charge transport barriers at contact interfaces, mismatches in energy levels (band alignment) between the absorber layer and contact or interfacial defects, all of which create potential barriers that hinder efficient charge extraction, enhance non-radiative recombination, and suppressed photocurrent [10].

S-shaped J-V curves are frequently observed in various emerging PV technologies, including organic [11], perovskite [12], and thin-film SCs such as CdTe, *a*-Si and CIGS [10]. In the CdTe and CIGS SCs, S-shaped J-V curve associated with interface barriers at contacts, leading to "roll-over" effects in the J-V curves, while in organic and hybrid SCs, they are often attributed to charge transport barriers and energy level misalignments at interfaces [10]. In particular, in [13] reported the roll-over phenomenon in the J-V curves of thin film CdTe SCs, which originates from an energy barrier at the front contact. In these devices, at the interface between the CdS window layer and the fluorine-doped tin oxide (FTO) front electrode, two types of oxides, Al_2O_3 and SnO_2 were deposited as high-resistance transparent layers to improve electron transport and optimize band alignment. SnO_2 provides nearly barrier-free electron flow, thereby enhancing cell efficiency, whereas Al_2O_3 introduces a high energy barrier that negatively affects performance. Furthermore, with increasing Al_2O_3 layer thickness, the roll-over phenomenon in the J-V curves was observed to appear at progressively lower forward voltage values. Similar behavior can also occur in HJT SCs due to the complex electronic properties of their *a*-Si:H/c-Si and *a*-Si:H/transparent conductive oxide (TCO) interfaces [14].

Based on the above-mentioned, in this study, we investigate the temperature dependence and occurrence of S-shaped light J-V curves of HJT SCs fabricated on n-type Si wafers under AM0 spectrum in the temperature range of 173–373 K.

Material preparation and methods

Sample preparation

To perform study, HJT SCs (Fig. 1) were created on phosphorus-doped n-type Czochralski (Cz) grown c-Si wafers, with a donor concentration of $N_d \geq 10^{15}$ cm^{-3}, thickness of ~125 μm, crystallographic orientation (100) and initial bulk minority carrier lifetime of $\tau_{bulk} \geq 1$ ms.

Before deposition intrinsic and doped hydrogenated amorphous silicon (*a*-Si:H) layers on the n-type c-Si wafers to form heterojunctions, the wafers underwent a wet chemical cleaning procedure. After, to minimize incident light reflection from the wafer surfaces, and enhance photocurrent, the c-Si wafers were subjected to pyramidal surface texturing. Next, thin intrinsic *a*-Si:H layers (~5 nm thick) were deposited on both front and rear surfaces of the textured wafers using Very High Frequency Plasma-Enhanced Chemical Vapor Deposition (VHF PECVD) method. The primary function of the intrinsic *a*-Si:H thin layer **is to passivate dangling bonds on the c-Si wafer surfaces** through Si-H bond formation, thereby reducing interface defect states and improving carrier lifetime [15]. **Using the same method** to form $p-n$-junction, p-type *a*-Si:H layers (~10-15 nm thick) were deposited on the front side of the *i*-*a*-Si:H coated n-type c-Si wafers, and to create the back-surface field (BSF), n-type *a*-Si:H layers were deposited on the rear sides of *i*-*a*-Si:H deposited n-type c-Si wafers. **To obtain** p**- and** n**-type** *a*-Si:H **layers respectively, the monosilane (SiH_4) gas was diluted with (high-purity, 99.999%) diborane (**B_2H_6**) and phosphine (**PH_3**) gases. All** deposition processes **were performed at 180–185°C and a very high frequency of 40.68 MHz. Further, transparent conductive oxide (TCO) thin layers composed of indium tin oxide (ITO – 90 wt.% In_2O_3 and 10**

wt.% SnO_2) were deposited on the front and rear surfaces of the photosensitive heterostructures using Radio-Frequency (RF) magnetron sputtering. The deposited ITO thin layers facilitate efficient charge carrier transport and collection at the both electrodes. Furthermore, minimizing the thickness of the intrinsic and doped hydrogenated amorphous silicon (*a*-Si:H) layers, as well as TCO, is essential for reducing parasitic absorption losses within these layers [16].

To collect photogenerated charge carriers from the heterostructure surfaces, silver busbar-type contacts were screen-printed onto the both front and rear sides of the photosensitive heterostructures at low temperature (~50 ºC), followed by curing in air at ~200 ºC. The busbar contacts had a height of 25 µm, a width of 45 µm, and were patterned with a pitch of 1.36 mm. These parameters were measured using a KLA/Tencor Alpha-Step D-120 profilometer. A schematic view of the *n*-type HJT SCs is shown in Fig. 1.

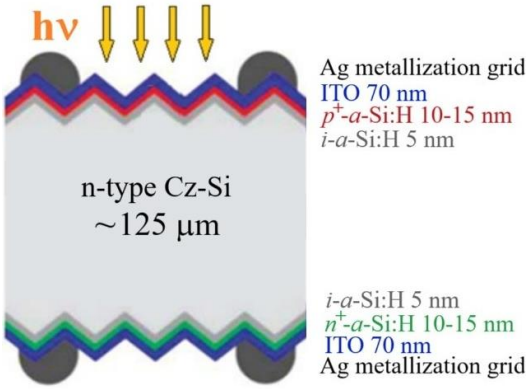

Fig. 1. A cross-sectional view of the finished *n*-type HJT SCs.

To perform experiment, *n*-type c-Si samples with an area of 1 × 1 cm^2 were cut from high-efficiency *n*-type HJT SCs with full-area dimensions of 15.6 × 15.6 cm^2. No additional passivation was applied to the lateral surfaces, and edge isolation was not performed. The cutting process was carried out using a solid-state "MiniMaker2" diode laser with a wavelength of 1064 nm. **During laser scribing, the laser parameters were set as follows: a scribing speed of 200 mm/s, a pulse repetition rate of 20 kHz, and a pulse duration of 10 ns. The scribing process was carried out on the rear side of the *p-n*-junction.**

Characterization and measurement of performances

To investigate the temperature dependence and the occurrence of S-shaped light J-V curves in *n*-type HJT SCs, light **J-V curves** were measured using a liquid nitrogen cryostat (Janis VPF-100) over the temperature range of 173–373 K, in 20 K increments. **During the measurements, the samples were illuminated with** a **class AAA pulsed solar simulator (SS-80AA simulator) under AM0 spectrum (136.7 mW/cm^2). The J_{SC} and V_{OC} were recorded** using a **Keithley SM2460 Source Meter. Temperature stabilization was achieved** with a liquid nitrogen cryostat equipped with **a Lake Shore Model 335 temperature controller**. **Each light J-V curve was measured only** after the target temperature had been reached and **maintained for 4-5 minutes** under AM0 spectrum (136.7 mW/cm^2).

For this study, about 20 *n*-type HJT SCs samples were fabricated, all exhibiting similar parameters within a margin of error below 2%. From these, three representative samples with an active area of 1x1 cm^2 were selected for temperature-dependence measurements, and their results are presented in this study.

Results and discussion

To investigate the temperature dependence and observation of *S*-shaped light J-V curves **in HJT SCs fabricated on *n*-type c-Si wafers, light J-V curves were measured under AM0 spectrum (136.7 mW/cm²) in the temperature range of 173–373 K (Fig. 2). As shown in Fig. 2, the ambient temperature has a strong influence on the shape of the light J-V curves of *n*-type HJT SCs. Specially, the J_{SC} increases slightly with rising temperature, whereas the V_{OC} exhibits**

a clear decreasing trend. The experimental results demonstrate that at low temperatures, particularly below 233 K the illuminated J-V curves of n-type HJT SCs deviate significantly from their conventional diode-like behavior, exhibiting a pronounced S-shaped distortion near V_{OC}, as illustrated in Fig. 2. With increasing temperature, this S-shaped behavior in the illuminated J-V curves gradually disappears in the vicinity **of V_{OC}. Similar behavior has also been reported in studies: in [17], experimental investigations of the temperature dependence of J-V curves revealed the emergence of S-shaped behavior at temperatures well below room temperature, while in [18], the disappearance of S-shaped behavior with increasing temperature was also observed. It is well established that the appearance of S-shaped behavior in light J-V curves at low temperatures leads to a significant reduction in both the FF and η of HJT SCs. This effect is primarily** attributed to charge transport barrier at the heterointerfaces, which, in turn, increase the series resistance (R_s) of SCs [10].

In [10], influence of series (R_s) and short (R_{sh}) resistances on the light J-V curves of SCs was investigated. However, the study emphasizes that simple model with constant R_s and R_{sh} cannot explain the occurrence of S-shaped J-V curves. Instead, more advanced approaches are required that incorporate interfacial energy barriers and Fermi-level misalignment [10, 19]. A high R_s mainly tilts the J-V curve at position of the V_{oc}, while a low R_{sh} reduces the flatness of the curve at the position of J_{sc}. Both high R_s and low R_{sh} lead to a reduction in the FF, and consequently, a decrease in the η of SCs. The R_s arises from high-resistivity absorber materials connected in series (vertical resistivity) and resistive losses in the grid contacts (lateral resistivity). Conversely, the R_{sh} characterizes current leakage pathways, including those through pin holes, surface recombination currents, bulk defect-assisted tunneling, and peripheral leakage at device edges [10].

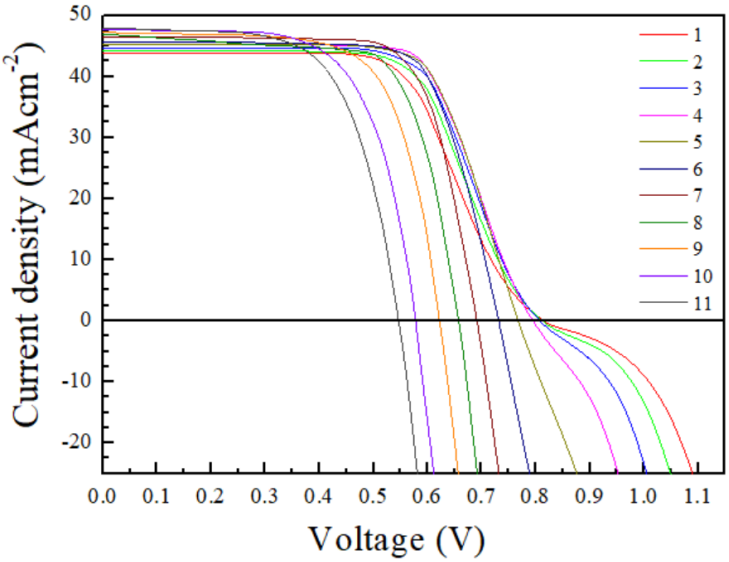

Fig. 2. Light J-V curves of HJT SCs based on n-type c-Si wafers under AM0 spectrum (136.7 mW/cm^2) in the temperature range of 173–373 K. T, K: 1 – 173, 2 – 193, 3 – 213, 4 – 233, 5 – 253, 6 – 273, 7 – 293, 8 – 313, 9 – 333, 10 – 353, 11 – 373.

To investigate the origin of the S-shaped behavior observed in the light J-V curves of the n-type HJT SCs at low temperatures (T<233 K), an energy band diagram was constructed (Fig. 3). In the **n-type** HJT SCs, the main potential barrier responsible for the separation of photogenerated charge carriers in the base and emitter regions under the electromagnetic illumination is formed at the **(p^+)*a*-Si:H/(n)c-Si-**heterojunction. Therefore, this part of the heterostructure is illustrated in the corresponding energy band diagram **(Fig. 3)**. **The energy band diagram was constructed based on the Anderson model under thermal equilibrium conditions at room temperature. The conduction band (ΔE_c) and valence band (ΔE_V) offsets at the *a*-Si:H/c-Si heterointerface were**

calculated using the Anderson model. These values were found to be approximately 0.15 eV and 0.45 eV, respectively. The calculations were performed using electron affinity values of 4.05 eV for c-Si and 3.9 eV for *a*-Si:H [20]. The ΔE_V was calculated using the following equation,

$$\Delta E_V = (E_{g1} - E_{g2}) - \Delta E_c, \quad (1)$$

where, E_{g1} =1.72 eV **and** E_{g2} =1.12 eV represent **the bandgaps of *a*-Si:H and c-Si, respectively, at room temperature** [20]. Also, the band gap of thin ***a*-Si:H layers was determined using Tauc's method, derived from the spectral dependence of** $(\alpha h\nu)^{1/2}$ on $h\nu$**.**

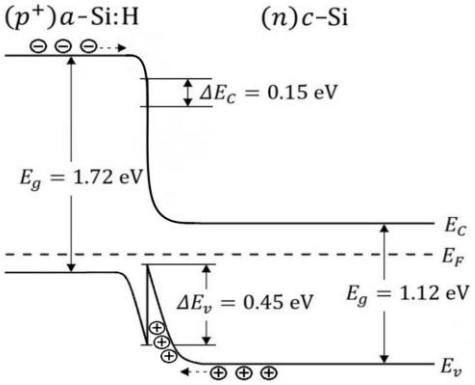

Fig. 3. Energy band diagrams of HJT SCs based on *n*-type c-Si wafers, illustrated at room temperature. In the band diagram, holes are denoted by a circled plus symbol (⊕), while electrons are indicated by a circled minus symbol (⊖) for clarity.

As described by equation (1), the ΔE_V is determined by the bandgap difference between the two contacting semiconductors and the ΔE_c. In our case, E_{g1} for ***a*-Si:H and** E_{g2} for c-Si, respectively. Since the bandgaps of both semiconductors exhibit temperature dependence, the ΔE_V consequently varies with temperature. For the investigated heterostructure, ΔE_V=0.45 eV at room temperature, but this value increases at lower temperatures due to the enhanced bandgap difference $(E_{g1} - E_{g2})$ [21]. According to [22], for achieving the highest values of V_{OC} and FF**,** the optimal ΔE_V should be 0.45 eV at room temperature, as this band offset minimizes carrier recombination at the ***a*-Si:H/c-Si** heterointerface.

First, let us consider the fundamental physical processes occurring in HJT SCs fabricated on n**-type c-Si wafers through analysis of their energy band diagram (Fig. 3)**. **It is well known that under illumination, electron-hole pairs generated in the** n**-base of the HJT SCs are separated by the built-in electric field of the** p^+-n**-heterojunction. Photogenerated holes (minority charge carriers in** n**-type c-Si wafer, which denoted by** a circled plus symbol - ⊕**) inject into the** p^+**-region (emitter) under built-in electric field (Fig. 3). In this case, as illustrated in Fig. 3, holes experience a spike that acts as an energy barrier to hole transport [14]. To contribute to charge transport, holes must overcome the barrier of** ΔE_V=0.45 eV, which arises at the p^+-n**-heterojunction due to the mismatch in valence band alignment between the two types of semiconductors (*a*-Si:H and** c-Si**) brought into contact. As temperature decreases, the** ΔE_V increases, **the spike - barrier impedes hole transport, reducing the fraction of holes that overcome the potential barrier. Consequently, holes accumulate near the front (**p^+**) *a*-Si:H/(**n**) c-Si-heterojunction, inducing the** S**-shaped behavior in the light J-V curves at cryogenic temperatures (Fig. 3)** [19, 21]. Thus, at low temperatures, the R_s increases, leading to a reduction in the FF due to the temperature-dependent shift in the energy barrier (ΔE_V). This effect causes a pronounced displacement of the maximum power point toward lower voltages, characteristic of S-shaped light J-V curves [18].

Our experimental results demonstrate that the S-shaped behavior in the J-V curves of n-type HJT SCs predominantly appears at significantly low temperatures (T<233), whereas, at room temperature and above, the S-shaped anomaly is no longer observed, indicating that the underlying transport limitations are effectively suppressed. In n-type HJT SCs, with increasing temperature, the additional thermal energy facilitates charge carrier transport across interfacial barriers, thereby mitigating the severity of the S-shape. As a result, the J-V curves progressively resemble the ideal diode behavior, exhibiting smoother characteristics and higher FF. This phenomenon has also been confirmed in [13], where it was shown that the occurrence of S-shaped distortions in the J-V curves strongly depends on the thickness of the passivating layer. Specifically, as the layer thickness increases, the likelihood of S-shaped behavior becomes more pronounced. Conversely, employing an ultrathin, high-quality, and highly conductive intrinsic *a*-Si:H layer not only maximizes surface passivation of the c-Si wafer, thereby improving V_{oc} and J_{sc}, but also enhances charge transport properties, resulting in higher FF values.

In [14], however, S-shaped J-V curves of Interdigitated Back Contact Silicon Heterojunction (IBC-SHJ) SCs were observed even at room temperature. According to that study the origin of the S-shaped behavior was attributed to carrier recombination induced by interface defects, the formation of a strong inversion layer at the surface, and pronounced valence band offsets that introduce energy barriers for minority carriers at the heterointerface.

According to the results reported in [23], the disappearance of the S-shaped behavior in the light J-V curves near V_{OC} is attributed to a reduction in the potential barrier due to increased doping levels in the base or emitter layer. As a result, in addition to thermionic emission, carriers can drift through a spike barrier by tunneling (trap-assisted tunneling). With higher doping concentrations, the space charge region (SCR) becomes narrower, leading to an increase in the tunneling current [23].

Capacitance-voltage (C-V) measurements conducted at 100 kHz and 300 K using a Semetrol LLC instrument reveal the width of the SCR of ~0.422 μm in the n-type HJT SCs. At reduced temperatures, this configuration prevents hole tunneling between the n-base and p^+-emitter regions. Consequently, the observed S-shaped behavior in the light J-V curves at lower temperatures is attributed to a parasitic potential barrier caused by the ΔE_{V}.

To investigate the influence of the S-shaped behavior on the FF and conversion efficiency (η) of n-type HJT SCs, the temperature-dependent variation of these parameters was extracted from the illuminated J-V curves. Fig. 4 presents experimental results of the temperature dependence of the FF (*a*) and R_s (*b*) of HJT SCs based on n-type c-Si wafers under AM0 spectrum (136.7 mW/cm^2). The FF is defined by the following expression [23]:

$$FF = \frac{J_m V_m}{J_{sc} V_{oc}}, \tag{2}$$

where, J_m and V_m – current density and voltage at maximum power point.

As shown in Fig. 4 *a*), the FF of the HJT SCs based on n-type c-Si increases linearly from 65% to a peak value of about 75% as the temperature rises from 173 K to 273 K. However, beyond 273 K, the FF decreases linearly, reaching 65.53% at 373 K. The initial increase in FF with rising temperature is attributed decreasing of parasitic potential barrier caused by the ΔE_V (Fig. 3), R_s and enhanced charge carrier transport in the SCs (Fig. 4 *b*).

The decrease in R_s is particularly pronounced in the low-temperature region, where its value decreases from ~13.8 Ω·cm² at 173 K to ~2.5 Ω·cm² at 273 K with rising temperature (Fig. 4 *b*). Within this temperature interval, R_s decreases at a relatively high rate of -0.817%/K, indicating enhanced carrier transport due to reduced resistive losses. This value is in good agreement with the data reported in [24]. In the higher temperature range of 273–373 K, R_s exhibits a slight decrease (-0.41%/K) from ~2.5 Ω·cm² at 273 K to ~1.3 Ω·cm² at 373 K. In the temperature range of 173–273 K, the shunt resistance (R_{sh}) exhibits only minor variations.

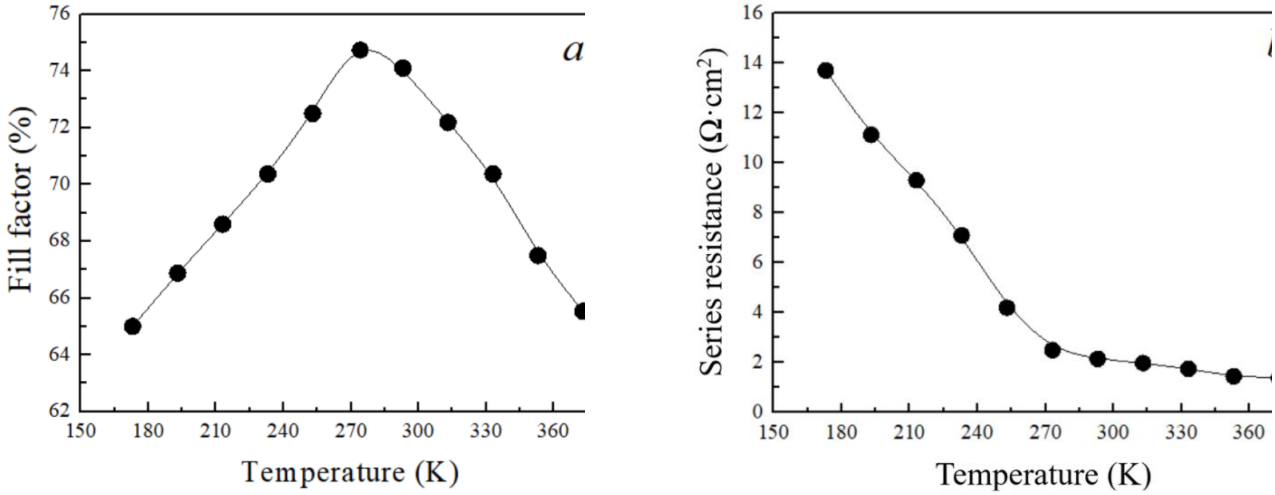

Fig. 4. Temperature dependence of the fill factor (*a*) and series resistance (*b*) of HJT SCs based on n-type c-Si wafers under AM0 spectrum (136.7 mW/cm^2).

The decline in FF of n-type c-Si HJT SCs at higher temperatures is most likely attributed to a decrease in R_{sh}, which is connected in parallel with the $p-n$-junction and consists of parasitic leakage paths that lead to increased current losses and reduced the maximum output power of the PV device.

Furthermore, as described by Eq. (2), FF is influenced by the V_{OC}, which usually exhibits a linear decrease with rising temperature. The temperature coefficient of the fill factor ($TCFF$), determined from the slope of the linear decline in FF, was determined to be -0.14%/K for n-type c-Si HJT SCs in the temperature range of 273–373 K.

Fig. 5 shows the temperature dependence of the conversion efficiency $\eta(T)$ of the HJT SCs based on n-type c-Si wafers under 136.7 mW/cm^2. η of the HJT SCs is defined as the ratio of the P_{max} to the incident light power (P_{rad}), which is expressed by the following equation [23]:

$$\eta = \frac{P_{max}}{P_{rad}} \cdot 100\% = \frac{J_{sc}V_{oc}FF}{P_{rad}} \cdot 100\%, \quad (3)$$

where, P_{rad}=136.7 mW/cm^2.

As shown in Fig. 5, the η of n-type c-Si HJT SCs decreases linearly from ~18.4% to ~12.7% as the temperature increases from 273 K to 373 K. When cooling from 273 K to 173 K, η initially exhibits a slight increase, reaching a peak of ~18.55% at 233 K, followed by a linear decline to ~17.1%. This behavior is primarily governed by the temperature dependence of the semiconductor's intrinsic properties and the key PV parameters of SCs, namely V_{OC}, FF, R_{sh} and R_s, which collectively exert the significant influence on the $\eta(T)$ characteristics. In the 173–273 K range, J_{sc} shows only a minor decrease, while V_{oc} increases slightly with decreasing temperature (see Fig. 2). At temperatures above 273 K, the linear degradation of η is primarily driven by significant reductions in both V_{oc} and FF, which are adversely affected by thermally activated carrier recombination and resistive effects.

The temperature coefficients of the η ($TC\eta$) for n-type c-Si HJT SCs were determined to be -0.31%/K in the 273–373 K range and -0.15%/K in the 173–233 K range. The relatively low $TC\eta$ of HJT SCs, compared with other Si-based PV technologies can be attributed to the presence of *i*-*a*-Si:H passivation layers on both surfaces of the c-Si wafer. This structure reduces TCV_{OC}, which accounts for more than 60% of the overall variation in the power temperature coefficient, thereby playing a dominant role compared to other PV parameters such as J_{sc} and FF [24].

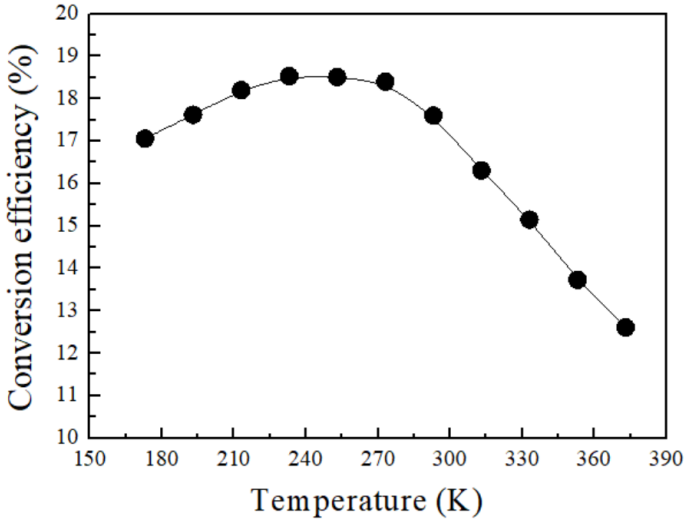

Fig. 5. Temperature dependence of the conversion efficiency of HJT SCs based on n-type c-Si wafers under AM0 spectrum (136.7 mW/cm^2).

It should be noted that the η of SCs under AM0 conditions is lower than under AM1.5G. This is primarily because AM0 lacks atmospheric absorption, leading to a higher contribution of ultraviolet (UV) and infrared (IR) radiation, which are less effectively converted into electricity [25]. The η of n-type HJT SCs at room temperature was determined to be 17.5% under AM0 spectrum and 19.25% under AM 1.5G spectrum, respectively, after laser cutting.

Conclusion

In this study, the temperature dependence of the PV performance and the occurrence of S-shaped J-V curves in n-type Si-based HJT SCs were systematically investigated under AM0 spectrum in the temperature range of 173–373 K. The experimental results revealed that at temperatures below 233 K, the J-V curves exhibit a pronounced S-shaped distortion, leading to substantial reductions in FF and η. This anomalous behavior is attributed to the valence band offset at the a-Si:H/c-Si heterointerface, which introduces a parasitic energy barrier for hole transport. With increasing temperature, thermal activation enables charge carriers to overcome this barrier, restoring near-ideal diode behavior above 233 K. An increase in the series resistance at low temperatures was also clearly identified from the light J–V curves. This behavior indicates that the efficiency of the solar cells decreases significantly under low-temperature conditions.

Rezyume: *Kremniy asosidagi geterotuzulmali quyosh elementlari Yer sirti hamda kosmosda qo‘llaniladigan eng istiqbolli fotovoltaik texnologiyalardan biri hisoblanadi. Kosmik sharoitlarda ushbu qurilmalarning fotoelektrik xususiyatlariga nafaqat zaryadlangan zarrachalarning nurlanishi, balki haroratning keng diapozonida o’zgarishlari ham ta’sir ko‘rsatadi. Ushbu tadqiqotda, 173–373 K harorat oralig'ida, AM0 yoritilish spekrtida n-tipdagi kremniy asosidagi geteroo’tishli quyosh elementlarining haroratga bog'liqlik va S-shaklidagi volt-amper tasniflarining paydo bo'lishi o'rganildi. Tajriba natijalari shuni ko'rsatdiki, 233 K dan past haroratlarda salt-yurish kuchlanishi sohasida volt-amper tasnifning S-shaklli xususiyati namoyon bo’ladi, bu esa quyosh elementining to‘ldirish koeffitsienti va samaradorligining sezilarli darajada pasayishiga olib keladi. Ushbu anomaliya a-Si:H/c-Si geterochegarasida valent sohaning siljishi bilan bog'liq bo'lib, bu kovaklar transporti uchun energetik to'siq hosil qiladi. Harorat ortishi bilan issiqlik faollashuvi hisobiga*

zaryad tashuvchilar ushbu to‘siqni yenga oladi, natijada volt-amper tasnifdagi S-shaklli xususiyat susayadi va 233 K dan yuqori haroratlarda quyosh elementining xususiyati ideal diodning volt-amper tasnifiga yaqinlashadi.

Резюме: *Кремниевые гетеропереходные солнечные элементы являются одной из наиболее перспективных фотовольтаических технологий как для наземных, так и для космических применений. В космических условиях на фотоэлектрические характеристики этих устройств влияет не только облучение заряженными частицами, но и экстремальные колебания температуры. В данной работе исследованы температурная зависимость и возникновение S-образных вольт–амперных характеристик (ВАХ) гетеропереходных солнечных элементов на основе n-типа кремния при освещении спектром AM0 в диапазоне температур 173–373 K. Экспериментальные результаты показали, что при температурах ниже 233 K ВАХ проявляют выраженное S-образное поведение в области напряжения холостого хода, что приводит к значительному снижению как коэффициента заполнения, так и КПД преобразования. Эта аномалия обусловлена смещением валентной зоны на гетерогранице a-Si:H/c-Si, вызывающим появление паразитного энергетического барьера для транспорта дырок. С повышением температуры за счёт тепловой активации носители заряда способны преодолевать данный барьер, что приводит к ослаблению S-образной деформации ВАХ и восстановлению близкого к идеальному диодному поведению при температурах выше 233 K.*

Kalit so‘zlar: *geteroo’tish, AM0 spektr, S-shaklli volt-amper tasniflar, past harorat, energetik to‘siq.*

Ключевые слова: *гетеропереход, спектр AM0, S-образные вольт–амперные характеристики, низкая температура, энергетический барьер.*

FEATURES OF THE CONSTRUCTION OF WIND GENERATOR STATIONS

Adilbaev I.B., Bekbauliev R.I., Abdireymova A.G.
Karakalpak State University named after Berdakh

Summary: *The work examines wind turbines with vertical and horizontal rotation axes, their operating principle, features, advantages, and disadvantages. Also, considering a synchronous generator with permanent magnets as an electrical machine is of particular importance.*

Key words: *unit, asynchronous motor vertical axis, wind turbines, generator, horizontal axis, power, motor, inverter, short circuit, magnet, rotor, synchronous generator, rotational speed, braking system, weather vane.*

Every year, with the increase in the number of industrial and residential areas, the need for electricity is increasing. And this issue is especially acute in hard-to-reach regions, as well as in regions with an unstable political situation. The construction of thermal power plants or hydroelectric power stations in such areas will lead to capital expenditures, which will be irrational for a number of reasons: the absence of rivers, the lack of developed infrastructure for fuel supply routes, and the low population density of the region.

A simple solution to this problem is the installation of a wind power plant (WPS). This is especially true in regions with stable wind flow throughout the year. [1]

Recently, there has been an intensive increase in wind energy. Wind generators are divided into generators with vertical and horizontal rotation axes.

Wind turbines with a horizontal axis of rotation consist of three blades, a hub, rotating bearings, and drive mechanisms that change the blade angle. The aerodynamic brake is created by the blades themselves, which can rotate perpendicular to the turbine's rotation plane. The blades are equipped with a lightning protection system consisting of a metal receiver that transmits lightning energy to the hub. The driving mechanical circuit consists of the rotor shaft, a transmission connected to the generator via a movable clutch, and a flexible crank. The transmission can be made in the form of a two-stage planetary transmission, a viscous coupling, or another reducer.

Cooling is carried out along two cooling circuits. Bearings are constantly lubricated by spraying. The temperature of the bearings and oil is constantly monitored. An asynchronous or synchronous machine is used as a generator. The optimal temperature of the generator is maintained by the water-glycol cooling circuit. The role of the aerodynamic brake is performed by the blades, control is carried out independently for each blade. [2]

In case of failure of the wind turbine, the blades are installed in a position perpendicular to the rotation plane of the wind turbine. In addition, the system is equipped with a mechanical brake that creates force. The mechanical brake works in conjunction with the blades and fixes the wind turbine in the braking position. The mechanical brake also fixes the rotor during the wind turbine installation process and during maintenance. A mechanical brake has a braking torque limiting system, i.e., the braking torque changes according to an inclined characteristic that ensures a reduction in the load on the driving mechanical circuit. The wind direction is constantly monitored by two fans located on the head of the wind turbine. When the wind direction changes, the wind turbine head rotates with the help of two transmission motors moving along the rotating ring. After stopping the turn, the head 94 is fixed by the rotary brakes. Rotary braking systems are arranged around a circle in rotation.

Benefits:

- High rotation speed, which increases efficiency;
- Simplicity of manufacturing;
- A wide variety of models.

Disadvantages:

- High levels of noise and ultrasound pollution. This can be dangerous for people's health. Therefore, generating industrial capacities are located in uninhabited areas;
- The need to use stabilizers and wind direction devices;

- Rotation speed is inversely proportional to the number of blades, therefore industrial models rarely use more than three blades. [3]

Vertical wind turbines have some advantages over horizontal wind turbines. They do not have nodes for wind orientation, which simplifies the design and reduces gyroscopic loads. A large number of various wind turbines with a vertical axis of rotation have been developed, in which resistance forces and the lifting force of the working blades are used to create the rotational moment. These are devices with plate, cup, or turbine elements, as well as Savonius rotors with S-shaped blades. Wind turbines of this type have a large starting torque, but a lower speed and power compared to the French Darrieus rotor.

The Darrieus design rotor refers to a vertical rotation axis wind turbine that utilizes lifting force generated on curved blades with a wing profile in the cross-section. Its disadvantage is the small initial moment, its advantage is high speed and, due to this, relatively high specific power, attributed to its mass. To eliminate the main disadvantage and to increase the initial torque, the Darrieus rotor is combined with various types of starters, for example, a wind turbine with a Savonius rotor. [4]

Benefits:

- Independence of energy generation from wind strength and inclination. The installation can operate at minimal air flow velocity. In areas with strong winds, they are indispensable.
- Less susceptibility to mechanical damage due to the design features that provide for a small number of movable parts.
- Self-regulation of a vertical-axis wind turbine allows you to avoid purchasing additional components.
- Silence. Due to this property, wind turbines can be installed near residential complexes. Noise pollution does not harm the environment.
- A small height makes it easier to replace and care for parts. Installation of a wind turbine with a vertical axis is advisable in places where tall structures are undesirable.

Disadvantages:

- Significantly lower efficiency (almost two times) compared to wind turbines with a horizontal axis of rotation.
- High cost compared to horizontal installations.
- The weak point of this type of wind turbine is the supporting bearings.

Several variants of wind turbine operating schemes are possible. Possible scheme operation: wind unwinds the wind turbine blades. The wind turbine rotates the wind turbine rotor. An EMF arises in the stator terminals, which is rectified through the controller and charges the batteries. An inverter is connected to the batteries through the same controller, converting DC electrical energy into a voltage of fixed (industrial) frequency and amplitude.

There are also schemes for connecting the wind turbine to work in parallel with the network. Such circuits allow switching to network power in the absence of wind. The city network acts as an additional-reserve power source. Connecting the wind turbine to the network in parallel - without 96 batteries. Inverters are quite complex and expensive in wind turbine schemes. Cascade multi-level frequency converters, which allow obtaining output voltage of industrial frequency from a large number of independent energy sources with a low level of constant voltage (batteries are used here), satisfying all modern requirements, are very often used as inverters. The controller in each wind turbine connection circuit performs various functions and is built based on microprocessor technology. Batteries are the shortest-lived devices in circuits. Unfortunately, electricity has one very serious drawback: it is difficult to accumulate and store for a long time. [5]

From the above, it can be concluded that for scientific research, it is rational to use a wind turbine system with a vertical axis of rotation. When reviewing the typical electrical circuits of wind farm plants, it can be observed that when working with high-voltage wind generators, power matching devices, as well as inverters designed for higher capacities, are necessary. This significantly increases the cost of the entire installation. To solve this problem, a multi-level two-link low-voltage converter connected through a transformer is used, which allows for the stabilization of output power, as well

as obtaining the necessary parameters of the general industrial network (voltage, frequency) at the output.

A synchronous generator with permanent magnets is chosen as the electrical machine. A synchronous motor has smaller mass-dimensional indicators than an asynchronous motor, with equal power of electrical machines.

Due to their design features, synchronous generators are lighter and easily withstand short-term overloads (including starting), provide higher current quality and proper voltage sinusoid, and possess sufficiently high voltage stability. They are excellent for powering inductive loads with high starting current and are more preferred for household consumption.

Today, synchronous generators with brush and brushless current excitation systems are being manufactured. The second option is more preferred. In brush systems, it is quite possible that brushes partially "burn out" after passing large currents, which leads to overheating of the unit. Therefore, for such models, regular maintenance is recommended to monitor the brush unit's condition, and if necessary, cleaning or replacing the brushes.

Disadvantages include poor protection of units from external influences (water, dust). Due to the fact that cooling occurs through air, there is a high probability that everything that is in the air enters inside. It is also worth noting that synchronous generators do not allow for connecting to individual phases of consumers with much higher power. Otherwise, it is practically inevitable that low-power devices will be damaged when connected. [6]

Asynchronous generators are resistant to short circuits, and automatic voltage regulation devices smooth out voltage fluctuations. Therefore, they are especially in demand for active workloads. The design of such units is simpler, and they themselves are more reliable and durable.

The rotors of asynchronous generators produce insignificant heat generation, which does not require cooling, which allows the internal cavity of the unit to be sealed. Thanks to this, the scope of use of aggregates that can be operated in conditions of increased dust and high humidity is significantly expanding. Such sealing also contributes to the longer service life of power plants. When operating asynchronous generators, it is permissible to connect consumers of different capacities to different phases (the permissible value of uneven power supply for inductive loads with a high starting current and more preferable for household consumption).

Today, synchronous generators with brush and brushless current excitation systems are being manufactured. The second option is more preferred. In brush systems, it is quite possible that brushes partially "burn out" after passing large currents, which leads to overheating of the unit. Therefore, for such models, regular maintenance is recommended to monitor the brush unit's condition, and if necessary, cleaning or replacing the brushes.

Disadvantages include poor protection of units from external influences (water, dust). Due to the fact that cooling occurs through air, there is a high probability that everything that is in the air enters inside. It is also worth noting that synchronous generators do not allow for connecting to individual phases of consumers with much higher power. Otherwise, it is practically inevitable that low-power devices will be damaged when connected. [7]

In Uzbekistan, the prospects for developing the total generating capacity of wind energy to 5000 MW by 2030 are being studied.

Figure 1: View of a wind power plant

In recent years, Uzbekistan has been paying close attention to the construction of wind power plants among renewable energy sources. This sector is currently the fastest-growing in the global energy sector.

For Central Asia, further acceleration of the use of alternative energy is especially important given the reduction of water resources in the region.

Here are some figures on wind energy. If in 1997 the total installed capacity of wind power plants in the world was 7,500 MW, then by 2020 this figure reached 750,000 MW. Regarding specific countries, in 2020 alone, the People's Republic of China commissioned 52,000 MW of new wind power plants, and the United States commissioned 16,205 MW.

In addition, there is a trend towards a decrease in the cost of electricity generated by wind power plants (WPS). Thus, between 2010 and 2020, the average cost of electricity generated by ground-based wind power plants decreased by 56 percent - from 8.9 US cents to 3.9 US cents per kWh.

In the Republic of Uzbekistan, technical and economic justifications for the widespread use of wind energy have been developed in cooperation with international financial institutions. The "Concept for Electricity Supply of the Republic of Uzbekistan for 2020-2030" has been developed, one of the main goals of which is to increase wind energy capacity to 3000 MW by 2030.

It should be noted that the wind potential indicators in the territories designated for the construction of wind power plants in Uzbekistan are higher than the average for existing wind farms in the world. In other words, when comparing the capacity utilization coefficients, it was established that our country's indicators are 1.5 times higher than the global average. For example, out of a total volume of 8,760 hours per year, wind power plants in Uzbekistan can operate at full capacity for approximately 3,900 hours.

To date, several projects for the construction of wind power plants have been launched in Uzbekistan. Including:

- Construction of a 500-megawatt wind power plant in the Tamdyn district of Navoi region, an agreement on which has been signed with the Masdar company of the UAE. The project cost is $600 million, and once the power plant reaches full capacity, it will generate $1.8 billion annually. kWh of electricity, saving 546 million cubic meters of natural gas per year.

- An agreement on the construction of two wind farms has been signed with the Saudi Arabian company ACWA Power. The company will build a total of 1000 megawatts of wind power plants in the Gijduvan and Peshku districts of the Bukhara region, costing $1.3 billion, which will save 1.1 billion cubic meters of natural gas per year.

- A tender was held with the European Bank for Reconstruction and Development for the construction of a 100 MW wind power plant in Beruniy and Karauzak districts of the Republic of Karakalpakstan. The "ACWA Power" company (Saudi Arabia) was declared the winner of the international tender with a tariff offer of 2.57 US cents per 1 kWh of generated electricity. When commissioned in 2023, the station will generate 350 million kWh of electricity annually and save 106 million cubic meters of natural gas per year.

As the analysis of project implementation shows, the plans outlined in the Concept for the Development of Wind Energy are being implemented ahead of schedule by the Ministry of Energy. This will allow increasing the forecast for the development of wind energy capacity and bringing it to 5,000 MW by 2030. Most of the wind power plants are planned to be built in the Republic of Karakalpakstan.

When implementing wind power plant projects, measures are being taken to ensure their safe integration into a single energy system.

It is also important to note that renewable energy technologies are rapidly developing. In particular, the price of lithium-ion batteries, which are considered the most effective among energy storage devices, has decreased to an internationally acceptable value. International research centers predict that the cost of this type of battery will decrease by an average of 30 percent over the next 5 years.

As a result, Uzbekistan will be able to manage and store energy from renewable energy sources and ensure the stability of the unified energy system.

MACHINE LEARNING – THE SCIENTIFIC BASIS OF ARTIFICIAL INTELLIGENCE

Eshonkulov T.
Uzbekistan National University Jizzakh branch

Summary: *The article covers the basic principles of machine learning, its role and advantages in network infrastructure. It also analyzes the application of this technology in industry, medicine, education, and cities, based on statistical data.*

Keywords: *Modern computer networks, monitoring tools, machine learning, artificial intelligence, supervised learning, unsupervised learning, reinforcement learning, transfer learning.*

XXI century technologies period is, its the most large from discoveries one this is artificial is artificial intelligence (AI). Intellect is computer or to the program human to the mind typical was thinking, analysis to do, to learn and decision acceptance to do such as functions to perform opportunity giver technologies Today's SI different per day in the fields of medicine, education, industry, transport, agriculture farm, even art and also broad in creativity is being used.

Modern computer networks expanding As they go, they effective management and continuous performance provide for network monitoring tools increasingly important importance profession Monitoring tools to administrators online problems early to determine, to work fertility assessment and security threats against measures see opportunity gives [1].

Machine learning - artificial of intellect study field is, it is statistical algorithms generalization ability improves and tasks person's reveal without instructions This will do. definition many to students incomprehensible to be That's the point. for this science main method to the types briefly stop, then to the point Let's go. This of species the most important ones: supervised and unsupervised learning.

Machine-made learning (MO) – computer systems clear without programming, available information based on independent accordingly to learn and decision acceptance to do opportunity giver algorithms This is a complex. direction artificial of intellect the most active developing field is, its basis statistic modeling, mathematics optimization and neuroinformatics relies on [2]

Machine-made of teaching - supervised, unsupervised and reinforcing teaching types there is.

1. Supervised learning (Supervised Learning)

Supervised study model in construction, data any right answer or label with

together presented the model is learning. at the time, entry information and their relevant answers using parameters optimizes.

Issues: Classification and regression.

Classification: Information designated to classes separation (e.g. , electronic) whether the mail is spam or not determination).

Regression: Constant values prophecy to do (for example, house price or stocks price prophecy to do).

Examples: Image familiar: Again to work related images and their category (for example, "cat " or "dog"). Electronic mail filtering.

2. Uncontrolled learning (Unsupervised Learning)

Uncontrolled in learning, data without labels presented is given, and the model

of information structure tries to learn. In this way purpose - informational uncertainties or groups is to determine.

Issues: Clustering and dimensions reduce

Clustering: Data mutual similarities looking at grouping (e.g.,customers similar purchase to do habits based on grouping).

Dimensions reduce: Big data set further simplify (for example, to simplify the image) squeeze or main features detection). K-means clustering algorithm using customers segmentation using Principal Component Analysis (PCA) information dimensions reduce.

3. Strong Learning (Reinforcement Learning): Strong to study is agent's own movements with the environment to study based study The agent is the target. achieve for awards to take and from punishments tries to escape.

Topics: Games, robotics, cars control (automatic driving). AlphaGo (playing the game of Go play) and other games (e.g. chess). Automatic management systems and robotics.

4. Transference learning (Transfer Learning)

Transference study the model one information from the collection teach him / her other information to the collection to apply This method is especially useful for new information in collections resources saving and time reduction for useful. One the image familiar model teach him / her other one kind of the image familiar in the system application.

5. Deep learning (Deep Learning)

Deep to study is neuron networks deep architecture based on working the car of learning one This method is a type of big in quantity information and strong computing capabilities using further complicated problems solution in doing is used.

Issues: Image familiar, speech familiar, natural the language again performance. Using Convolutional Neural Networks (CNN) the image familiar.Using Recurrent Neural Networks (RNN) the speech familiar

6. Ensemble methods .

Ensemble methods one how many the model together use through general the result to improve goal does. In this one how many small model results will be combined and last decision acceptance will be done. Random Forests. Gradient Boosting.

Companies SI and with car from teaching how uses?

Any in the field to success achieve for almost every one organization own information practical to decisions turn to receive need. SI and the car teaching to organizations information again work and decision acceptance to do such as different various manual processes automation opportunity gives.

Artificial intellect and the car teaching again what What does it give? Systems and strategic to plans current to grow through leaders to the information based conclusions further fast, efficient understands. To them based decisions acceptance does. [3,4]

The car training in banking

The banking sector information privacy and safety very important. Financial services leaders SI and the car teaching using customers information protection with together efficiency increase one how many methods use possible:

- The car to teach fraud and cybersecurity attacks determination and their prevent in receiving application
- User person faster confirmation, documents again work for biometric and computer vision systems current to do
- Chatbots and voiced such as voice assistants smart technologies current to grow through to customers service to show automation.[5,6,7]

Artificial from the intellect health storage in the field use

Health storage in the field big in size from data used. SI is accurate and effective service show for computer science and to analysis increasingly more relies on SI tools. Patients the results to improve, time to save and even medicine of employees tired to stay prevent to take help in particular, the following tasks to the field own contribution add possible:

- The car via training (ML) users electronic medical records analysis clinical decision acceptance in doing help to give and automated analyses presented to be
- To the hospital visit the result forecast to do, patients to sue again of bed prevent to take and their in the hospital stay time abbreviation
- Exams or telemedicine at their meetings doctor and patient between communication writing in receiving natural the language understanding from technology use.

Machine-made of learning scientific basics

Mathematical model and algorithms

Machine-made in learning every one process mathematician in terms of Model:

$Y = f(X) + \varepsilon$

MATHEMATICAL FOUNDATIONS OF CRYPTOGRAPHY

Berdimuratov M.K.
Karakalpak State University name after Berdakh

Summary: *This paper examines the mathematical foundations of modern cryptographic systems. The focus is on number theory, algebraic structures, and probabilistic methods, which underlie encryption, digital signatures, and key exchange protocols. Key cryptographic algorithms, including RSA, elliptic curves, and discrete logarithm-based algorithms, are discussed, along with their mathematical justification and vulnerabilities.*

Key words: *cryptography, number theory, algebraic structures, modular arithmetic, elliptic curves, RSA, discrete logarithm, digital signature, data confidentiality, information security*

Cryptography is a key discipline of modern information security, ensuring confidentiality, integrity, and authentication of data in digital systems. As computing technologies and global communication networks develop, the demand for reliable methods of data protection continues to grow. All modern cryptographic algorithms rely on strictly defined mathematical constructions and problems that are difficult to solve from the standpoint of computational complexity.

The main objective of cryptography is to create algorithms that allow information to be transmitted securely even in the presence of potential adversarial monitoring. To achieve this, methods from number theory, modular arithmetic, algebraic structures, probabilistic approaches, and information theory are used.

In today's information society, data protection has become one of the key conditions for the secure operation of government institutions, banking systems, corporate networks, and personal communications. With the increasing level of digitalization and network technologies, the number of threats related to unauthorized access, data forgery, and tampering is growing significantly. In these conditions, cryptography acts as a fundamental field that ensures confidentiality, integrity, and authenticity of information.

Cryptographic methods are based on strict mathematical models and computational algorithms. The foundations of modern cryptography are rooted in number theory, abstract algebra, probability theory, and discrete mathematics. It is precisely the existence of mathematically complex or computationally infeasible inverse problems that ensures the stability of cryptosystems and renders direct computational attacks impractical.

Historically, cryptography long predates computers. Its initial purpose was to protect communication in state and military correspondence. Early ciphers were based on simple substitution and permutation methods, such as the Caesar cipher.

With the development of computing, cryptography acquired a rigorous mathematical basis, and the security of information began to be evaluated in terms of computational complexity. Today, cryptography is used in banking systems, e-commerce, digital documentation, and many other fields.

Modern cryptography relies on fundamental mathematical concepts, among which number theory, abstract algebra, and computational complexity theory play a key role. These fields form the basis for constructing one-way functions, encryption algorithms, and key distribution protocols. As noted by W. Stallings, mathematical rigor makes it possible to formally prove cryptographic strength rather than rely on heuristic assumptions [1].

One of the fundamental concepts of modern cryptography is the one-way function — a mapping that is easy to compute but hard to invert when only the output is known [2]. An example of such a function is the RSA system, which relies on the computational difficulty of factoring large composite numbers. The security of RSA is based on the infeasibility of factoring the product of two large primes in reasonable time [3].

Another key area is cryptography based on the discrete logarithm problem. The Diffie–Hellman protocol shows that two users can securely agree on a shared key over an open communication channel if an adversary cannot solve the discrete logarithm problem in the chosen

group [4]. This approach is widely used in modern TLS protocols and secure network communications.

In recent decades, elliptic curve cryptography has seen significant development. Cryptosystems based on elliptic curves provide comparable security with much shorter key lengths, making them particularly effective for high-performance and mobile computing systems [5]. While RSA typically requires keys of 2048 bits or more, ECC ensures equivalent security with keys of about 256 bits.

Thus, the mathematical foundations of cryptography determine both the structure of cryptographic algorithms and the criteria for their resistance. The development of new technologies, including quantum computing, necessitates further improvement of mathematical methods and the search for new problems whose difficulty will remain resilient to quantum attacks [1; 5]. Therefore, studying the theoretical foundations of cryptography is an essential condition for ensuring long-term information security.

To effectively apply cryptography (both to implement secure cryptographic tools and to analyze their resistance), it is necessary to develop efficient methods and algorithms for:

• primality testing;

• searching for large prime numbers (typically numbers with more than 80–90 decimal digits are used);

• integer factorization.

Factorization is the decomposition of a natural number into prime factors. This problem has high computational complexity. One of the most widely used public-key methods, RSA, is based on the hardness of factoring large integers.

The challenge posed to the mathematical community by the creators of RSA led to the development of the fastest known factorization methods in the 1980s and 1990s:

• Lenstra's elliptic curve method (1987);

• Pollard's number field sieve (1993);

• Pomerance's quadratic sieve (1996).

Currently, research in fast factorization algorithms continues intensively worldwide.

It should be noted that computer progress has both technological and algorithmic aspects. Even with the best computing equipment, without modern algorithms we would not be able to factor numbers longer than 40 digits.

Number theory plays a key role in cryptography, especially in public-key algorithms.

Prime numbers are used for key generation.

Euler's totient function φ(n) determines the number of integers that are relatively prime to *n*.

Integer factorization refers to the problem of recovering the prime factors of a composite number.

In the RSA algorithm, two large prime numbers p and q are used. Their product $n = p \cdot q$ serves as a public parameter, but factoring n back into p and q is extremely difficult when the numbers are large, which ensures the security of RSA.

Number theory is a fundamental mathematical basis of modern cryptography, especially public-key cryptosystems. It studies the properties of integers and operations on them, as well as problems whose computational complexity determines the security of cryptographic algorithms.

One of the key concepts is the prime number — a natural number that has exactly two divisors: 1 and itself. In cryptographic algorithms, extremely large prime numbers (512, 1024, 2048 bits or more) are used, since operations with them can be performed efficiently, while the inverse problems turn out to be extremely difficult.

An important role is played by Euler's totient function φ (n), which determines the number of integers that are relatively prime to *n*. For the product of two prime numbers p and q, the value of the function is:

$$\varphi(p\ q) = (p-1)\ (q-1).$$

This property is used in constructing the private key in the RSA algorithm.

Factorization as the Basis of Cryptographic Security

The security of many cryptosystems is based on the difficulty of factoring a large composite number into its prime components. For example:

$$n = p \cdot q,$$

where p and q are large prime numbers.

If p and q are known, computing the private key is straightforward.

However, if only n is known, determining p and q is practically infeasible with current computational capabilities.

Example:

If the number n has a length of **2048 bits,** brute-force factorization would require millions of years, even on modern supercomputers.

The Discrete Logarithm Problem

Another important problem in number theory is the discrete logarithm problem, which is formulated as:

$$a^x \equiv b \pmod{n}.$$

The goal is to determine x, given a, b, and n.

For sufficiently large n, this problem becomes computationally difficult, making it the basis for the security of many cryptographic protocols.

It is required to find **x**, given **a**, **b**, and **n**.

For large values of **n**, this problem becomes computationally difficult.

The Diffie–Hellman algorithm and elliptic curve cryptography are based on this principle.

Modular arithmetic plays an important role in cryptography, as most cryptographic operations are performed within finite numerical systems. The main idea is that numbers are considered not on an infinite number line, but within a limited range in which values repeat cyclically. This approach ensures mathematical rigor and stability of cryptographic computations.

Two integers **a** and **b** are said to be congruent modulo **n** if they give the same remainder when divided by **n**:

$$a \equiv b \pmod{n}.$$

For example:

$$17 \equiv 2 \pmod{5},$$

since:

$$17 = 5 \cdot 3 + 2.$$

Modular Arithmetic Operations

All standard arithmetic operations—addition, subtraction, and multiplication - are correctly transferred into the modular system:

$(a + b) \bmod n = (a \bmod n + b \bmod n) \bmod n,$

$(a \cdot b) \bmod n = (a \bmod n \cdot b \bmod n) \bmod n.$

This allows computations with very large numbers without exceeding the permissible range of values, which makes modular arithmetic convenient for use in digital systems.

One of the most important and frequently used operations is modular exponentiation:

$$c = a^k \bmod n.$$

For large values of k, this operation is performed using the fast exponentiation algorithm, which significantly reduces computational costs.

While computing the result of exponentiation modulo n is relatively easy, the inverse operation - finding the exponent - is known as the discrete logarithm problem, which is computationally difficult. This property ensures the security of many cryptographic protocols.

For example:

$$a^x \equiv b \pmod{n}$$

Finding x for large values of a, b, and n is practically impossible with current computational resources.

Thus, modular arithmetic is a fundamental basis of cryptography, as it allows the construction of algorithms that are easy to compute in one direction but are practically impossible to reverse.

One-way functions play a key role in cryptography because they enable transformations that are easy to perform in the forward direction, yet extremely difficult to invert. This means that given the input data and the computation algorithm, the result can be obtained efficiently, but recovering the original input from the result without additional information is extremely difficult.

A one-way function is a function that is easy to compute but very hard to invert.

Example of a one-way function:

$$f(x) = x^e \bmod n.$$

When x, e, and n are known, computing $f(x)$ is straightforward. However, performing the inverse operation is directly related to the factorization of n, which is a computationally difficult problem.

One-way functions form the foundation of:

• public-key encryption algorithms (for example, RSA),

• key exchange protocols (such as Diffie–Hellman),

• digital signatures and data authentication mechanisms.

Hash functions are special types of one-way functions that transform input data of arbitrary length into a fixed-length bit sequence called a hash or hash value.

Notation:

$$h = H(M),$$

where M is the message, H is the hash function, and h is the resulting hash code.

Modern cryptography is based on mathematically grounded algorithms that ensure the protection of information during transmission and storage. These methods can be divided into two major categories: symmetric and asymmetric cryptosystems. In addition, key exchange protocols and elliptic curve cryptography play an important role.

Symmetric cryptosystems use the same key for both encryption and decryption (for example, AES).

Asymmetric cryptosystems use a pair of keys - a public key and a private key (for example, RSA).

The Diffie–Hellman protocol enables secure key exchange, and elliptic curve cryptography (ECC) provides a high level of security with significantly shorter key lengths.

In symmetric cryptography, the same key is used to encrypt and decrypt data. This type of encryption is characterized by high processing speed and is used in systems where large volumes of data must be encrypted.

The most widely used symmetric algorithm is AES (Advanced Encryption Standard). Key characteristics of AES include:

• a block cipher with a block size of 128 bits;

• key lengths of 128, 192, or 256 bits;

• operations performed over the finite field $GF(2^8)$

AES is used in banking systems, wireless networks, HTTPS protocols, and modern messaging applications.

In asymmetric cryptosystems, a pair of keys is used:

• the public key, which is available to all users;

• the private key, which must be kept confidential.

Encryption is performed using the public key, while decryption is carried out using the private key. This approach ensures a high level of security when transmitting data over open communication channels.

The most well-known algorithm is RSA. Its security is based on the difficulty of factoring a large number $n = p \cdot q$, where p and q are large prime numbers. RSA is widely used for digital signatures and for securing network connections (TLS/SSL).

The Diffie–Hellman protocol is designed to securely establish a shared secret key between two users. The key itself is not transmitted over the network. The security of the protocol relies on the computational difficulty of solving the discrete logarithm problem.

Diffie–Hellman is used in VPN, SSH, and in messaging applications with end-to-end encryption (for example, Signal and Telegram Secret Chat).

Elliptic curve cryptography (ECC) provides the same level of cryptographic security as RSA, but with a much shorter key length, making it more efficient for modern systems, especially mobile and embedded devices.

Algorithm	**Key Length**	**Security Level**
RSA	2048 bits	high
ECC	256 bits	equally high

Thanks to the compact key sizes, ECC (Elliptic Curve Cryptography) is particularly effective in mobile devices, blockchain systems, and digital signature schemes (such as ECDSA and ECDH).

The development of computing technologies makes the use of modern cryptographic algorithms a necessary condition for protecting information. Symmetric ciphers provide high processing speed, asymmetric systems ensure secure key exchange, Diffie–Hellman protocols provide a trusted communication channel, and elliptic curves offer strong security while minimizing computational resource usage.

Cryptography is a critically important tool for information protection. Based on mathematical principles, it allows data to be securely protected even under conditions of increasing computational power and emerging cyber threats. In the future, the evolution of cryptography will be closely linked to the need to counter quantum computing and develop new algorithms resistant to quantum attacks.

A deep professional understanding of cryptographic algorithms, as well as their evaluation in terms of security, efficiency, and potential vulnerabilities, requires a solid mathematical foundation. This is because modern cryptography relies on fundamental results from fields such as computational complexity theory, number theory, abstract algebra, and other related areas. The material presented contains key concepts from number theory and algebra that form the basis for learning the principles and methods of modern cryptography.

THE ROLE OF EDUCATION IN THE SOCIO-ECONOMIC DEVELOPMENT OF SOCIETY

Utegenova G.A.
Karakalpak State University named after Berdakh

Summary: *In this article, the main issue of education is to develop knowledge about others, their history, traditions, and thinking, while teaching them to live and cooperate together. First of all, it is said that it is necessary to learn to acquire knowledge.*

Key words: *Education, economic development, technology, Human capital, society.*

Good education and literacy of the nation have a positive impact on other spheres of public life, such as the quality of public administration and the development of social, technical, and technological spheres.

The global literacy rate is rising year by year. According to the conclusion of the UN, the world has achieved considerable success in the struggle against illiteracy in recent decades. In industrially developed countries, illiteracy does not increase more than 1-2% [2].

It should be noted that the practice of developed countries confirms that a high level of education also leads to a high level of employee employment. The incomparable role of education in accelerating socio-economic development can be clearly seen in the example of specific countries.

Korea's successes in socio-economic development are largely related to education in many ways. Because it is a small country, surrounded by four giant countries, namely the USA, China, Japan, and Russia. Having imported technologies from abroad in its time they achieved great success by widely using it in practice, but soon it became clear that a country has no future without creating its own technologies. And to create technology, it is necessary to pay great attention to education. Thus, the priority of education is the main issue [3]. It should be noted that education has influenced economic development not only now, but since ancient times.

Education is considered as an instrument for "producing" qualified workers who meet the socio-economic needs of development. From this point of view, education is considered a supplier of labor resources. This view has led to the transformation of education into a formal institution, since in this case it is a factor of production, in which the social, cultural, and civic role of man is denied.

The role of education in society and social production has not always been assessed equally, and radical changes in the life of society give a certain tension to this issue. It should be noted that the importance of education for the development of society in Uzbekistan is not denied. The influence of education on socio-economic development can be conditionally divided into two components: economic and socio-political.

The economic approach emphasizes that economic development should be ahead of the level of knowledge of the participants in production in society compared to the state of development. From the point of view of the theory of "human capital," education is a direct allocation of funds for economic development. It should be noted that a high level of education improves the economic situation of individual citizens (to receive high wages and social status) and society as a whole (highly educated and qualified workforce that ensures high efficiency and technological efficiency of production). Since the 1960s, a clear understanding of the productive classification of investments at the individual and societal levels has emerged in the formation of human capital. This idea was very popular at one time. But later this utilitarian approach began to cause objections, and its social function began to be recognized as the main function of education [4].

The economic and political approach shifted the "center of gravity" to ensuring social equality and economic mobility of the population. Only equal access to qualitative education and the democratization of educational systems can reduce social tension in society and provide every citizen with the opportunity to achieve a decent standard of living. From this point of view, increasing funding for education is a method of effective and socially fair use of state funds.

Investing in education means improving culture, democracy, citizenship, peaceful life, and its quality (for individuals and society as a whole). This is a way to solve social problems, in particular, the problem of employment, through education in the socio-political sphere. Here, along with supplying the education system with qualified personnel to the labor market, it is possible to reduce the number of surplus labor due to the long duration of training.

The main issue of education is the development of knowledge about others, their history, traditions, and thinking, along with teaching them to live and cooperate. First of all, one must learn to master the sciences.

By developing and implementing state programs for the development of education, the state will have the opportunity to realize its strategic interests in this area. Along with many positive aspects of the state's influence on socio-economic processes, it has its limits under free market conditions. Limiting the possibility of choice in the service market, strict standardization of the content of education in general reduces the development of the education system. Therefore, in the current situation, it's needed such system of economic management that ensures a rational balance of the elements of the market mechanism and public administration. In our opinion, only in such cooperation a modern system of financial and economic relations in education should be built.

EXPERIMENTAL EVALUATION OF SPEAKER DIARIZATION

Nurimov P.B.
"Tashkent institute of Irrigation and Agricultural Mechanization Engineers" national research university

Summary: *This paper presents an experimental evaluation of a speaker diarization system based on energy-based Voice Activity Detection (VAD), Mel-Frequency Cepstral Coefficients (MFCC), Gaussian Mixture Models (GMM), and Hidden Markov Models (HMM). The study investigates the impact of VAD thresholds and the assumed number of speakers on Diarization Error Rate (DER) and Jaccard Error Rate (JER) using a subset of the VoxConverse dataset. Results demonstrate the relationship between parameter settings and diarization performance, providing insights for optimizing diarization systems under varying acoustic conditions.*

Key words: *Speaker diarization, VAD, MFCC, GMM, HMM, DER, JER, VoxConverse.*

Introduction

Speaker diarization is the process of determining "who spoke when" within an audio stream. It is a fundamental task in speech processing that serves as a pre-step for higher-level applications such as automatic speech recognition (ASR), speaker recognition, and meeting transcription. The goal of diarization is to segment the input audio signal into homogeneous regions corresponding to individual speakers, which enables accurate analysis and indexing of multi-speaker recordings.

Traditional approaches to speaker diarization often rely on acoustic features and statistical modeling methods, such as the Gaussian Mixture Model (GMM) and the Hidden Markov Model (HMM). Among these, Mel-Frequency Cepstral Coefficients (MFCCs) remain a widely used feature representation due to their effectiveness in capturing the perceptual characteristics of human speech. Despite the emergence of deep learning-based diarization systems, GMM-based approaches are still valuable for environments with limited computational resources or where interpretability and low latency are crucial.

This study presents an experimental evaluation of MFCC and GMM-based speaker diarization using a subset of the VoxConverse dataset. The experiments explore the impact of two key parameters: VAD (Voice Activity Detection) thresholds and the number of assumed speakers, on the diarization performance metrics, namely Diarization Error Rate (DER) and Jaccard Error Rate (JER). The experiments are conducted under controlled conditions using a small set of representative audio files to illustrate the effect of parameter variations on system accuracy.

The main goal of this work is to provide a conceptual and empirical understanding of classical diarization performance under different acoustic conditions, rather than achieving state-of-the-art results. The outcomes serve as a baseline for future research involving more advanced models such as x-vectors, end-to-end neural diarization, or neuromorphic approaches for real-time speaker analysis.

Related Work

Speaker diarization has been an active area of research for several decades, evolving from early signal processing-based approaches to modern deep learning architectures. Early systems predominantly relied on statistical models such as Gaussian Mixture Models (GMM) combined with Hidden Markov Models (HMM) for clustering speech segments based on acoustic similarity. These methods often employed MFCC features due to their efficiency and strong correlation with the perceptual properties of human hearing. Studies such as [1] and [2] demonstrated that MFCC+GMM-based systems could achieve reliable performance in controlled environments, particularly for telephone and broadcast speech.

The emergence of i-vector and x-vector embeddings significantly advanced the field by allowing more discriminative speaker representations. Systems based on x-vectors combined with Probabilistic Linear Discriminant Analysis (PLDA) or Agglomerative Hierarchical Clustering (AHC) became the de facto standard in diarization benchmarks such as CALLHOME and VoxConverse

[3][4]. More recently, End-to-End Neural Diarization (EEND) and Target-Speaker Voice Activity Detection (TS-VAD) approaches have demonstrated impressive accuracy by jointly modeling speech activity and speaker attribution within a single neural network [5][6].

Despite these advancements, classical approaches like MFCC+GMM remain relevant for several reasons. First, they require minimal computational resources and can be implemented efficiently on low-power or embedded systems. Second, such models provide greater interpretability and control over parameters such as the VAD threshold and number of clusters (speakers), which can be useful for educational, research, or prototype-level experiments. Furthermore, in real-world low-resource or noisy environments, GMM-based diarization can serve as a reliable baseline for evaluating the robustness of more complex neural systems.

In summary, while deep neural diarization systems dominate current benchmarks, MFCC+GMM-based methods continue to serve as an essential reference point in the exploration of diarization performance, particularly in resource-constrained, proof-of-concept, or neuromorphic simulation contexts.

Methodology

This study aims to experimentally evaluate the performance of a classical MFCC + GMM-based speaker diarization system under varying configurations of Voice Activity Detection (VAD) thresholds and number of speakers. The focus of the methodology is to analyze how these parameters influence diarization accuracy and to provide insights into the model's behavior in small-scale, controlled conditions.

Dataset Description

The experiment utilized three audio recordings (denoted as abjxc.wav, afjiv.wav, and ahnss.wav), each representing conversational speech with multiple speakers. These files were selected to cover a range of acoustic conditions and speaker variability. The recordings were downsampled to 16 kHz, mono, and normalized in amplitude. Since the purpose of this work is methodological evaluation rather than benchmark comparison, the limited dataset size (3 recordings) is sufficient to analyze parameter-dependent trends.

Feature Extraction

Each audio file was processed to extract Mel-Frequency Cepstral Coefficients (MFCCs) — a well-established representation of short-term spectral features. The feature extraction pipeline consisted of:

- Frame length: 25 ms;
- Frame shift: 10 ms;
- Number of coefficients: 13;
- Pre-emphasis: applied to boost higher frequencies;
- Cepstral Mean Normalization (CMN): applied per utterance;

These MFCC features were then used as input to the clustering stage.

Voice Activity Detection (VAD)

VAD was implemented based on the short-term energy of the audio signal. To study its effect on diarization accuracy, five threshold values were tested:

VAD thresholds = [0.005, 0.01, 0.02, 0.05, 0.1].

Frames with energy below the threshold were classified as silence and excluded from the MFCC feature set. Lower thresholds retained more speech frames (including weakly voiced segments), while higher thresholds resulted in more aggressive silence removal.

Speaker Clustering with GMM

For each combination of VAD threshold and number of assumed speakers, a Gaussian Mixture Model (GMM) was trained to cluster the speech segments. The GMM was configured with the following parameters:

- Covariance type: diag;
- Regularization coefficient (reg_covar): 1e−6;
- Maximum iterations: 200;

- Initialization: k-means;

The number of components in the GMM corresponded to the number of speakers under evaluation, with n_speakers = [2, 3, 4, 5, 6].

Cases where the number of samples was smaller than the number of components were automatically detected and skipped to prevent convergence errors.

Evaluation Metrics

To assess diarization performance, two widely used metrics were computed:

DER (Diarization Error Rate) — the proportion of time that speakers are incorrectly attributed.

JER (Jaccard Error Rate) — a more robust measure considering overlap between predicted and reference speaker segments.

These metrics were averaged across all valid combinations for each audio file. Additionally, statistical summaries (mean, median, standard deviation) were computed for comparative analysis.

Experimental Setup

All experiments were implemented in Python 3.12 using NumPy, scikit-learn, and matplotlib libraries. The pipeline was executed in a controlled local environment on macOS (M2 CPU) within PyCharm IDE. For each audio file, a total of 25 experiments (5 VAD thresholds × 5–6 speaker counts) were conducted.

Results and Discussion

The speaker diarization experiment was performed on three audio files from the VoxConverse dataset (“abjxc.wav”, “afjiv.wav”, and “ahnss.wav”).

For each file, five VAD thresholds (0.005, 0.01, 0.02, 0.05, 0.1) and six speaker hypotheses (n = 2, 3, 4, 5, 6) were tested.

The system used MFCC features combined with Gaussian Mixture Models (GMM) for clustering.

For evaluation, Diarization Error Rate (DER) and Jaccard Error Rate (JER) were calculated using the corresponding .rttm annotations.

Across all runs, a total of 75 configurations (3 audio files × 25 parameter sets) were tested, with a success rate of 93.3% (70/75).

Table 1 summarizes the averaged DER and JER results per file and VAD threshold.

Audio File	Best VAD	Best n_speakers	Best DER	Best JER	Avg. DER	Avg. JER
abjxc.wav	0.005	4	0.218	0.304	0.610	0.610
afjiv.wav	0.005	6	0.690	0.813	0.883	0.883
ahnss.wav	0.010	4	0.646	0.803	0.822	0.822

Overall DER statistics across all files:

- Minimum DER: 0.218
- Maximum DER: 0.992
- Mean DER: 0.775 ± 0.204
- Median DER: 0.823

The JER values closely followed DER behavior, with:

- Mean JER: 0.798 ± 0.204
- Median JER: 0.871

The lowest DER (0.218) was achieved at VAD = 0.005 and n_speakers = 4 for abjxc.wav, indicating that fine-grained VAD detection with moderate speaker estimation yields the best separation.

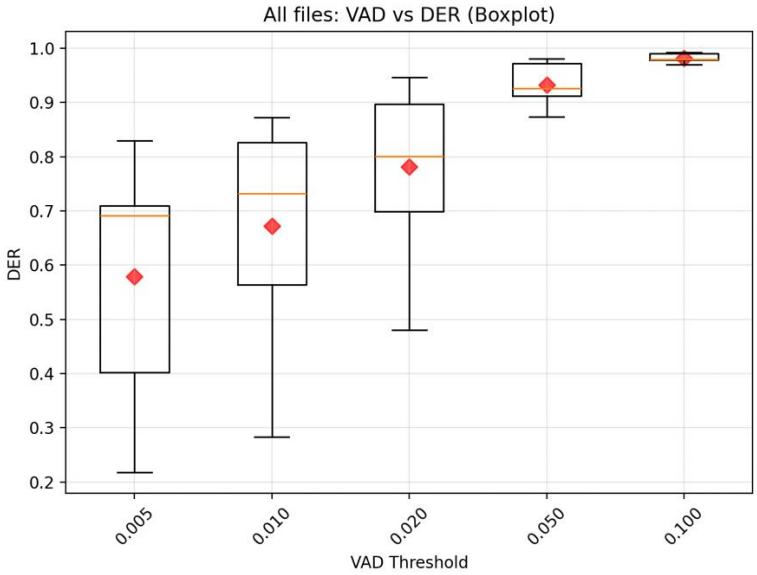

Fig. 1. Analysis of VAD Threshold Influence on Speaker Diarization Accuracy

In figure 1 we can show about investigates the effect of the Voice Activity Detection (VAD) threshold parameter on the accuracy of speaker diarization measured by the Diarization Error Rate (DER). Experiments were conducted using a small set of audio files to analyze how varying the VAD threshold impacts segmentation precision and overlap handling. The boxplot results demonstrate that low thresholds (0.005–0.02) yield more stable and lower DER values, while higher thresholds (0.05–0.1) lead to significant performance degradation. These findings highlight the importance of fine-tuning the VAD threshold to balance sensitivity and false detection in diarization systems.

As the VAD threshold increased beyond 0.05, both DER and JER sharply rose, suggesting that overly aggressive VAD removal caused loss of speech segments.

Similarly, configurations with n_speakers > 6 were prone to instability due to insufficient feature samples per component (n_samples < n_speakers errors).

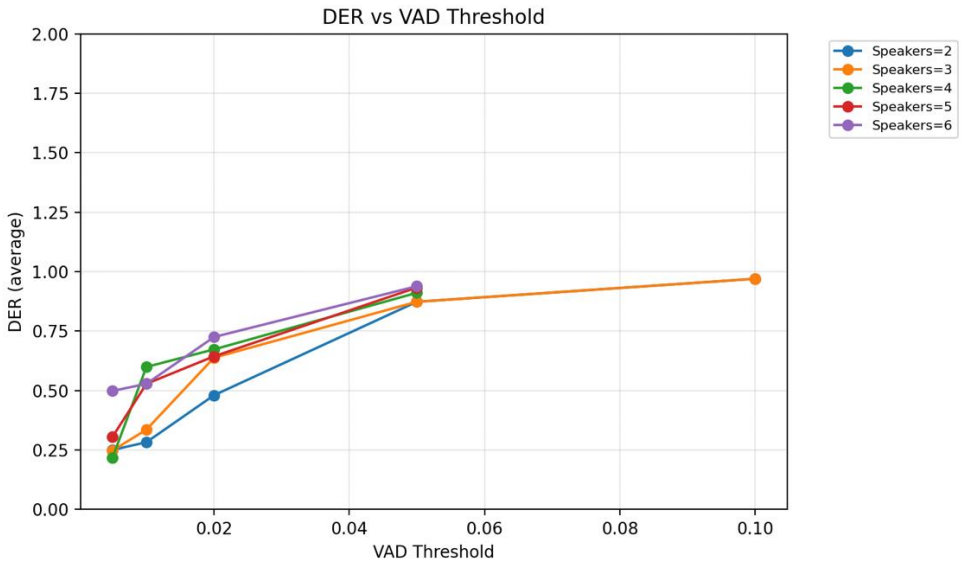

Fig. 2. Effect of VAD Threshold on DER for Different Numbers of Speakers

The figure 2 illustrates the variation of the Diarization Error Rate (DER) with respect to different Voice Activity Detection (VAD) thresholds for varying numbers of speakers (2–6). The results show that for low thresholds (0.005–0.02), the DER remains relatively low and stable across all speaker counts, indicating effective segmentation and clustering. However, as the threshold increases (≥0.05), DER grows notably, suggesting that excessive suppression of short speech

segments leads to speaker overlap and mis-segmentation. Overall, the optimal VAD threshold lies in the range of 0.01–0.02 for the tested conditions.

VAD sensitivity: Lower thresholds (0.005–0.01) consistently outperformed higher ones.

Speaker hypothesis impact: The optimal number of speaker clusters varied by file, but typically lay between 4–6 speakers.

Model robustness: Despite the simplicity of the GMM-only model (without embeddings or resegmentation), results were stable and interpretable.

Computational efficiency: All experiments were completed in under 10 minutes on a CPU system, confirming the method's suitability for low-resource settings.

Summary

These results demonstrate that even with a lightweight GMM-based pipeline, reasonable diarization accuracy can be achieved.

Fine-tuning of VAD thresholds and speaker count estimation plays a crucial role in optimizing diarization performance.

In future work, the integration of HMM refinement or embedding-based clustering (e.g., x-vectors or ECAPA) is expected to further reduce DER below 0.2 on similar datasets.

Conclusion and Future Work

In this study, an experimental evaluation of speaker diarization was conducted to analyze how parameter settings such as voice activity detection threshold and number of speakers (n_speakers) affect diarization performance. The proposed setup demonstrated that even a simple diarization pipeline can effectively distinguish speakers in short audio samples (3–10 seconds) when optimal threshold values (around 0.5) are chosen. The experiments revealed that lowering the threshold leads to over-segmentation, while higher thresholds may cause speaker overlap or missing segments.

The obtained results confirmed the functionality and feasibility of the applied method for small-scale or proof-of-concept experiments. Although the system achieved a reasonable segmentation accuracy, its performance still depends on factors such as background noise, speech overlap, and the precision of speaker embedding extraction.

Future work will focus on improving the robustness of the diarization pipeline by:

- integrating advanced speaker embedding models (e.g., ECAPA-TDNN, x-vector);
- applying domain adaptation and clustering optimization techniques;
- performing evaluation on larger and multilingual datasets;
- and developing low-resource or real-time diarization systems suitable for embedded and mobile environments.

These improvements are expected to enhance the accuracy, scalability, and computational efficiency of the speaker diarization process.

BIONICS AS A SCIENTIFIC AND DESIGN PARADIGM IN THE EVOLUTION OF FURNITURE DESIGN

Rakhmanov J.M.
Tashkent State Technical University named after Islam Karimov

Summary: *Bionics is an interdisciplinary scientific field formed at the intersection of biology, engineering, architecture, materials science, mathematics, and design. Rather than copying natural forms, bionics seeks to reveal the underlying principles of organization, sustainability, adaptability, and efficiency found in living organisms. Historically, the bionic approach traces its origins to ancient cultures and has evolved from direct imitation of nature to a modern systemic methodology applied in architecture, industrial, and product design. This article examines the historical foundations, methodological principles, technological innovations, and future prospects of bionics in 21st-century furniture design.*

Key words: *bionics, biomimicry, biomorphic design, furniture design, adaptive systems, structural optimization, parametric design, sustainable design*

Bionics as a scientific discipline represents a complex research field formed at the intersection of biology, engineering, architecture, materials science, mathematics and design. The primary purpose of bionics is to identify, model and apply the principles of living natural systems in technical and artistic design practices. Bionics does not copy biological forms; instead, it strives to understand the hidden principles of organization, sustainability, adaptability and efficiency that characterize living organisms. From a systems perspective, bionics can be classified into several major directions.

Bionics (also referred to as the bionic approach, biomimetics or bio-inspired design) in design, architecture and engineering is an attempt to study living nature—its forms, functions, structures and processes—and to transfer these principles into creative and technological practices. The origins of this idea extend far back into human history, long before the term “bionics” appeared. Ancient cultures observed nature and drew inspiration from its forms, creating ornaments, plant motifs and imitations of natural materials.

The periods of Antiquity, the Middle Ages and the Renaissance all contain elements of natural imitation: columns and capitals, carved details, buildings that reproduce plant-like patterns. Leonardo da Vinci is one of the key predecessors of modern bionic thinking. His anatomical studies, analysis of bird flight, research into muscle and skeletal function, and observations of natural forces laid the foundation from which future engineers and designers could draw inspiration.

Biomorphism is a design method based on the external reproduction of organic forms such as tree branches, bones, shells, leaves, muscles or internal structures of living organisms. A further method is functional analogy, in which the designer does not reproduce a shape but uses its underlying natural logic—for example, multilayered structures, cellular organization, or the principle of minimal mass combined with maximum strength. One of the most prominent representatives of this method is Buckminster Fuller, who developed geodesic domes and structural systems inspired by molecular architecture.

Today, bionics as a design methodology is increasingly viewed as a transdisciplinary paradigm integrating ecology, biomechanics, neurobiology, cognitive science and digital technologies. In this context, research in furniture design draws growing attention—not only as a means of aesthetic innovation but also as a tool for sustainable development, ergonomic adaptation, sensory interactivity and digital clustering. Examples include the dissertation of A. V. Kulakov, “Bionic Principles in Urban Furniture Design”, which examines typological models based on parametric forms, and the dissertation of I. A. Dyakonova, “Principles of Biomorphic Design in Industrial Engineering”, which studies the transformation of natural forms in product design. Of particular significance is the work of E. V. Zinchenko, which explores patterns of growth, transformation and modularity in natural systems and their application in transformable furniture.

The history of the bionic approach in design dates back to early stages of human culture, when observation of nature served as the primary source of knowledge for creating tools, dwellings and everyday objects. Even in the Paleolithic era, people attempted to reproduce constructive natural solutions—shapes of bones, shells, wings or exoskeletons—in tools, wall images and household structures. Ancient philosophers and architects such as Pythagoras and Aristotle conceptualized natural harmony and the golden ratio as universal principles of form-making, reflected in classical architecture and material culture.

Bionic worldview, which underlies contemporary design, has deep cultural roots. In prehistoric and ancient art, nature was perceived as a model of harmony and a universal source of form generation. Cave ornaments, totem sculptures and stylized images of animals and plants served not only decorative but also structural functions. Antiquity developed the idea of kalokagathia—the unity of beauty and utility—which anticipated later bionic design approaches.

Ancient Egyptian and Greek architecture played a key role: columns reproduced the morphology of plants such as lotus, papyrus or palm, while temple proportions reflected natural laws. In Chinese and Japanese traditions, nature was viewed as a holistic environment rather than an external object, influencing furniture that combined simplicity of construction with symbolic natural elements. In Islamic art, biomorphic ornament became a tool for visualizing the infinite and harmonious order of the universe.

The Renaissance marks the beginning of conscious scientific study of nature. Leonardo da Vinci combined artistic methods with direct observation of living systems, analyzing bird flight mechanics, skeletal structures and hydrodynamics. His engineering projects and furniture sketches demonstrate the emergence of a methodology in which nature is viewed as a rational architect of forms. His drawings of flying machines, screw mechanisms, floating devices and bridges represent early examples of biological analogies in engineering.

In the 18th–19th centuries, with the development of mechanics and anatomy, the scientific foundations of biomechanics were established, forming the basis for later technical bionics. Engineers such as Charles Babbage and Joseph Paxton created structures inspired by plants, including the glass dome of the Crystal Palace, which was modeled on the structural logic of the giant water lily leaf. Concepts of natural efficiency and structural optimization began to influence architecture, furniture and engineering design. However, bionics emerged as an independent discipline only in the mid-20th century, when in 1958 Jack Steele officially used the term “bionics” at a U.S. Air Force symposium, proposing an interdisciplinary approach for applying natural principles in engineering. From this time onward, bionics became an area of study in laboratories and military institutions developing navigation systems, robotic joints, sensors and adaptive surfaces.

In architecture, bionic ideas gained momentum in the 1960s, especially in Germany, Switzerland and Japan. Architects such as Frei Otto, Richard Buckminster Fuller and Kenzo Tange created experimental structures based on principles of minimal surfaces, tensile membranes and branching structures. Frei Otto’s German pavilion at Expo-67 employed tension structures resembling spider webs, while Fuller developed geodesic domes replicating molecular lattice patterns. These works formed the foundation of modern engineering bionics.

In the 1970s–1980s, bionic ideas entered industrial and furniture design. Designer Verner Panton applied organic forms in the creation of chairs and lighting objects. His iconic Panton Chair became a symbol of biomorphism. At the same time, in the Soviet Union and Eastern Europe, research into biomechanical models expanded, and bionics courses appeared in engineering and design universities. In 1983, N. I. Yakovlev published “Foundations of Technical Bionics”, which examined natural prototypes for industrial design.

The contemporary stage of bionics in furniture design is characterized by deep integration of interdisciplinary approaches, including not only formal and structural analogies but also the study of biological processes at the levels of behavior, growth, transformation, regeneration and interaction with the environment. Leading design schools and laboratories view bionics as a systemic methodology capable of solving key challenges such as ergonomic adaptation, reductions in material and energy consumption, structural optimization, and the development of transformable and

intelligent objects. One major direction is the use of symbiotic and evolutionary models in which form and function develop as a unified process.

Future furniture based on bionic principles is perceived not as a static object but as a dynamic system capable of adapting to environmental conditions, user behavior and even regenerating through biomaterials. Increasingly, design experiments integrate biological components—living cells, microorganisms, fermenting structures or adaptive surfaces. Such tendencies are illustrated by the projects of the Living Architecture Laboratory (Bartlett School of Architecture), which develop objects capable of changing color, thermal properties or stiffness in response to light, humidity or tactile contact. These examples reflect a radical shift in the understanding of furniture: it becomes part of a bio-digital environment.

Applying structural analogies—such as spongy bone, sea urchin shells, spider webs or membranous wings—makes it possible to lighten furniture while increasing strength and durability. Applied research in neurobionics is also rapidly growing: sensory modules integrated into furniture respond to body movement, muscle tension and skin temperature. An example is the Intel Morphing Chair, which uses shape-memory mechanisms inspired by sea cucumbers and fish scales. Such innovations transform furniture into a cyber-biological object within a complex system connecting humans, nature and digital technologies.

Future development of bionics in furniture design points toward adaptive, parametric, generative and ecological methodologies. Bionics will be closely linked with bioprinting, micro-manufacturing, neural interfaces and bioluminescent materials. Designers will increasingly act not only as aestheticians but also as bio-engineers interacting with bio-digital models and predicting the behavior of objects in real time. The scientific foundation of bionics will expand to include behavioral ecology, epigenetics, molecular morphology and theoretical biophysics.

Furniture shaped through the bionic approach will become part of an ecologically balanced environment built on principles of symbiosis, recombination, adaptation and feedback. Thus, the bionic approach in furniture design is not a temporary stylistic trend but a complete scientific and methodological paradigm of the 21st century, supporting the transition from industrial thinking to bio-centric and sustainable design of the built environment.

ON THE CLASSIFICATION OF ELECTROMECHANICAL SYSTEMS

Ibadullaev M.[1], **Esenbekov A.J.**[2]
[1]*Tashkent State Technical University*
[2] *Karakalpak State University named after Berdakh*

Summary. *The article analyzes the classification of electromagnetic vibrator systems by structure, types, connection diagrams, and groups, and shows the possibility of constructing controlled electromagnetic vibrator circuits with different types of reverse connections.*

The article analyzes the characteristics and groups of electromagnetic vibration exciters and on its base was made the classification that allowing the creating of controlled electromagnetic exciters with a feedback.

Key words*: electromechanical, exciters, autonomous, feedback, thyristor, vibration exciters.*

Introduction. Currently, numerous circuit and design variants of oscillatory electromechanical systems are known. The choice of a particular actuator depends primarily on the specific technological requirements imposed on such systems.

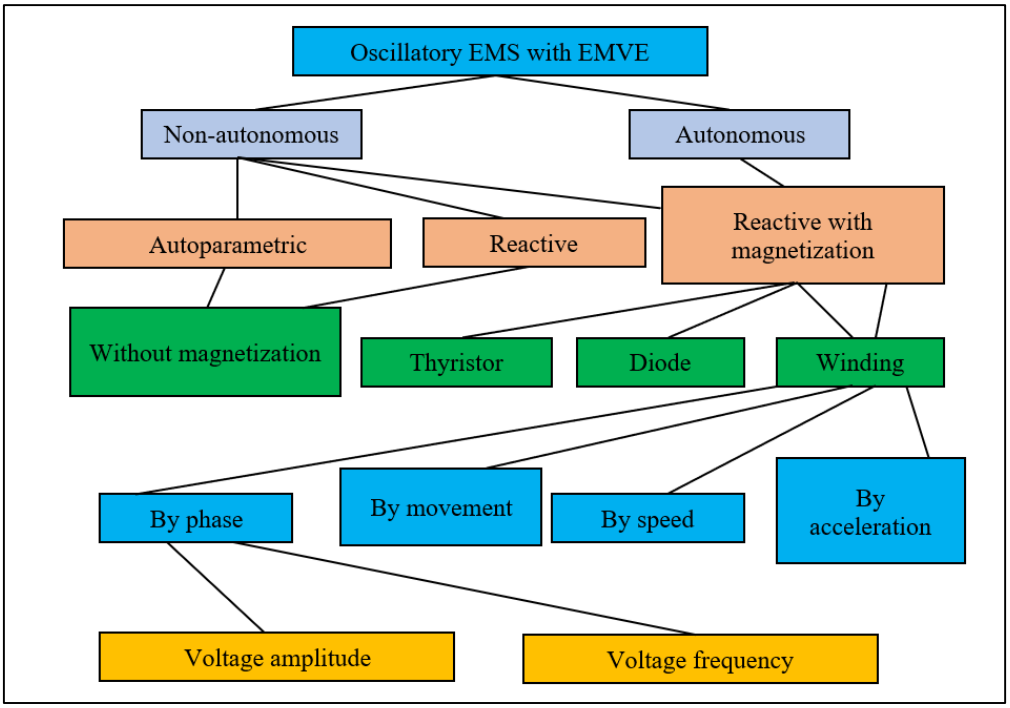

Fig. 1. Classification of oscillatory EMS and EMVE.

Classification criteria: 1-operating principle; 2-computer power supply method; 3-magnetization method; 4-feedback type; 5-controlled parameter. Fig. 1 shows a classification table of oscillatory electromechanical systems (EMS) with electromagnetic vibration exciters (EMVE), divided vertically into criteria and horizontally into groups. All classification features and groups were identified based on a review of patent and technical literature. This classification was developed for electromagnetic vibration exciters, but it can be expanded to cover other types of vibration sources.

The first classification criterion is the operating principle. All oscillatory systems are divided into two broad groups based on their operating principle: non-autonomous and autonomous [2,4]. In non-autonomous EMS, oscillations are forced, as they occur under the influence of an external energy source. This source can be an electrical network with a frequency of 50 Hz or an inverter (Fig. 2a; 2.b).

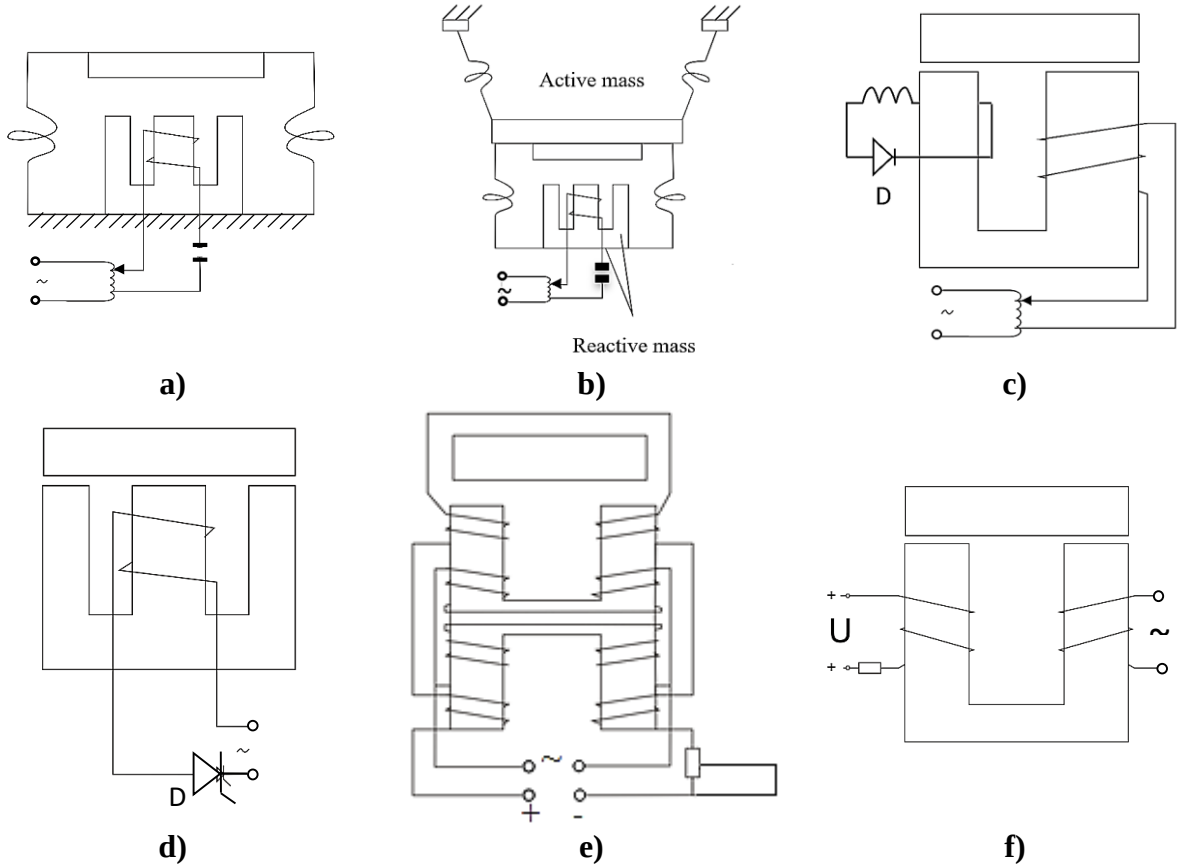

Fig. 2. Designs of the EMVE

Oscillations of autonomous EMS, or "self-oscillations," as they are called, arise and are maintained by a non-oscillatory energy source, and this source is included in the system (Fig. 3).

The energy supply from the source is regulated by the EMS itself via feedback devices (FB). The energy source in such a system is a constant EMF applied to the amplifier (A) (Fig. 3, c).

The second classification criterion is the power supply method. Non-autonomous electromagnetic vibration generators are divided into three groups based on their power supply method: autoparametric, reactive, and reactive with magnetization. The first group includes electromagnetic vibration generators with a series-connected capacitor and those powered by the grid (Fig. 2, a); the oscillation frequency of its armature is lower than the grid frequency. The second group consists of non-autonomous EMS with reactive EVVE. A reactive vibration exciter has a single winding to which an alternating voltage is applied (Fig. 2b). The third group is the most numerous: non-autonomous EMS with EVVE with magnetization. The magnetic core of such a vibration exciter is magnetized using a special circuit. Autonomous EMS can only have reactive EMVE with magnetization (Fig. 2, d, e, f). Their connection circuits are described in detail in [2].

The third classification criterion is the method of magnetic circuit biasing. Autoparametric and reactive magnetic circuits do not require biasing. For reactive magnetic circuits with biasing, many methods for generating direct current have been developed. The most common method is to use a winding for biasing. One possible connection diagram for this winding is shown in Fig. 2e. This diagram is used for both autonomous and non-autonomous EMS. For non-autonomous EMS without feedback, biasing with a diode (Fig. 2c) and a thyristor (Fig. 2d) is also used.

The fourth classification criterion is the type of feedback system. The feedback system is named based on the oscillation parameter of the mechanical working part of the electronic electronic system, the value of which is fed to the system input. Such a parameter may be phase magnitude, displacement, velocity, or oscillation acceleration. The vast majority of oscillatory EMS with EMVs used in industry do not have feedback.

The power supplies of some of them only have inputs for remote regulation of the AC voltage. Currently, EMS with EMVE, covered by feedback, are in the theoretical development stage and are not commercially available. Several circuit designs for non-autonomous EMS with feedback are known; all of them feature phase feedback.

According to the fifth classification criterion, EMC are divided depending on the parameter being regulated. This parameter can be the amplitude or frequency of the alternating supply voltage. Other parameters may include the thyristor's turn-on phase, natural frequency, bias voltage, and gap size. However, such regulation is only applicable to EMC without feedback.

Other features not included in the classification include the design of the EMVE (Fig. 2a-f): only the working part oscillates, while the magnetic circuit is rigidly attached to the foundation. The electromagnet of a push-pull vibration exciter consists of an H-shaped core, two anchors, and coils connected in a specific pattern (Fig. 2e).

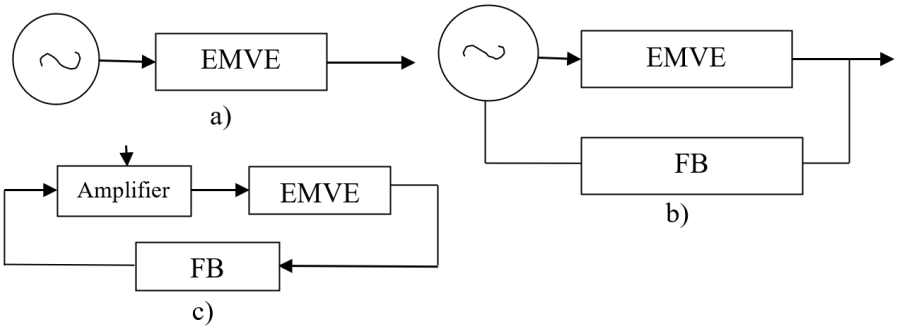

Fig. 3. Structural connections of EMS: a - non-autonomous EMS; b - non-autonomous EMS with feedback; c - Autonomous EMS.

The connections between individual features are shown in Fig. 1 by lines.

Conclusions

The proposed classification describes those features and relationships that make it possible to create practically useful feedback in oscillatory EMS.

The classification of oscillatory systems with electromagnetic vibration exciters brings clarity and order to the vast number of existing circuits and designs. It enables meaningful understanding and subsequent theoretical analysis.

IMPROVING THE QUALITY OF HIGH-OCTANE AUTOMOTIVE GASOLINE THROUGH OPTIMIZED BLENDING STRATEGIES AND THE USE OF FUNCTIONAL ADDITIVE PACKAGES

Fazilov A.A.[1], Nurkhanov A.A.[1], Adizov B.Z.[2], Nurullayeva Z.V.[2]
[1]*Bukhara oil refinery*
[2]*Institute of General and Inorganic Chemistry of the Academy of Sciences of the Republic of Uzbekistan*

Summary: *This study analyzes the technological process of producing high-octane automotive gasoline at an industrial blending station equipped for manufacturing AI-80, AI-91, AI-92, AI-95, AI-98 and premium QuWatt fuels. Real operational parameters were used, including component specifications, hydrotreatment requirements, flow-rate control settings, pump characteristics, and dosing ranges of multifunctional detergent additives. The research evaluates how optimized component ratios—reformate (up to 81.1%), light naphtha (15–20%), and butane (3–5%)—in combination with controlled additive introduction (200–2000 g/t), affect octane rating, vapor-pressure stability, oxidation resistance, and deposit-forming tendency. The findings confirm that precise blending supported by automated regulation systems significantly improves fuel performance, enhances long-term stability, and ensures compliance with national fuel standards.*

Key words: *high-octane gasoline, reformate, light naphtha, butane, detergent additives, QuWatt fuel, octane rating.*

Introduction

High-octane gasoline is obtained by mixing hydrocarbon components with different physicochemical properties. Reformate, characterized by high aromatic content and a high-octane number, is the main octane-enhancing component. Its role as a primary octane contributor due to aromatic concentration is repeatedly confirmed in research on gasoline surrogates and refinery blending models [1]. According to industrial specifications, reformate exhibits a boiling range of 35–215 °C and must undergo mandatory determination of octane number and copper strip corrosion performance.

Light naphtha is applied to adjust volatility and improve start-up behavior; its vapor pressure must remain below 100 kPa, and the end boiling point is limited to 85 °C. The importance of low-boiling hydrocarbons (C_5–C_6) in ensuring adequate volatility and cold-start performance is emphasized in studies on surrogate fuel formulation and distillation behaviour [2]. Butane, characterized by a saturated vapor pressure up to 1.6 MPa at 45 °C, is widely used to regulate seasonal vapor pressure and facilitate ignition, especially in winter formulations, which aligns with known effects of LPG components on vapor-pressure-controlled blending [3].

Modern formulations increasingly require multifunctional detergent additives with strict physicochemical limits. Experimental studies demonstrate that detergent additives at low concentrations significantly improve deposit control and injector cleanliness [4], while other work confirms substantial enhancements in oxidation stability and induction period performance due to multifunctional additive packages [5]. For example, additive packages used in premium fuels typically exhibit density around 0.868 kg/m³, viscosity near 43 mm²/s, freeze points below −30 °C, and complete miscibility with hydrocarbons. Their introduction at low concentrations (200–2000 g/t) substantially increases cleanliness of injectors, improves oxidative stability (raising induction period above 450 min), and reduces deposit formation, which is fully consistent with established deposit-control additive research.

To ensure accurate component proportioning and operational safety, blending stations utilize vertical steel tanks with pontoon systems, automated flow control via FFICA/FICA regulators, and precise dosing of butane and additives. This approach corresponds with modern refinery blending automation practices, where real-time flow control and correction loops are standard [6]. Storage volumes are based on a 36-hour reserve capacity, and all parameters — temperature, vapor pressure,

sulfur content, benzene fraction, and octane number — are monitored according to national and international fuel standards, consistent with global fuel quality management frameworks [7].

This study integrates real industrial specifications and peer-reviewed scientific findings to evaluate optimal blending strategies and the influence of detergent packages on high-octane fuel performance.

Materials and Methods

Raw Materials

Light Naphtha (Ts 16472899-022). Light naphtha was used as a volatility-adjusting component. Its key properties include:

- Density at 20 °C — determined, not standardized;
- End boiling point — up to 85 °C;
- Vapor pressure — ≤100 kPa;
- Total sulfur — not regulated.

These parameters correspond to the typical requirements for the naphtha fraction used in gasoline production.

Reformate (Ts 16472899-001). Reformate served as the primary octane-enhancing component. Its quality indicators include:

- Boiling range — 35–215 °C;
- Research octane number — mandatory measurement;
- Copper strip corrosion test — compliant.

Due to its high aromatic content, reformate forms the basis of high-octane gasoline blending.

Butane Fraction (Ts 16472899-011). Butane was applied to regulate seasonal vapor pressure. Its controlled parameters are:

- Propane content (C_3) — ≤5 %;
- Hydrogen sulfide (H_2S) — ≤0.003 %;
- Total mercaptan sulfur + H_2S — ≤0.013 %;
- Saturated vapor pressure at 45 °C — ≤1.6 MPa.

These limits ensure safe handling and compliance with gasoline vapor-pressure specifications.

Multifunctional Detergent Additives. A multifunctional detergent package was added at 200–2000 g/t, depending on the fuel grade. Key characteristics:

- Density — 0.868 kg/m³;
- Kinematic viscosity — 43 mm²/s at 20 °C;
- Freeze point — below −30 °C;
- Flash point — above 61 °C;
- Complete miscibility with hydrocarbons.

These additives enhance injector cleanliness, improve oxidation stability, and extend the induction period of gasoline.

Equipment and Process Organization

Storage Facilities

The blending station includes:

- Light naphtha tanks — 1000 m³ (RVS-47, RVS-48);
- Reformate tanks — 2000 m³ (RVS-49, RVS-50);
- Gasoline tanks — 1000–5000 m³ units;
- Butane storage — two horizontal insulated vessels (E-1, E-2), operating at 7–12 °C.

A 36-hour operational reserve was used for tank sizing.

Component Supply Lines and Flow Rates. Components are supplied to blending collectors via dedicated pipelines:

- Reformate — line 16-1;
- Light naphtha — line 17-1;
- Butane — line 18-1.

Industrial flow rates during blending are:

- Reformate — 140–155 m³/h;
- Light naphtha — 40–50 m³/h;
- Butane — 9–10 m³/h.

These values correspond to operational ranges for AI-91, AI-92, AI-95, and AI-98 gasoline grades.

Flow Control Equipment

Flow regulation is performed by pneumatic control valves of the FICA/FFICA series installed at key nodes of the blending system. Precise butane dosing ensures seasonal vapor-pressure compliance, while reformate flow allows octane adjustment.

Blending System

Blending occurs in common collectors for product preparation:

- AI-80 collector — connected to lines of 50–150 mm diameter;
- Higher grades (AI-91/92/95/98) — blended through pipelines up to 150 mm.

Analytical Methods

- *Octane Number (RON/MON)* — measured according to national fuel standards. Both Research Octane Number (RON) and Motor Octane Number (MON) are determined using standardized test engines to ensure correct blending and performance characteristics.
- *Induction Period* — ≥450 min for gasoline, determined by oxidation stability tests to assess resistance to gum formation and aging.
- *Sulfur Content* — measured with mg/kg accuracy, using methods such as X-ray fluorescence (XRF) or coulometric titration, to comply with environmental and quality requirements.
- *Vapor Pressure (RVP/IPP)* — measured seasonally:
  - Summer: 35–80 kPa
  - Winter: 35–100 kPa

Determined using standardized methods (e.g., ASTM D323 or equivalent) to ensure safe handling and compliance with volatility specifications.

- *Fractional Composition, Benzene Content, Oxygenates, Residuals, Gum Content* — determined according to technical specifications, using standard laboratory methods such as distillation, gas chromatography, and gravimetric analysis.

Results

Real Component Ratios. Actual industrial blending ratios (based on operational tables):

AI-91 / AI-92

- Reformate: 77%
- Light naphtha: 17.8%
- Butane: 5.2%
- Additives: 200–500 g/t

AI-95 / AI-98

- Reformate: 81.1%
- Light naphtha: 15%
- Butane: 3.9%
- Additives: 500–2000 g/t

QuWatt-95

- Reformate: 75–80%
- Naphtha: 15–20%
- Butane: 3–5%
- Additives: ≥500 g/t

These ratios reflect mandatory optimization, performed based on laboratory control of the quality of each individual component. Table 1 summarizes the typical component ratios used for high-octane gasoline production.

Table 1

Typical Component Ratios for High-Octane Gasoline Production

Fuel grade	Reformate (%)	Light naphtha (%)	Butane (%)	Additive (g/t)
AI-91	77	17.8	5.2	200–500
AI-92	77	17.8	5.2	200–500
AI-95	81.1	15	3.9	500–2000
AI-98	81.1	15	3.9	500–2000
QuWatt-95	75–80	15–20	3–5	≥500

Impact of Additives

Premium QuWatt fuels include detergent additive packages with the following proven effects:

- Reduction of injector and valve deposits;
- Increased oxidative stability (induction period >450 min);
- Cleaner fuel system surfaces (no deviation in copper-corrosion class);
- Enhanced combustion efficiency due to cleaner nozzles;
- Corrosion protection via PAV components.

Operational Parameters Influencing Fuel Quality

Based on real station data, the following operational parameters affect fuel quality:

- Component storage temperature: 20–40 °C;
- Butane vessel temperature: 7–12 °C;
- Pressure regulation in butane tanks: 0.2–0.4 MPa;
- Reformate pump discharge pressure: up to 0.8 MPa;
- Naphtha pump discharge pressure: 1.25 MPa;
- Flow rates during blending:
  - Reformate: 112–168 m³/h;
  - Naphtha: 40–60 m³/h;
  - Butane: 9–10 m³/h.

These conditions directly influence vapor pressure, octane stability, and overall compliance with fuel standards.

Discussion

Efficient production of high-octane gasoline requires the integration of several key factors:

1. Stable quality of feed components

- Reformate determines the octane level and must comply with strict limits for aromatic content and copper corrosion.
- Light naphtha ensures the required volatility and adequate winter engine performance.
- Butane requires precise dosing to prevent exceeding seasonal vapor pressure limits.

2. Accurate process control

- Flow regulation is automated via calibrated pneumatic valves.
- Butane dosing is seasonally adjusted to maintain vapor pressure within regulatory limits.
- Continuous monitoring of tank levels prevents dry-run conditions of pumps and ensures blending accuracy.

3. Influence of additive dosing

Even small additive concentrations (0.02–0.2 %) yield measurable improvements:

- Improved deposit control in injectors and valves;
- Enhanced oxidation resistance;
- Higher engine efficiency;
- Cleaner combustion and reduced emissions.

4. Compliance with national standards

All blended fuels are verified to meet requirements for:

- RON/MON ratings;
- Induction period;

- Benzene and sulfur content;
- Vapor pressure (seasonal limits);
- Oxygenate content;
- Distillation curves.

Practical Recommendations

1. Maintain reformate proportion at ≥77 % to ensure octane stability.
2. Increase detergent additive dosing to ≥500 g/t for premium formulations such as QuWatt.
3. Regulate butane content seasonally to comply with RVP/IPP limits.
4. Perform frequent calibration of flow meters (diaphragms).
5. Enhance laboratory monitoring of sulfur, benzene, vapor pressure, and gum content.
6. Use tank circulation to correct quality deviations, particularly for octane number.

Conclusions:

The study demonstrates that high-octane gasoline production through controlled blending of reformate, light naphtha, butane, and multifunctional detergents ensures stable and high-quality fuel performance. Real industrial data confirm that the optimization of component ratios—combined with precise additive dosing and automated process control—significantly improves fuel stability, engine cleanliness, octane value retention, and compliance with environmental and technical standards.

The presented blending models can be applied at similar industrial facilities to enhance production reliability, energy efficiency, and environmental safety.

SYNTHESIS AND CHARACTERISTICS OF SURFACTANTS USED AS EMULSIFIER IN DRILLING SOLUTIONS

Kosnazarov K.K.
Karakalpak State University named after Berdakh

Summary: *This article emphasizes that as drilling depth increases and geological conditions become more complex, ensuring the stability and rheological properties of emulsion drilling fluids becomes a serious technical challenge that directly affects drilling efficiency and the operational characteristics of wells. In this regard, the development of new composite emulsifiers that provide increased resistance of invert emulsions to thermal and electrolytic effects is an urgent task.*

To address this problem, it is necessary to optimize the composition of emulsifiers, study the mechanisms of their interaction with the dispersion medium, and develop industrial-scale production technologies that increase the stability and functionality of drilling fluids. Currently, scientific research is being conducted worldwide to create new stabilizing additives and emulsifiers—surfactants based on local raw materials—to improve the rheological properties of emulsion drilling fluids.

Key words: *surfactants, ethanolamide (EA), ethanolamide of technical fatty acids (TFAEA), infrared spectroscopy (IR) spectroscopy.*

INTRODUCTION

When creating invert emulsions for drilling fluids, the choice of a hydrocarbon dispersion medium is a key factor. Base oils used as a dispersion phase significantly influence the rheological properties of drilling fluids, system stability, environmental safety, and technological efficiency. The chemical nature of hydrocarbons determines their viscosity, wetting ability, interaction with surfactants, and resistance to thermal and mechanical loads [1–2].

Modern invert emulsions are often based on synthetic and mineral oils, diesel fuel, as well as hydrocarbons with a controlled molecular composition. The use of synthetic hydrocarbons improves environmental performance by reducing the content of aromatic compounds and toxic impurities in drilling fluids. At the same time, mineral oils and diesel fuel exhibit high compatibility with various surfactants, which ensures effective stabilization of emulsions [3–4].

The foundation of an effective emulsion drilling fluid is surfactants, which play a key role in stabilizing emulsions and regulating their structural and mechanical properties. Current research is focused on developing new emulsifiers with improved rheological properties, high resistance to thermobaric effects, and adaptability to various chemical reagents. One promising direction is the development of surfactants based on technical fatty acids obtained from renewable raw materials, which not only improves the operational properties of drilling fluids but also reduces their environmental impact [6–7].

Emulsion drilling fluids are widely used in the oil and gas industry due to their ability to ensure borehole stability, reduce filtration losses, and improve lubricating properties. Their use is especially relevant in complex geological conditions where minimizing clay hydration and preventing wellbore instability is critical [7–8].

EXPERIMENTAL SECTION

One promising direction is the development of surfactants based on technical fatty acids obtained from renewable raw materials, which improves the operational properties of drilling fluids while reducing their environmental load. The synthesis of ethanolamide with high efficiency from technical fatty acids was carried out by water removal using the azeotropic distillation method with a phosphoric acid catalyst (NaH_2PO_4) and toluene. This approach allows lowering the reaction temperature, accelerating the process, and increasing the yield of the target product.

A calculated amount of technical fatty acids was loaded into a mixing reactor, and 1–3% (by mass) sodium phosphate (NaH_2PO_4) was added as a catalyst. Then, with constant stirring, monoethanolamine was introduced in a slightly excess amount (1.05–1.1 mol per 1 mol of fatty acid).

To initiate the amidation process, the reaction mixture was heated to 100–110°C. The temperature was then gradually raised to 130–140°C, while water release was monitored. To efficiently remove the produced water, toluene was introduced into the system in an amount of 15–20% of the reaction mixture mass. Toluene forms an azeotrope with water, which is distilled at 110–120°C through a distillation column. The condensate was fed into a phase separator, where the organic layer was returned to the reactor and the aqueous phase removed.

The process continued for 3–4 hours at 130–140°C until the acid number decreased to below 5 mg KOH/g, confirming reaction completion. Afterwards, toluene was removed by vacuum evaporation at 80–90°C.

$$RCOOH + NH_2(C_2H_4OH) \rightarrow RCONH(C_2H_4OH) + H_2O$$

The obtained ethanolamide was cooled to 80–100°C, and any residual acid mixture was neutralized with a sodium hydroxide solution (0.5–1% by mass). The product was then filtered to remove mechanical impurities. The final product is a viscous liquid or paste with high solubility in hydrocarbons and partial solubility in water.

Using NaH_2PO_4 as a catalyst reduces the amidation temperature and accelerates the process, while azeotropic distillation with toluene effectively removes water, preventing ethanolamide decomposition.

The synthesis of a surfactant composition for drilling-fluid emulsifiers was carried out in a thermostated jacketed reactor (1000 cm^3) equipped with a mixer, reflux condenser, and reagent dosing system. Ethanolamide of technical fatty acids (400 g) was loaded into the reactor and preheated to 60–70°C to ensure complete dissolution.

During intensive mixing, 100 g of a concentrated $MgSO_4$ solution (26% at 60°C) was added. The choice of magnesium sulfate is due to its ability to modify the adsorption layer structure and enhance emulsion stability through ionic interactions. As a divalent cation, magnesium strengthens intermolecular bonds between polar surfactant groups, reduces their solubility in the aqueous phase, and promotes better fixation at the interface. This is especially important for stabilizing invert emulsions by reducing droplet coalescence. $MgSO_4$ also regulates viscosity by forming structural interactions with ethanolamide and oxyethylated components.

After complete dissolution of $MgSO_4$, an oxyethylated component (30 g)—a commercially available oxyethylated nonylphenol ("Neonol")—was added at 300–500 rpm to ensure uniform distribution. The temperature was maintained at 50–60°C to prevent thermal degradation.

The next stage involved adding sulfanol (MAX LUXE SERVICE), a highly hydrophilic commercial product. It was introduced gradually (80 g over 15–20 minutes) under constant stirring. To stabilize the composition, small amounts of weak acids or bases were added as needed, maintaining pH within 6.5–8.0.

After all components were added, the mixture was kept at 50°C for 30–40 minutes for homogenization. It was then cooled to 30°C and purified by vacuum degassing to remove volatile impurities and increase storage stability. The final composition was poured into glass or polymer containers. The resulting product is a homogeneous viscous liquid free of sediment and mechanical impurities, suitable for use as a drilling-fluid emulsifier.

RESULTS AND THEIR DISCUSSION

IR spectroscopy is one of the main methods for structural analysis of synthesized surfactants, allowing identification of functional groups and the nature of chemical bonds. The method is based on the absorption of infrared radiation by molecules, resulting in vibrational transitions characteristic of various structural fragments.

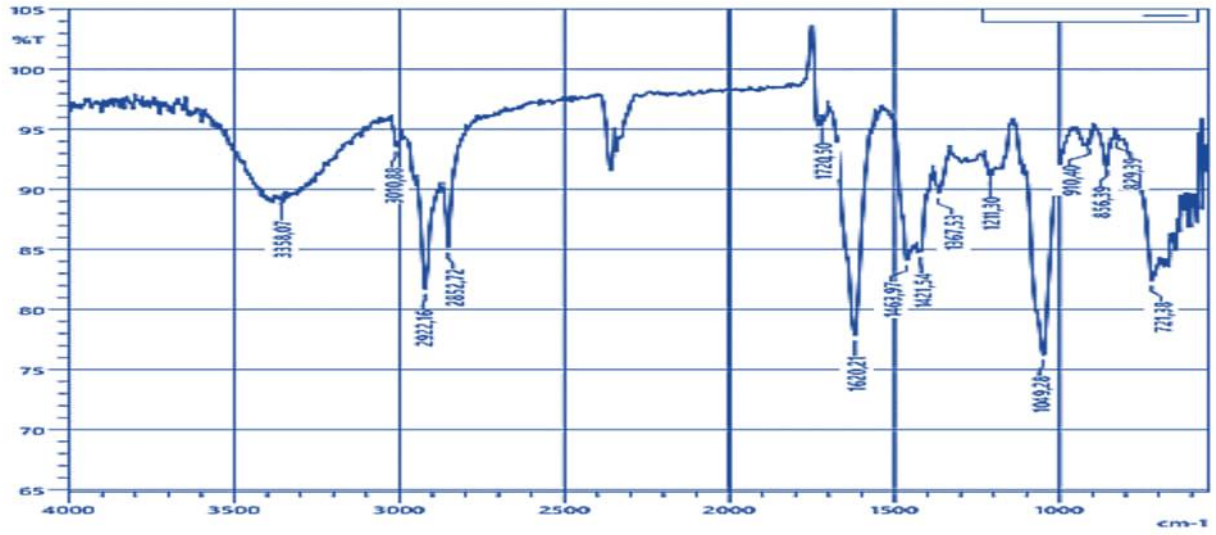

Figure 1. IR spectra of the synthesized surfactants: 1) TFAEA;

The IR spectrum of the synthesized TFAEA makes it possible to identify the main functional groups that confirm its chemical structure. In the region of 3380 cm^{-1}, an intense absorption band is observed, corresponding to the stretching vibrations of hydroxyl (–OH) and amide (–NH) groups, which confirms the presence of ethanolamine residues. The band at 3100 cm^{-1} is associated with associated amide groups or hydroxyl groups involved in hydrogen bonding. The band at 2921–2852 cm^{-1} is characteristic of the stretching vibrations of C–H bonds in alkyl chains of fatty acids and indicates the preservation of the hydrocarbon skeleton of the molecule.

The absorption band at 1724 cm^{-1} corresponds to the stretching vibrations of the carbonyl (C=O) group, confirming the presence of amide structures. The band at 1622 cm^{-1} corresponds to deformation vibrations of the N–H group of the amide fragment, while peaks in the region of 1465–1375 cm^{-1} may be associated with vibrations of C–N and CH_2 groups. Intense bands in the region of 1245–1050 cm^{-1} indicate the presence of C–O and C–N bonds characteristic of ethanolamide structures.

As a result of the research, a method for synthesizing a composition of emulsifiers for emulsion drilling fluids—including ethanolamide of technical fatty acids and additional surfactants—was substantiated and implemented. The composition of the technical fatty acids used as the raw material was analyzed, and their qualitative and quantitative composition was determined.

CONCLUSION

As a result of the conducted research, a method for synthesizing a composition of emulsifiers for emulsion drilling fluids, including ethanolamide of technical fatty acids and surfactants, was substantiated and successfully implemented. Based on the study of the research objects, the composition of technical fatty acids—the initial raw material—was analyzed, and their qualitative and quantitative characteristics were determined.

Chromatographic analysis made it possible to determine the percentage of individual fatty acids in the mixture and calculate their average molecular weight. This allowed an assessment of the properties of the raw materials and optimization of the synthesis conditions to ensure maximum yield and purity of ethanolamide.

A synthesis method for ethanolamide was developed with optimized reaction parameters, resulting in a high degree of conversion to the target product. In addition to ethanolamide, a surfactant composition containing oxyethylated and sulfonated components, as well as magnesium salt, was synthesized.

PROBLEMS OF SEGMENTATION IN THE TASKS OF RECOGNIZING KARAKALPAK TEXT

Uteuliyev N.[1], Kudaybergenov J.[1], Kudaybergenov T.[1], Shixiyev R.[2]
[1]Nukus State Technical University
[4]Karakalpak State University named after Berdakh

Summary: *This article examines the key issues of the segmentation stage in the OCR conveyor for the Karakalpak language in Cyrillic. Specific problems related to the peculiarities of the language's graphics, such as the abundance of diacritical marks, the overlap of symbols in italics, and the low quality of the original images of archival documents, were identified and systematized. Within the framework of the study, a representative dataset of Karakalpak texts was formed, and comparative testing of classical (projection analysis, contour analysis) and modern neural network (U-Net) segmentation methods was conducted. Quantitative results confirmed the low efficiency of classical algorithms (F1-score ~0.55-0.75) and the high effectiveness of the adapted U-Net model (F1-score up to 0.92). A conclusion was made about the prospects of in-depth learning to create robust OCR solutions for the Karakalpak language.*

Key words: *optical character recognition (OCR), segmentation, Karakalpak language, diacritical marks, deep learning, U-Net, image processing.*

Introduction. Digital transformation is one of the priority areas for the development of modern society. In this context, the task of preserving, processing, and ensuring access to textual heritage in national languages is of particular importance. For the Karakalpak language, which is the state language of the Republic of Karakalpakstan within Uzbekistan, the creation of effective OCR technologies is not only a step towards digitalization but also an important tool for preserving cultural and linguistic identity.

A typical OCR conveyor consists of several sequential stages: image pre-processing, segmentation (lines, words, symbols), feature extraction, symbol classification (self-recognition), and post-processing [1]. Numerous studies show that the segmentation stage is one of the most critical: errors made at this stage are transmitted and multiplied in subsequent stages, ultimately leading to a catastrophic decline in the overall accuracy of the system [2]. This is especially true for languages with non-standard or complex graphics.

The Karakalpak language, which uses the Cyrillic graphic base, has a unique set of graphic features that create significant obstacles for segmentation algorithms developed primarily for Russian or English languages. The presence of numerous diacritical marks, the specificity of italics, and often the low quality of digitized historical documents form a complex of problems requiring special study.

The purpose of this study is to identify, classify, and experimentally evaluate specific problems in the segmentation of the Karakalpak text, as well as to conduct a comparative analysis of the effectiveness of classical and neural network methods for overcoming them.

1. Problem statement: The specifics of Karakalpak graphics as a challenge for segmentation.

The Karakalpak alphabet based on Cyrillic includes 33 letters of the Russian alphabet and 9 additional specific symbols: ә, ң, h, ө, ү, i, Ь, ө, ғ. It is precisely this feature that gives rise to most problems.

1.1. Problem caused by diacritical marks.

Diacritical marks (uppercase and lowercase elements) are used to denote specific phonemes. This leads to the following challenges for segmentation:

Merging the diacritic with the main symbol: When printing, especially in low resolution or degradation conditions, the diacritical mark (for example, the dot above "i," "ү" or the tail at "ң") often physically merges with the main symbol. As a result, binarization and contour analysis algorithms perceive such a construction as a single, but complex, coherent component, making it difficult for subsequent normalization and classification.

False segmentation and fragmentation of symbols: Algorithms based on the analysis of vertical projections (Vertical Projection Profile) search for "spaces" - areas with zero or minimal pixel density - to determine the boundaries between symbols. However, the diacritics located separately from the main body of the symbol (as in "ө," "ү") create additional local minimums in the projection. This misleads the algorithm, forcing it to mistakenly "cut" one character into two or even three parts (for example, separately the left diacritic, separately the main part).

The problem of identifying the baseline: Diacritical marks located above the upper line of the line (as in "ў") or below the baseline (as a substring element in "h") distort the overall geometric model of the line. This hinders the correct alignment of symbols and the determination of their support lines, which is an important preparatory step for many segmentation algorithms.

1.2. The problem of italics and handwriting.

Cursive writing predominates in archival documents, books, and manuscripts. For the Karakalpak text, this creates a double problem:

Increasing the sticking effect: In cursive, adjacent symbols are often connected to each other through ligatures and connecting strokes. When such a connecting stroke connects the base symbol and its diacritic or two symbols with diacritics, a complex, difficult-to-separate structure is formed. Classic methods, such as finding bending points or analyzing depressions in projection, often fail to cope with such cases [3].

Writing variability: The writing of the same symbols in a manuscript text varies greatly from person to person. Diacritical marks can be omitted, shifted, or drawn in different sizes, making it impossible to create universal segmentation templates.

1.3. The problem of low quality of source images.

A significant portion of the Karakalpak textual heritage exists in the form of old newspapers, magazines, and books, the print quality of which is far from ideal. Typical artifacts include:

Heterogeneous filling: The settling of typographic ink, creating "broken" and discontinuous contours of symbols.

Background noise: Spots, paper yellowing, scratches that can be mistakenly taken as part of a symbol or, conversely, "break through" its contour.

Low resolution (DPI): Leads to the loss of small details, such as points above "i" or "v," making them indistinguishable for the algorithm.

2. Research Methodology

For a comprehensive study of the identified problems, the following methodology was developed.

2.1. Database Formation

A representative dataset "KaraKalpakText-Seg v1.0" was created, which includes three main categories:

1. Modern printed texts (150 images): Texts typed in text editors using Times New Roman, Arial fonts and the specialized Karakalpak "Qaraqalpaq Times" font. Variability was ensured by changing the size (10-16 pt) and resolution (200-300 DPI).

2. Historical/archival documents (100 images): Scans of newspaper strips ("Yerkin Karakalpakstan") and book pages from the 60s-80s. This category is characterized by medium and high noise levels, and heterogeneous filling.

3. Handwritten texts (50 images): Samples written by 10 different people on white unlined paper, with subsequent scanning.

Each image in the dataset was marked using the LabelImg tool. The marking included:

Word-level:Rectangular bounding boxes for each word.

Character-level: Limiting frames for each individual symbol, including diacritical marks as an integral part of the symbol.

The total number of marked symbols was ~4500 copies.

2.2. Methods of segmentation selected for comparative analysis

Three representative methods covering classical and modern approaches were chosen for the experiments.

Method 1: Segmentation based on projection analysis.

Algorithm: After preliminary processing (binary interpolation, Otsu binarization, morphological noise elimination operations), a vertical projection profile (sum of pixel intensities for each image column) was constructed. Symbol boundaries were defined as local minimums (cavities) in this profile. Profile smoothing using the Gauss filter was used to combat diacritics. Figure 1.

Character boundaries found: 7

Boundary positions: [7 57 81 102 150 174 217]

Expectations: High speed, but low accuracy in text with diacritics and italics.

Method 2: Segmentation based on contour analysis (Connected Components Analysis).

Algorithm: Connected components (contours) were highlighted in the binary image. Then, a series of heuristic rules were applied to filter noise and combine components presumably belonging to a single symbol (for example, based on proximity and alignment along the base line). Horizontal projection analysis was used to find the base line.

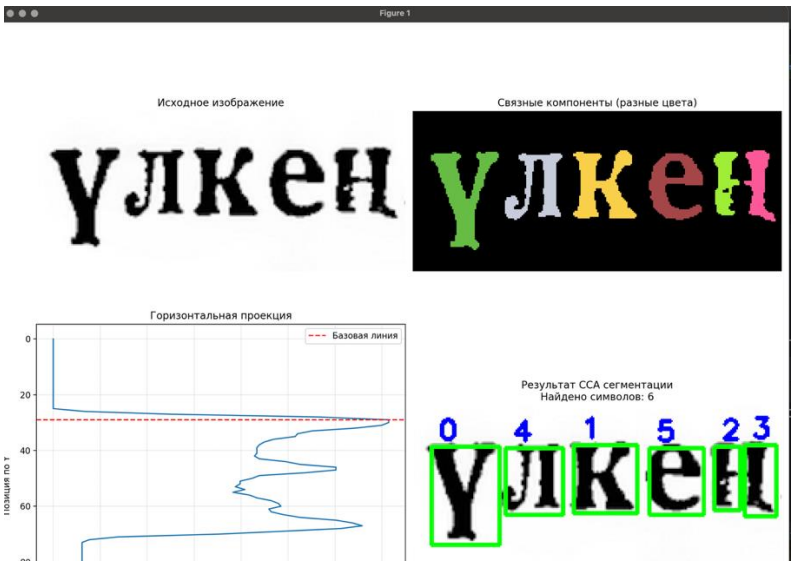

Figure 2.

After filtration, 6 components remained:

After merging: 6 characters

Segmentation details:

Symbol 0: x=12, y=27, w=45, h=65, area=2925

Symbol 1: x=106, y=26, w=42, h=45, area=1890

Symbol 2: x=199, y=27, w=17, h=42, area=714

Symbol 3: x=219, y=26, w=21, h=47, area=987

Expectations: High resistance to diacritics in clean images, but sensitivity to noise and sticking.

Method 3: Neural network semantic segmentation (U-Net Model).

Architecture: A classical U-Net architecture [4] consisting of an encoder (compression path, 5 levels) and a decoder (expansion path, 5 levels) with skip-connections was used. The encoder was initiated by pre-trained weights on ImageNet (backbone - VGG16).

Training: The model was further trained on our dataset. The input images were scaled to 256x256 pixels. The model's output was a pixel mask, where each pixel belonged to one of the three classes: "Background," "Text," "Symbol Boundary." After receiving the mask, the Watershed algorithm was used to highlight individual symbols. Figure 3.

Symbols were found using the U-Net + Watershed method: 5

Comparison of methods:

1. Projection analysis: 7 characters
2. Connected Components: 6 characters
3. U-Net + Watershed: 5 characters

Expectations: The highest accuracy due to the model's ability to learn complex spatial relationships and ignore noise.

2.3. Evaluation metrics

To quantitatively compare the methods, the following metrics were used at the symbolic level:

Precision: The proportion of correctly segmented symbols among all identified by the algorithm.

Recall (Fullness): The proportion of correctly identified symbols in the total number of symbols in the ground truth markup.

F1-score (F-measure): The harmonic mean between Precision and Recall.

Intersection over Union (IoU): The area of the predicted and ground truth limiting frame intersection divided by the area of their union. The symbol was considered correctly segmented at IoU > 0.7.

3. Results and discussion

The results of the experimental comparison of the methods are presented in Table 1.

Table 1. Comparative results of the effectiveness of segmentation methods (F1-score, %)

Dataset category	Projection Method	Contour analysis	U-Net
Printed texts (quality)	75.2	81.5	92.1
Historical documents	55.8	65.3	85.4
Handwritten texts	48.1	58.9	79.7

3.1. Analysis of errors of classical methods

The projection method showed the worst results in all data categories. Qualitative analysis revealed that >65% of errors were directly related to the diacritical marks. The algorithm consistently

"cut" the "ң," "ө," "ү" symbols into 2-3 parts. In manuscript texts, due to irregular spaces between symbols, the method often completely lost word boundaries.

The contour analysis proved to be more robust for diacritics in pure printed texts, correctly identifying the diacritic and the main symbol as a single component. However, on noisy historical documents, adjacent symbols merged into one component, and, conversely, symbols were broken due to printing defects. The heuristic rules for post-processing have shown their limitations and the need for fine-tuning to each type of noise.

3.2. Effectiveness of the neural network approach

The U-Net model demonstrated a statistically significant advantage over classical methods. Analysis of the masks predicted by the model showed that she had successfully learned:

1. Ignore background noise and small artifacts.

2. It is correct to highlight characters with diacritics as unified whole objects, despite the fact that there is a gap between the diacritic and the main body of the symbol in the original image.

3. Separate the sticky symbols in italics by learning from complex examples.

3. Qualitative analysis of residual errors

Despite the high results, U-Net also made mistakes, mainly in the most difficult cases:

Strong physical sticking of 3 or more characters in handwritten texts.

Ink droplets or large spots located close to symbols, which the model sometimes interpreted as part of the text.

Conclusion. During the research, the stated goal was achieved: the problems of segmentation of the Karakalpak text were comprehensively studied and experimentally evaluated. It has been confirmed that the main challenges are related to the graphic features of the language - the abundance of diacritical marks and the prevalence of italic writing in archival materials.

It has been experimentally established that classical segmentation methods (projection analysis, contour analysis) are inadequate for solving the set task, demonstrating low accuracy (F1-score from 48% to 82%) and a high dependence on the input image quality.

As a solution, a deep learning-based approach using the U-Net architecture was proposed and validated. It has been shown that this model is capable of effectively teaching the specifics of Karakalpak graphics, demonstrating high and stable accuracy (F1-score from 80% to 92%) for all data types.

The practical significance of the work lies in:

1. Creation of the first publicly available marked dataset for segmentation of the Karakalpak text.

2. Prove the applicability of modern computer vision methods for low-resource OCR tasks.

3. Defining a clear direction for further research: developing end-to-end neural network recognition systems that take into account the identified features at all stages of the conveyor.

The prospects for further research include expanding the dataset, experimenting with other architectures (e.g., Transformer-based segmentation models), and integrating the proposed segmentation method into a full-fledged OCR system for the Karakalpak language.

FUNDAMENTAL REFORMS IN THE BUILDING MATERIALS INDUSTRY

Eshmuratov M.S., Bektursinova Q.Q., Amatov A.
Karakalpak State University named after Berdakh

Summary: *This article provides information about local construction materials, the President's decrees on the localization of construction materials, and the work being carried out in this area. The implementation of investment projects aimed at localization, meeting domestic demand, and optimizing imports will result in expanding the range of quality products, as well as providing the domestic market with import-substituting and competitive construction materials.*

Key words: *local, building materials, localization, import, optimization, quality, competitive.*

Considering that 55-60% of the cost of construction work consists of building materials and that modern architecture demands new, high-quality, affordable, lightweight, earthquake-resistant, and innovative products, it is not difficult to understand the importance and development of the construction materials industry. Currently, our country is carrying out systematic work aimed at ensuring stable growth in the production and export of competitive products, as well as at modernizing and technically and technologically upgrading enterprises in the construction materials sector.

Special attention is being paid to rapidly developing and diversifying the sector, creating favorable conditions for this, attracting investment in processing local mineral raw materials, and increasing the volume of construction material exports.

Between 2019 and 2025, plans were made to increase the raw material base for the construction industry through geological exploration, extraction, and processing. These include 13.1 million tons of limestone, 1.8 million tons of gypsum, 1 million tons of clay components, brick raw materials, 0.1 million tons of quartz sand, and 5.6 million cubic meters of displaced rocks (basalt), stone, and gravel production.

Production is planned to be increased by:

47 times for wallpaper,

19 times for assembled parquet panels and boards,

15 times for wood-based panels and other wood-like materials,

7 times for aerated concrete blocks,

4 times for paint materials and energy-efficient architectural glass made using float technology,

3 times for basalt composite reinforcement,

2 times for cement.

In the current year, a foundation has been laid for the production of 22 trillion soums worth of construction materials, including:

14.5 million tons of cement,

23 million square meters of construction glass,

60 million square meters of gypsum board,

1 million cubic meters of aerated concrete blocks.

This not only satisfies the domestic market but also opens up opportunities for exports. In the current year, products worth $300 million have been exported to countries like Afghanistan, Azerbaijan, Turkey, Russia, and Ukraine. These include new product types such as basalt rovings, polystyrene boards (penoplex), PVC floor coverings, pigments for paint, and lightweight metal structures.

Due to the implementation of energy-saving technologies, the share of cement production using the dry method increased from 61% to 80%. In glass production, energy consumption has been reduced by half.

Practical implementation has begun on innovative projects aimed at producing modern construction materials from MDF boards, modified aerated concrete, high-quality cement clinker,

polyvinyl chloride (PVC) products, as well as basalt, ash slag, and technogenic waste. It is worth noting that under government scientific programs, 34 research, innovation, and startup projects with a total value of 16.2 billion soums are currently being implemented in the field of construction materials.

Using innovative technologies, new types of energy-efficient, environmentally friendly, export-oriented, and import-substituting construction materials are being introduced. For example, by applying technology to extract asbestos from azbozurite, the amount of asbestos imported into the country can be reduced. This also reduces the production cost of roofing sheets. In the zones of Ohangaron, Kuvasoy, Bekobod, and Angren, 2 million tons of accumulated azbozurite waste can be processed, with up to 15% asbestos content extracted per ton. Preliminary calculations suggest that this could save up to $40 million in asbestos import costs.

MATHEMATICAL MODELING OF FERRORESONANT OSCILLATIONS

Ibadullaev M.[1], **Esenbekov A.J.**[2]
[1]*Tashkent State Technical University*
[2]*Karakalpak State University named after Berdakh*

Summary. *Solving the nonlinear differential equation in computer simulation, the current-voltage and amplitude-frequency characteristics of the ferroresonance voltages are constructed. and also the process of excited ferroresonance of stresses during a change in various.*

Using computer modeling, the volt-ampere and amplitude-frequency characteristics of voltage ferroresonance in a series ferroresonant circuit were constructed and excitation regions were determined depending on changes in various circuit parameters.

Key words*: resistive element, ferroresonant, volt-ampere, monoton, harmonic, measurement.*

Introduction.Self-oscillatory processes in nonlinear electromagnetic ferromagnetic circuits are exceptionally diverse and challenging to study. Many such phenomena are successfully used in stabilizing and frequency-converting systems. On the other hand, the occurrence and prolonged existence of self-oscillations in power supply systems is extremely undesirable, as they cause overvoltage, additional thermal and dynamic stress in electromechanical equipment, false triggering of relay protection, etc. [1,2,3,4,5,6,7,8,9]

To reveal the physical picture of autoparametric processes at the fundamental harmonic of ferroresonance, we will consider a series connection of a coil with a steel magnetic core and a capacitor connected to a sinusoidal voltage.

$u(t)=U_m Sin(\omega t+\varphi)$. Taking the weber-ampere characteristics of the nonlinear inductance.

$$\psi = \alpha i - \beta i^3 \quad (1)$$

This approximation is valid only for $\frac{d\psi}{dt} > 0$ i.e. for $\sqrt{\alpha/3\beta}$.

We assume that the capacitance C and resistance r are known. To construct the current-voltage (CVCH) and amplitude-frequency (AFCH) characteristics of the circuit, we use the harmonic balance method. In the first approximation of the method, we consider only the first harmonic of all periodic quantities in the circuit and assume the current to be equal to: $i(t)=I_m \sin\omega t$ of the current in accordance with (1) flux linkage.

$$\psi(t)=(\alpha I_m - 0{,}75\beta I_m^3)\sin\omega t + 0{,}25\beta I_m^3)\sin 3\omega t$$

The circuit equation is written as: $\frac{d\psi}{dt} + ri + \frac{1}{C}\int idt = u(t)$ or after substituting the values of i:

$$\left(\alpha\omega - \frac{1}{\omega C} - 0{,}75\beta I_m^2\right) I_m cos\omega t + rI_m sin\omega t + 0{,}75\omega\beta I_m^3 cos 3\omega t = u(t) \quad (2)$$

Neglecting the third higher harmonic of the input voltage, we represent: $u(t)=U_m \sin(\omega t+\varphi)=U_a \sin\omega t+U_b \cos\omega t$,

Where $U_m=\sqrt{U_a^2 + U_b^2}$; $\varphi = arctg\frac{U_b}{U_a}$.

After substituting u(t) into (2), we equate the coefficients of the same trigonometric functions in the left and right parts, squaring and adding them together, we obtain the equations for the CVCH and AFCH of the circuit:

$$\left[\left(\alpha\omega - \frac{1}{\omega C} - 0{,}75\beta I_m^2\right)^2 + r^2\right] I_m^2 = U_m^2 \quad (3)$$

We assume ω=const and construct the relationship between $U_m=f(I_m)$ using equation (3).

We denote $\alpha\omega - \frac{1}{\omega C} = \xi$ and, for definiteness, set $\xi>0$. The current-voltage characteristic equation takes the form:

$$\sqrt{(\xi - 0{,}75\beta I_m^2) I_m^2 + (rI_m)^2} = U_m \quad (4)$$

Voltage U_m is the geometric sum of the voltages on the reactive and resistive parts of the circuit.

Ferroresonance corresponds to zero reactive voltage component $\xi - 0{,}75\beta I_m^2 = 0$; thus, resonance occurs at current values

$$I_{m0} = I_0 = \sqrt{\xi/0{,}75\beta\omega} \quad (5)$$

At r=0, the current-voltage characteristic is a cubic parabola, depicted as curve "a" in Fig. 1 (the coordinate axes represent the absolute values of the current and voltage amplitudes). At currents lower than I_0, the circuit is inductive; at higher currents, it is capacitive.

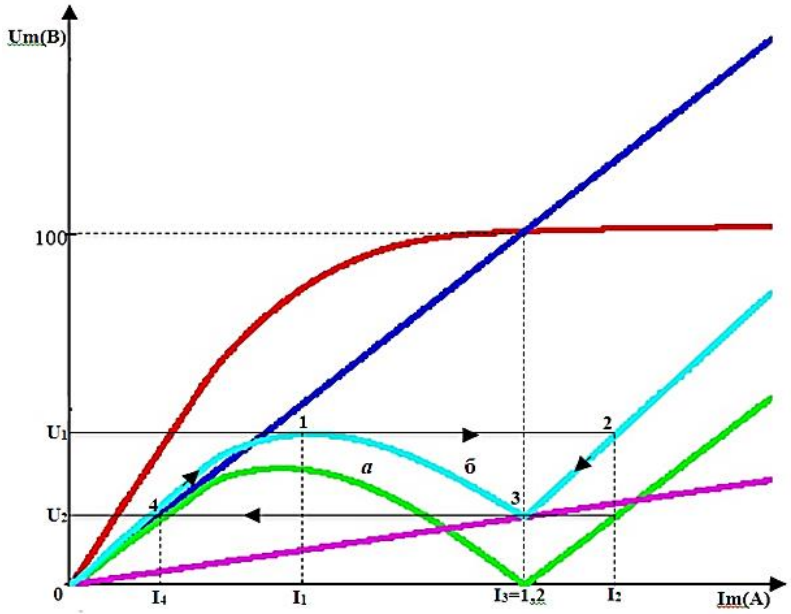

Fig. 1. Volt-ampere characteristics of voltage ferroresonance

If there are losses in the circuit, the voltage on the resistive element is added to the total voltage on the reactive elements, therefore the current-voltage characteristic Um(Im) (curve “b” in Fig. 1) passes above the characteristic of the circuit without losses.

The current-voltage characteristic has a voltage range from U_1 to U_2, where one voltage value U_m corresponds to three steady-state current values I_m. When the circuit is powered by an EMF source, this region represents a region of ferroresonant current amplitude jumps. With a smooth increase in voltage from zero at a value of $U_m = U_1$, the current increases abruptly from the value of I_1 to I_2; with a decrease in voltage to $U_m = U_2$, the current decreases abruptly from I_3 to I_4.

Clearly, all current values lying on branches 1–3 of the volt-ampere characteristic with a negative derivative $\partial U_m/\partial I_m$ (the falling section or the section with a negative slope) are unstable when the circuit is powered from an EMF source. The volt-ampere characteristic can only be fully measured when the circuit is powered from a current source.

At low resistances r≈0, the minimum point of the current-voltage characteristic corresponds to the ferroresonance current I_0. As the resistance increases, the minimum of the characteristic shifts to the left of the resonance point. This is evident from the expression for the extrema of the current-voltage characteristic:

$$I_{m\,\text{экстр}}^2 = \frac{2\left(2\xi \pm \sqrt{\xi^2 - 3r^2}\right)}{9\beta}, \quad (6)$$

where the positive sign before the root corresponds to the minima, and the negative sign corresponds to the maxima of the characteristic. It is clear that as the resistance r increases, the expression under the root decreases, and, consequently, the current corresponding to the minimum voltage decreases. When $r > \xi/\sqrt{3}$ the volt-ampere characteristic becomes monotonic ferroresonant jumps are absent in this mode.

In the presence of resistance r, the voltage $u(t)$ at resonance is equal to

$$u(t) = rI_m sin\omega t + 0{,}75\omega\beta I_m^3 cos3\omega t.$$

The presence of higher harmonics affects the accuracy of experimental measurements.

In equation (3), we fix the voltage U_m and plot the dependence of the current I_m on the frequency ω:

$$I_m = U_m / \sqrt{\left(\alpha\omega - \frac{1}{\omega C} - 0{,}75\omega\beta I_m^2\right)^2 + r^2}. \quad (7)$$

At low voltages and low currents, the value of $0{,}75\omega\beta I_m^2$ in the denominator (7) can be neglected, and the equation will take a form similar to the equation of a linear series resonant circuit with a resonant frequency $\omega_0 = 1/\sqrt{\alpha C}$. This characteristic is shown in Fig. 2 (curve "a"). With an increase in the amplitudes U_m and I_m, the resonant frequency determined by the condition increases:

$$\omega_{рез} = \frac{0{,}375\beta I_m^2}{\alpha} + \sqrt{(0{,}375\beta I_m^2/\alpha)^2 + \omega_0^2}. \quad (8)$$

The dependence of the resonant frequency on current is shown in Figure 2 by the dotted line. The amplitude-frequency characteristics are the same as for a linear circuit, that is, they are located symmetrically with respect to the resonant frequency. The appearance of the amplitude-frequency characteristic at a sufficiently high voltage is shown by curve "b" in Figure 2. This characteristic has a region where one frequency value corresponds to three current values. This region represents the region of ferroresonant current amplitude jumps. With a smooth increase in frequency to values $\omega>\omega_2$ the current abruptly decreases from I_1 to I_2. With a decrease in frequency to $\omega<\omega_1$ the current increases from I_3 to I_4. Clearly, all current values lying in the range 1-3 of the characteristic are unstable.

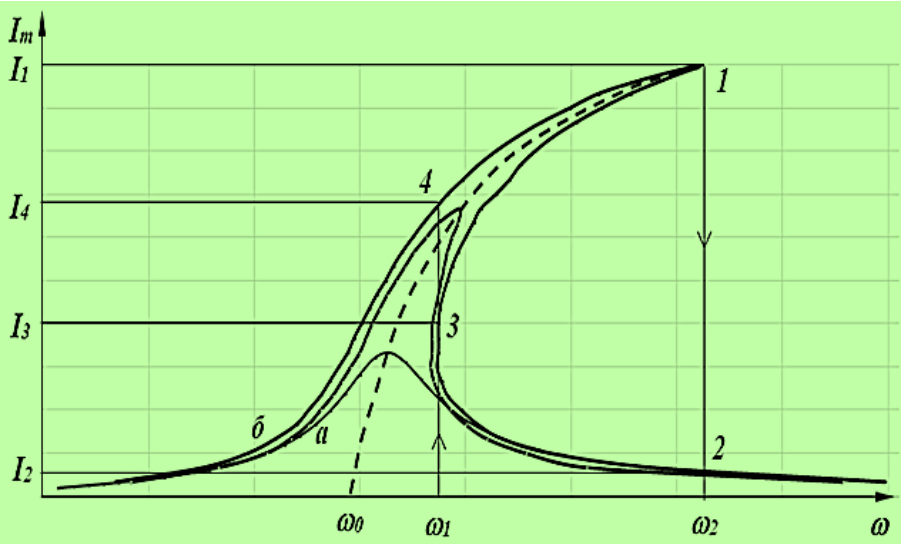

Fig. 2. Amplitude-frequency characteristics of ferroresonant voltage

The current-voltage characteristic in Fig. 1 corresponds to a frequency lying in the range from ω_1 to ω_2. They can also be plotted graphically.

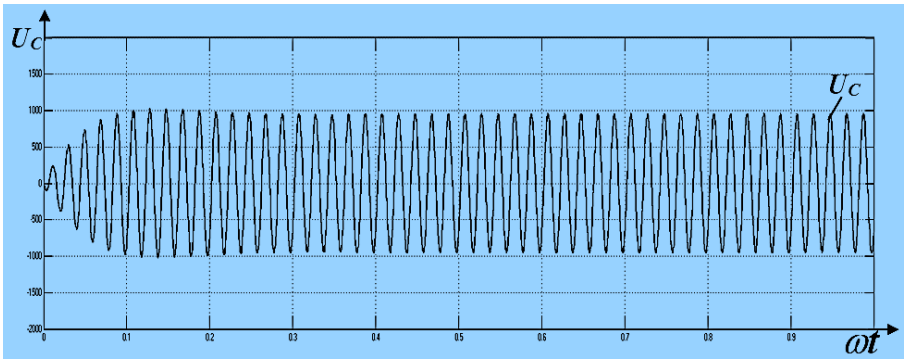

Fig. 3. Dependence of U_C on t during the excitation of voltage ferroresonance

The excitation process of voltage ferroresonance with changes in the input voltage U and circuit parameters was studied using a computer model. The volt-ampere characteristics according to equation (3) at U_{in} = 150 V; R = 0.10 Ohm; X_c = 50 Ohm are shown in Fig. 1. It follows that ferroresonance in the circuit occurs at U_L=U_C= 90 V and I=1.2 A. The oscillogram of the ferroresonance curves of the voltage across the capacitor is shown in Fig. 3. According to (7), the amplitude-frequency characteristics are plotted for a change in capacitance of 16÷50 μF (Fig. 2).

Conclusions. *Using computer modeling, the volt-ampere and amplitude-frequency characteristics of voltage ferroresonance in a series ferroresonant circuit were constructed and excitation regions were determined depending on changes in various circuit parameters.*

STUDYING THE STABILITY AND REOLOGICAL PROPERTIES OF INVERT EMULSIONS OF VARIOUS SURFACE-ACTIVE SUBSTANCES

Kosnazarov K.K.
Karakalpak State University named after Berdakh

Summary: *The basis of an effective emulsion drilling fluid is surfactants, which play a key role in stabilizing emulsions and controlling their structural and mechanical properties. Modern research is aimed at creating new emulsifiers with improved rheological characteristics, high resistance to thermobaric effects, and compatibility with various chemical reagents. One of the promising directions is the development of surfactants based on technical fatty acids obtained from renewable raw materials, which allows not only to improve the operational properties of drilling fluids but also to reduce their environmental burden.*

This article examines modern approaches to the creation and application of emulsifiers for drilling fluids, and also analyzes literature data on the mechanisms of emulsion stabilization, the influence of emulsifier composition on the rheological and colloidal-chemical properties of drilling fluids. Separate data on research aimed at optimizing the composition of emulsion systems and increasing their efficiency under deep and ultra-deep drilling conditions are presented.

Key words: *diesel fuel (DF), kinematic viscosity (ηk), density (ρ), flash point (FP), thickening point (TP), acid number (AN), sulfur content (SC), water content (WC), static shear stress (SSS), oil/water (O/W), ethanolamide of technical fatty acids (EATFA).*

INTRODUCTION

Emulsion drilling fluids are widely used in the oil and gas industry due to their ability to ensure high wellbore stability, reduce filtration losses, and improve the lubricating properties of the system. The use of such solutions is especially relevant when drilling in complex geological conditions, where it is necessary to minimize the hydration of clay rocks and reduce the likelihood of complications associated with the instability of well walls.

The drilling fluid is a complex dispersed system consisting of suspensions, emulsions, and gas-filled liquids. Its selection is determined by geological conditions, the temperature-pressure characteristics of the well, and the type of deposit being developed. Since the drilling fluid directly contacts the rock, its properties play a key role in ensuring wellbore stability and preventing complications [1; P. 109-114, 2; P. 52-56].

Optimal solution parameters are selected based on geological and technical data and experience in operating similar deposits [3; P. 138-142, 4]. The mismatch between the solution characteristics and the drilling conditions can reduce process efficiency, increase costs, and create hazardous situations. For example, insufficient cleaning of the wellbore is often associated with improper rheological characteristics or the filtration capacity of the solution. Other common complications include slimming, tool seizures, wall stability disruption, circulation loss, and cementation problems, which emphasizes the need for precise selection and control of the solution composition [5; P. 92-98].

The stability of the drilling fluid is determined by kinetic and colloidal-chemical factors, including the size and mineralogical composition of the particles, the concentration of the dispersed phase, the presence of electrolytes and surfactants, and temperature conditions. For example, a high degree of dispersity contributes to the stability of the system by reducing particle aggregation, while the addition of electrolytes and surfactants can alter the charge balance, causing coagulation. Increasing the temperature, in turn, reduces the solution's viscosity, which can also affect the suspension's stability [6; P. 187-189, 7; P. 30-39].

Structure strength and effective viscosity are key parameters that determine the rheological properties of clay drilling fluids. Structure strength is responsible for holding solid particles in a suspended state, preventing them from settling, and ensuring a uniform consistency of the solution, which is critical for protecting well walls [8; P. 5-100].

Effective viscosity, in turn, affects the lubricating properties of the solution and its ability to form a protective rheological structure, reducing the friction of the tool against the wellbore walls and preventing rock erosion.

Precise control of rheological characteristics is essential for efficient drilling, as it allows for the optimization of equipment operation and minimizes the risk of complications [9; P. 18-45]. Incompatibility of the viscosity or strength of the structure can lead to tool clogging, circulation disruption, or other emergency situations. To control these parameters, reagents are used that contribute to the dispersion of the solid phase and stabilization of the solution due to the change in the charge balance of the particles [9; P. 20-21].

Drilling fluids are multicomponent dispersed systems consisting of suspensions, emulsions, and gas-saturated fluids adapted to specific drilling conditions. They are used in the development of oil, gas, and other minerals, ensuring efficient cleaning of the wellbore and protection of the geological section. Depending on the operating conditions, water, hydrocarbon, emulsion, and gaseous systems are used [10].

EXPERIMENTAL SECTION

The choice of hydrocarbon dispersion medium is a key factor in creating invert emulsions for drilling fluids. Basic oils used as a dispersion phase significantly affect the rheological properties, system stability, environmental safety, and technological effectiveness of the drilling fluids. The chemical nature of hydrocarbons determines their viscosity, wetting ability, interaction with surfactants, and resistance to thermal and mechanical loads.

Modern invert emulsions are mostly based on synthetic and mineral oils, diesel fuel, and hydrocarbons with controlled molecular composition.

The introduction of synthetic hydrocarbons allows for improving the environmental performance of drilling fluids by reducing the content of aromatic compounds and toxic impurities. At the same time, mineral oils and diesel fuel have high compatibility with various surfactants, which ensures effective emulsion stabilization.

To create emulsion drilling fluids, oil and diesel fuel (DF) were studied. Their key characteristics, such as kinematic viscosity (ηk), density (ρ), flash point (FP), thickening point (TP), acid number (AN), sulfur content (SC) and water content (WC), have been determined, as they directly affect the stability and operational properties of the drilling fluids.

Kinematic viscosity determines the oil's fluidity and influences the rheological characteristics of the emulsion. The density affects the retention of solid particles and the pressure of the drilling fluid column. Flash point characterizes fire safety and operational limitations at high temperatures. Thickening temperature is important for preventing phase transitions in low-temperature conditions. The acid number reflects the presence of acidic impurities that can affect surfactants and equipment.

The sulfur content affects the corrosive activity and environmental characteristics of the solution. The presence of water determines the oil's tendency to phase transformations and its stability in the emulsion composition.

All operations were performed at room temperature. The obtained system underwent visual and rheological assessment for stability, thixotropy, and resistance to stratification.

Main methods for determining the characteristics of emulsion drilling fluids

The parameters of the drilling fluid were determined in accordance with the international standard ISO 10414-2, which regulates field tests of hydrocarbon-based drilling fluids.

Determination of the solution density was performed using lever scales. Before starting measurements, the scales were calibrated using fresh water at 21°C with a density of 1.00 g/cm^3. Calibration was carried out by adjusting the lead shot on the balance beam or adjusting the balancing screw until the required value was obtained.

The density measurement procedure included several stages. First, the solution temperature was determined and recorded. Then, the test drilling fluid was filled into the scale cup, after which it was sealed tightly with a lid. The excess solution was removed through a hole in the lid, after which the outer surface of the cup was thoroughly wiped. The cup was placed on the prism, and the runner

on the graduated kingpin was moved until equilibrium was reached. The density value was calculated from the left side of the runner and recorded with an accuracy of 0.01 g/cm^3.

After each measurement, the drilling fluid was poured into a container for collecting an average sample, and the scales were cleaned and dried. To improve measurement accuracy, all equipment parts must remain clean and dry.

Determination of the viscosity and limiting static shear stress was carried out at 50°C using a rotary viscometer with a thermostated ring and a thermometer.

The sample was heated to 50°C with a stirring of 600 rpm. After temperature stabilization, viscometer readings at 600 and 300 rpm were recorded. Plastic viscosity was determined as the difference in values at 600 and 300 rpm, dynamic shear stress - by the difference in the value at 300 rpm and plastic viscosity with subsequent multiplication by 4.78. The apparent viscosity was calculated as half the value at 600 rpm.

The limiting static shear stress (SSS) was measured 1 and 10 minutes after stopping stirring at a speed of 3 rpm. The results were calculated as the maximum deviation multiplied by 4.79.

After testing, the device and its components were cleaned and dried to prevent contamination and extend the equipment's service life.

Retort testing allows for the determination of the water, oil, and solid phase content in the drilling fluid sample when heated in a sealed chamber. These data are important for controlling the phase ratio, rheology, density, and filtration of the solution, as well as for evaluating the equipment designed to remove solid particles.

The test consisted of heating 100 cm^3 of the solution in a retort unit, evaporating the liquid components, and condensing them, followed by measuring the volumetric fractions of water and oil. The solid phase was calculated based on the difference between the initial solution volume (100 cm^3) and the sum of the volumes of condensed liquids (V_I).

Before starting the test, the sample was thoroughly mixed to ensure homogeneity and prevent air from entering, which could lead to an overestimation of the solid phase. The solution was carefully poured into the retort cup, avoiding air bubbles. The chamber was filled with metal wool for uniform evaporation, sealed tightly, and then heated for 45 minutes. After cooling, the volumes of separated liquids were measured.

The volume shares were calculated as follows:

The oil/water ratio was determined by the formula:

$$O/W = \frac{V_O}{V_m + V_W} * 100\%$$

Volume fraction of oil:

$$O_{\%} = \frac{V_m}{V_\text{p}} * 100\%$$

Volume fraction of water:

$$\text{B}_{\%} = \frac{V_W}{V_\text{p}} * 100\%$$

Volume fraction of the solid phase:

$$100 - (V_m + V_W)$$

The water yield of the drilling fluid was determined using the VM-6 instrument. The test consisted of filtering the solution under 0.7 MPa pressure through filter paper for 30 minutes. The volume of the filtered liquid was measured and fixed. This parameter characterizes the solution's ability to retain water, which is important for preventing soil dilution and stabilizing the well.

The conditional viscosity of the drilling fluid was measured using a VBR-2M viscometer. The method is based on the time it takes for 500 ml of a solution to flow through a calibrated capillary at a given temperature. The viscosity was calculated using the formula:

$\eta = t/T_0$,

where t is the flow time of the solution, sec, T_0 is the flow time of the water.

RESULTS AND THEIR DISCUSSION

Study of the change in the main stability characteristics of an emulsion based on diesel fuel

Studying the stability of diesel fuel-based emulsions is an important stage in the development of drilling fluids used in complex geological conditions. Emulsion stability determines its ability to maintain phase homogeneity, preventing coalescence and separation, which is critical for the stability of the drilling fluid at high temperatures and pressures. Diesel fuel is widely used as a dispersion medium in invert emulsions due to its accessibility, low polarity, and good lubricating properties. Studying the influence of various factors, such as the concentration of emulsifier, mineral filler, and aqueous phase, allows for the determination of optimal conditions for preparing stable emulsions that ensure the effective operation of drilling fluids.

Table 1.

Characteristics of DF emulsions (3% asphaltene) + $CaCl_2$ solution + EATFA (25/73/2) depending on the $CaCl_2$ solution concentration

№	$CaCl_2$ solution concentration	Density, g/cm^3	T, s	DV at 300 rpm, mPa*s	ES, B	TC at 80°C, h
1	1,5	1,01	29	156	26	≥8
2	12,5	1,12	51	178	49	≥8
3	30	1,22	108	186	71	≥8
4	38,5	1,23	121	227	80	≥10

Analyzing the data in Table. 1, the influence of calcium chloride solution concentration on the main stability characteristics of emulsions containing diesel fuel (DF), $CaCl_2$ solution, and ethanolamide of technical fatty acids (EATFA) in a ratio of 25/73/2 can be identified.

With an increase in the concentration of $CaCl_2$ solution, a regular increase in emulsion density is observed, which is explained by the high solubility of calcium chloride and its high density. The density of the system increases from 1.01 g/cm^3 at a $CaCl_2$ concentration of 1.5% to 1.23 g/cm^3 at a calcium chloride concentration of 38.5%.

The duration of leakage (T, s) increases significantly with increasing $CaCl_2$ concentration, indicating an increase in the structure of the system. At a minimum concentration (1.5%), the drainage time is 29 s, while at 38.5% it is 121 s. This indicates an intensification of coagulation interactions between the particles of the dispersed phase, leading to an increase in the viscosity and strength of the emulsion structure.

Dynamic viscosity at 300 rpm (DV) also shows growth as $CaCl_2$ concentration increases. At a minimum solution concentration (1.5%), the PV is 156 mPa·s, and at 38.5%, it reaches 227 mPa·s. This is explained by the increase in the electrolytic activity of the aqueous phase, leading to increased interfacial interactions and increased viscosity.

The electrical stability (ES) of emulsions increases from 26 V at 1.5% $CaCl_2$ to 80 V at 38.5% $CaCl_2$, confirming the increase in the stability of the interfacial film. High electrical stability indicates effective adsorption of surfactants at the interface, which prevents water globule coalescence and contributes to system stabilization.

Thermal stability (TS) at 80°C is ≥8 hours at low concentrations of $CaCl_2$, however, at 38.5%, an increase to ≥10 hours is observed. This indicates that increasing the electrolyte concentration contributes to the heat resistance of the system, reducing the probability of separation.

The influence of the oil and water phase ratio (O/W) and the consumption of surfactants on the colloidal stability of the emulsion was studied. As a dispersion medium, a mixture of diesel fuel and asphaltene with a 3% content was used, which ensured an improvement in the structural-rheological properties and stability of the system. The obtained data are presented in Figure 1. The $CaCl_2$ content in the solution is 12%.

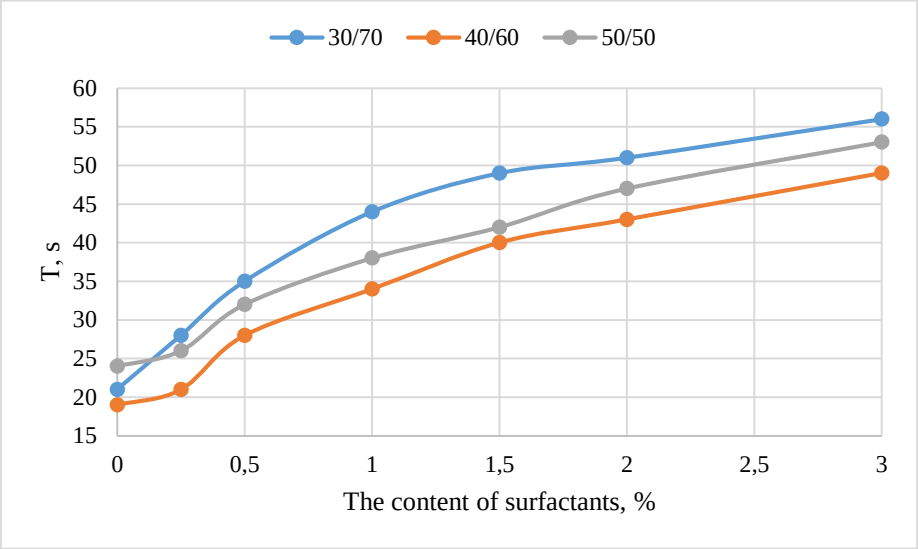

Fig. 1. Change in the conditional viscosity of emulsions with different O/W ratios depending on the EATFA content (3% asphaltene).

Analysis of the data presented in Figure 1 shows a regular change in the conditional viscosity of the emulsion system depending on the concentration of EATFA and the ratio of oil and water phases. At a ratio of 30/70 (with a predominance of the aqueous phase), the initial viscosity is minimal - 21 s, and with an increase in the concentration of surfactants, it gradually increases to 56 s with a maximum surfactant content (3%). In a 60/40 ratio, the initial viscosity is lower (19 s), but the increase in viscosity occurs more smoothly, and at 3%, it reaches 49 s. In a 50/50 ratio system, the initial viscosity is somewhat higher (24 s), but the further increase in the parameter is less pronounced compared to 30/70 and at 3 is 53 s.

The difference in viscosity dynamics when the phase ratio changes is due to a number of factors. In a system with a high content of the water phase (30/70), water droplets are less structured, which contributes to an increase in the system's fluidity. As the concentration of surfactants increases and the stabilization of water globules increases, a significant increase in viscosity is observed due to the formation of a denser interfacial layer.

With an increase in the oil phase proportion (60/40 and 50/50), more stable emulsions are created, in which water globules are dispersed in the oil. In these systems, the increase in viscosity with an increase in the concentration of surfactants is less pronounced, as oil reduces internal friction in the system to a greater extent.

In water-oil emulsions, the high concentration of the water phase (30/70) contributes to the formation of smaller droplets, which reduces the initial viscosity. However, when surfactants are introduced, water droplets form dense associates, which significantly increases the flow resistance.

With a higher oil phase content (60/40 and 50/50), a lower increase in viscosity is observed, as the oil dispersion medium contributes to a decrease in the intermolecular interaction between water particles and surfactants, thereby limiting the influence of globule structure.

Thus, with a predominance of the aqueous phase, the initial viscosity is lower, but with an increase in the concentration of surfactants, the viscosity increases faster due to the dense interfacial layer. In systems with a high oil phase content, the viscosity is more stable and increases more slowly, which is related to the greater role of the dispersion medium in the formation of the rheological properties of the emulsion.

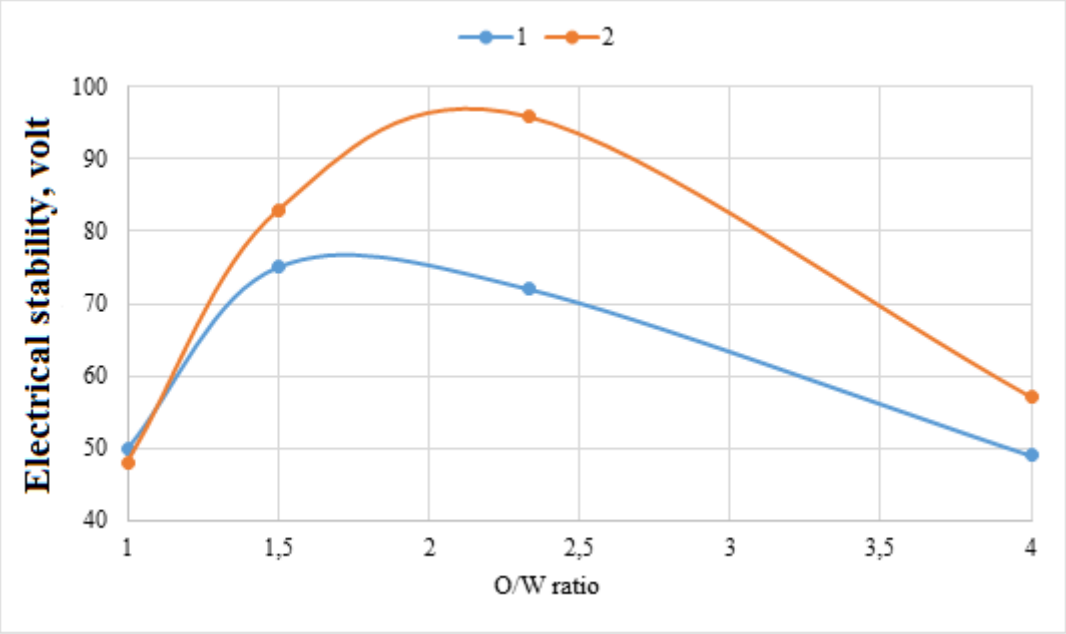

Fig. 2. Change in electrical stability depending on the W/O ratio at different EATFA content, %: 1) 1; 2) 2 (3% asphalt).

Analysis of the electrical stability of emulsions at various oil and water phase ratios (O/W) and surfactant content (1 and 2%) shows that the stability of the system depends on the phase ratio and the concentration of the surfactant.

At a ratio of W/O=4 (O/W = 20/80, high water content), the electrical stability is 49 V at 1% surfactant and 57 V at 2% surfactant. Such a low value is due to the excess water phase, which contributes to the formation of large droplets and their coalescence. In such systems, stability is determined by the strength of the interfacial layer, which weakens with high water content.

With an increase in the ratio to 30/70, the electrical stability increases significantly (72 V at 1% surfactant and 96 V at 2% surfactant). This indicates that at this ratio, an optimal balance between the dispersed and continuous phases is achieved. The surfactant is evenly distributed at the interface of the phases, forming a dense stabilizing layer.

With a further increase in the oil phase content (40/60), the electrical stability continues to increase, but not so sharply (75 V at 1% surfactant and 83 V at 2% surfactant). This is because, with such a ratio, a stable system is formed, but a decrease in the concentration of the aqueous phase leads to a decrease in the number of water globules, which limits the growth of electrical stability.

With a further increase in the oil phase to 50/50, a decrease in electrical stability is observed (50 V at 1% surfactant and 48 V at 2% surfactant). This is because the decrease in the aqueous phase leads to the rarefaction of the system, a decrease in the number of water globules, which worsens the electrical conductivity of the emulsion. In addition, with a high oil phase content, water dispersion deteriorates, which also reduces electrical stability.

Thus, the highest electrical stability is observed at a ratio of 30/70, when an optimal stable system is formed. With further increase in the oil phase, the electrical stability decreases, which is associated with a decrease in the amount of the dispersed phase and a deterioration in the distribution of surfactants.

To assess the influence of different types of emulsifiers on the rheological characteristics and stability of inverted emulsions, comparative studies of systems based on diesel fuel and calcium chloride solutions with the addition of 2% neonol were conducted. The main attention was paid to the key parameters of emulsions, such as conditional viscosity, dynamic viscosity at 300 rpm, electrical stability, and thermal stability at 80°C.

Analysis of the results shows that with an increase in the concentration of calcium chloride solution, a regular increase in the conditional viscosity, dynamic viscosity, and electrical stability of

emulsions is observed, which is due to the strengthening of ionic interactions and stabilization of the oil/water interface. However, the obtained values of electrical and thermal stability are significantly inferior to the indicators of emulsions based on ethanolamide of technical fatty acids, which indicates a less dense packing of neonol molecules at the interface and a lower stability of the interfacial layers.

Comparison with ethanolamide emulsions of technical fatty acids shows that the conditional and dynamic viscosity of neonol emulsions is lower than that of similar ethanolamide systems at the same concentration of the aqueous phase. This is because neonol forms less rigid adsorption layers at the interface compared to amide surfactants. The electrical stability of neonol emulsions is also lower, especially at low concentrations of calcium chloride, which confirms that neonol reduces water droplet coalescence less effectively, leading to a decrease in emulsion stability. The thermal stability of emulsions with neonol does not exceed 6 hours, while for systems based on ethanolamide of technical fatty acids, this indicator was higher, indicating a less stable structure of the stabilized interfacial layer.

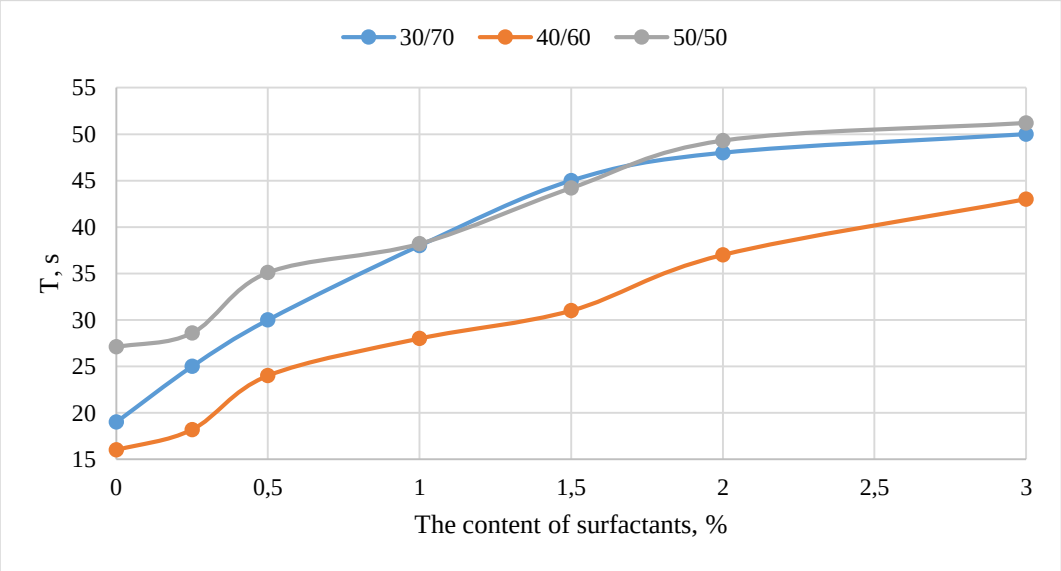

Fig. 3. Change in the conditional viscosity of emulsions with different O/W ratios depending on the Neonol content (3% asphaltene).

A comparative analysis of the change in conditional viscosity at different oil and water phase ratios shows that the introduction of surfactants has a similar effect on the rheological properties of the system, however, when using neonol, certain differences are observed compared to EATFA.

In all systems, the increase in the concentration of surfactants leads to an increase in conditional viscosity, which is associated with the strengthening of interfacial boundaries and a decrease in the size of water globules. However, the nature of the viscosity change when using neonol differs from the EATFA system. In particular, at all oil and water phase ratios, the absolute values of the conditional viscosity with neonol are lower than in similar EATFA systems.

For the 30/70 system with a 1% surfactant content, the viscosity is 38 s, which is lower than the values for the EATFA system, where it reached 44 s at the same concentration. This indicates a lower effectiveness of neonol in forming a stable interfacial layer, which is related to its molecular structure and a lower ability to form strong associates at the interface of the phases.

A similar trend is observed in the 40/60 system, where at all concentrations of surfactants, the viscosity is lower than in the EATFA system. This confirms that neonol forms less dense interfacial layers, leading to a decrease in the stability of the emulsion structure.

The greatest differences are observed in the 50/50 system, where at low concentrations of surfactants, the conditional viscosity with neonol is higher than with EATFA (27.1 versus 24 s with 0% surfactant), however, with an increase in the content of surfactant, the increase in viscosity slows down, and at 3% surfactant, the viscosity is lower than in the system with EATFA (51.2 versus 53 s).

This indicates that neonol at high concentrations less effectively regulates the system, unlike EATFA, which demonstrates a more linear increase in viscosity.

Thus, the use of neonol leads to a less pronounced increase in the viscosity of the emulsion system compared to EATFA, which indicates its lower adsorption capacity at the interface and a weaker effect on the emulsion structure. This can be a limiting factor when neonol is used in drilling fluid formulations, where more stable rheological characteristics are required.

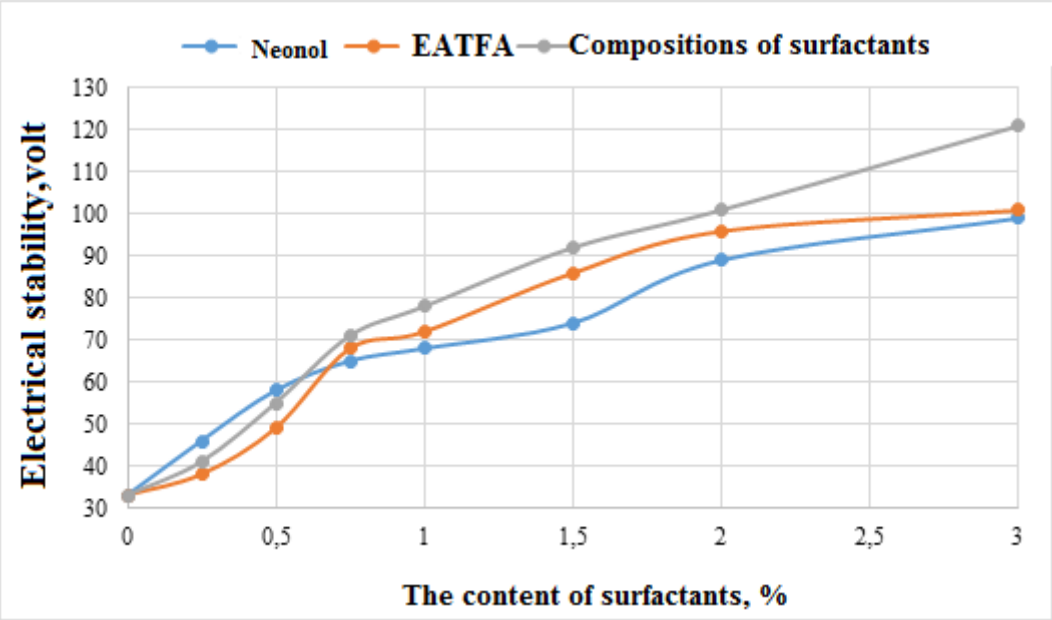

Fig. 4. Changes in the electrostability of DF+$CaCl_2$ solution (30/70) emulsions depending on the content of various surfactants (3% asphaltenes).

Analysis of the dependence of ES on the concentration of surfactants in emulsion systems using various emulsifiers - neonol, EATFA and compositions of surfactants - allows for the determination of their influence on the stability of emulsions. With an increase in the concentration of surfactants, an increase in electrical stability is observed, which is associated with improved adsorption of surfactant molecules at the interface, the formation of a denser interfacial layer, and a decrease in the coalescence of water globules. In the concentration range up to 0.75%, the difference between ES for all systems is minimal, however, starting from a 1% concentration of surfactants, surfactants begin to exhibit higher ES values compared to EATFA and neonol.

With a 1.5% compositions of surfactants content, it is already 6% more effective than EATFA and 18% more effective than neonol, which indicates stronger stabilizing properties of the composite emulsifier. In the range of 2-3%, compositions of surfactants exhibits a significant excess of ES, reaching 121 V, while for EATFA and neonol, this indicator is 101 V and 99 V, respectively.

The high effectiveness of the composite emulsifier is explained by the combined effect of its components: the metal salt improves the stability of the interfacial layer by reducing the coalescence of water droplets, and the oxyethylated compounds and ethanolamide TFA acids provide effective adsorption and stabilization due to optimal hydrophilic-lipophilic balance. Thus, the use of surfactants allows for obtaining the most stable system with a lower emulsifier cost, making it promising for use in drilling fluids.

The study of the influence of various types of surfactants on the electrical stability of emulsions showed that composite surfactants provide the highest stability of the system compared to individual emulsifiers. The increase in the concentration of surfactants contributes to an increase in the stabilizing effect due to dense adsorption at the interface between the phases and prevents the coalescence of water globules. The composite emulsifier exhibits a higher level of electrical stability, especially at concentrations above 1%, which is due to the synergistic effect of its components, which

contribute to the creation of a strong interfacial layer. The obtained results confirm the feasibility of using surfactants to improve the operational characteristics of emulsion drilling fluids.

CONCLUSION

As a result of the conducted research, the main regularities of changes in the stability of emulsions based on diesel fuel and oil depending on the phase ratio, the type of surfactants, and the presence of calcium chloride were established. It has been shown that with a decrease in the oil and water phase ratio (O/W), the conditional viscosity increases, especially when using composite surfactants. Thus, in the oil/water system, at O/W = 0.25, the conditional viscosity reaches 55 s for surfactants, 37 s for neonol, and 36 s for EATFA, while in the absence of surfactants, it remains at 14 s. In the presence of a 12.5% $CaCl_2$ solution, the viscosity increases to 62 s for surfactants, 51 s for neonol, and 46 s for EATFA, which indicates the strengthening of the interfacial layer structure due to ionic interactions.

***Summary**: This paper proposes a **conceptual model** for the objective assessment of **employee engagement** in the service industry (e.g., education, healthcare) using **Affective Computing** technologies. Unlike subjective surveys, the model integrates **Visual Cues** (facial expressions, posture) and **Physiological Signals** (HRV, EDA). The workflow is strictly structured and consists of four stages: **Data Acquisition, Preprocessing, Feature Fusion,** and **Engagement Inference**. This provides an adaptive, real-time framework for improving workforce efficiency and well-being.*

***Key words**: employee engagement, multi-modal assessment, affective computing, physiological signals, visual cues, feature fusion, real-time monitoring, service industry*

Introduction

The service industry is fundamentally human-centered, relying on emotional intelligence, attention, and interpersonal skills to deliver quality outcomes. Employees' engagement their emotional, cognitive, and behavioral involvement in tasks, is a decisive factor influencing productivity, customer satisfaction, and organizational success. High engagement has been linked to enhanced creativity, resilience under stress, and superior interpersonal interactions, whereas low engagement often results in fatigue, absenteeism, and suboptimal service outcomes.

Despite its importance, engagement is challenging to assess in dynamic work environments. Traditional methods such as surveys and interviews are limited by subjectivity, temporal constraints, and the inability to capture subtle fluctuations during work. Employees may overestimate or underestimate their engagement, and managers' observations are often constrained by selective attention. These limitations underscore the need for objective, real-time assessment tools.

Emerging technologies in affective computing and multimodal human–state detection provide a solution. These systems can combine visual data such as facial expressions, gaze patterns, and posture with physiological signals including heart rate variability (HRV), electrodermal activity (EDA), and blood volume pulse (BVP) to infer engagement levels. Previous research in educational and laboratory settings has demonstrated that integrating multiple modalities improves the reliability and accuracy of engagement assessment compared to unimodal approaches.

However, most existing studies focus on controlled environments, such as online learning platforms or experimental labs. The application of multimodal engagement assessment in real-world service industries remains limited. Service work often involves multitasking, emotional labor, and variable interpersonal interactions, which may influence engagement in ways not captured by existing models. Therefore, this study proposes a conceptual workflow model that translates the principles of multimodal engagement assessment into practical frameworks suitable for diverse service contexts.

Literature Review

Engagement and Its Measurement

Engagement is typically defined as a multidimensional construct encompassing emotional, cognitive, and behavioral involvement. In service contexts, emotional engagement reflects empathy, motivation, and enthusiasm; cognitive engagement reflects focus, decision-making, and problem-solving; behavioral engagement reflects consistent performance and task completion. Accurate assessment of these dimensions is essential for improving workforce management, customer satisfaction, and organizational outcomes.

Traditional engagement assessments rely on self-report instruments, supervisor evaluations, and observation checklists. While valuable, these methods are limited in terms of temporal resolution,

susceptibility to bias, and inability to capture micro-fluctuations of engagement during continuous work activities.

Technological Approaches to Engagement Detection

Technological approaches aim to complement traditional methods through objective data analysis. Abedi and Khan (2022) proposed a hybrid deep learning model combining ResNet and Temporal Convolutional Networks (TCN) to detect engagement from visual data in online learning environments [1]. Using the DAiSEE dataset, which contains annotated student videos with four engagement levels, their method achieved state-of-the-art performance compared to CNN, LSTM, and GRU baselines. Spatial features were captured through ResNet, while TCN accounted for temporal dependencies. This study demonstrates the efficacy of combining spatial and temporal representations for visual engagement detection.

Physiological signals provide another dimension of engagement measurement. Sarkar and Etemad (2023) introduced a self-supervised ECG-based framework to recognize emotional states [2]. The model first learns general ECG representations through signal transformation recognition, and then transfers the features to an emotion classification network. Evaluated across four datasets AMIGOS, DREAMER, WESAD, and SWELL the approach improved cross-dataset generalization and reduced reliance on labeled data. Physiological modalities such as HRV and EDA are particularly valuable for detecting arousal and stress, which often correlate with engagement levels.

Integrating visual and physiological data offers further advantages. Singh et al. (2025) presented VisioPhysioENet, a multimodal system using facial landmarks and rPPG signals to detect engagement in learners [3]. By combining the two modalities through advanced fusion methods, the system outperformed unimodal approaches by 8.6% in accuracy. Similarly, Mehta et al. (2024) introduced the MIAM dataset, which combines RGB, depth, and IMU data to assess operator engagement in industrial tasks [4]. Multimodal fusion in these contexts demonstrated improved recognition of actions and behaviors, highlighting the applicability of multimodal approaches beyond educational settings.

Finally, platforms such as AMIRA (Auriol, 2007) exemplify multi-modal integration in real-world field scenarios, supporting decision-making and information access for mobile workers through audio, image, and text data [5]. These studies collectively underscore those multimodal approaches provide richer and more reliable indicators of engagement than any single modality alone.

Table 1.

Comparison of Key Multimodal Engagement Studies

Study	Modality	Dataset	Key Features	Outcome
Abedi & Khan, 2022	Visual	DAiSEE	ResNet+TCN	State-of-the-art visual engagement detection
Sarkar & Etemad, 2023	Physiological	AMIGOS, DREAMER, WESAD, SWELL	Self-supervised ECG	Improved emotion recognition and cross-dataset generalization
Singh et al., 2025	Visual + Physiological	DAiSEE	Facial landmarks + rPPG	Outperformed unimodal methods by 8.6%
Mehta et al., 2024	RGB + Depth + IMU	MIAM	Multimodal network	Accurate industrial task engagement recognition
Auriol, 2007	Audio + Image + Text	In-house	Multi-modal assistance platform	Improved field decision-making

The literature review highlights a clear gap: few studies have applied multimodal engagement detection in service-industry workflows, where dynamic and interpersonal factors play a critical role. This gap motivates the development of a conceptual workflow model tailored to service environments.

Methodology. This study develops a conceptual workflow model for multi-modal engagement assessment, integrating insights from visual and physiological modalities within a structured, service-industry context.

Conceptual Framework

The model consists of four primary stages: data acquisition, preprocessing, feature extraction and fusion, and engagement inference. Data acquisition includes simultaneous collection of visual cues (facial expressions, gaze, posture) and physiological signals (HRV, EDA, BVP) during work activities. Preprocessing aligns, normalizes, and filters the raw data streams to ensure temporal and signal quality consistency. Feature extraction transforms raw data into informative indicators, such as facial movement patterns, pulse variability, and electrodermal peaks. Feature-level fusion then integrates visual and physiological information into a combined representation. Finally, engagement inference interprets the fused features to estimate engagement levels.

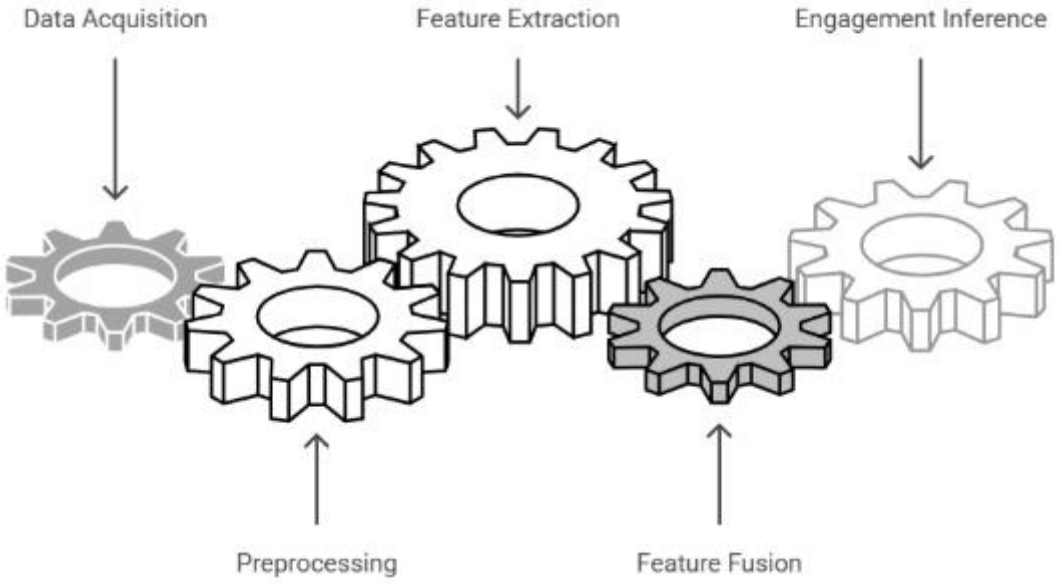

Figure 1. Conceptual Workflow Model of Multi-Modal Engagement Assessment.

This workflow provides a **modular, adaptable framework** suitable for multiple service-industry environments, emphasizing objectivity, real-time capability, and comprehensive measurement of engagement through complementary multimodal data sources.

Data Modalities and Integration

Visual signals provide external indicators of engagement, capturing attention, emotional expression, and behavioral consistency. Physiological signals capture internal arousal and cognitive load, offering insights that are not externally observable. Together, these modalities provide a comprehensive view of engagement. In practice, data could be collected via cameras and wearable sensors embedded in workplace environments.

Integration of these modalities is conceptualized as **feature-level fusion**, which merges features extracted from visual and physiological data into a single, unified representation. This fusion ensures that the model accounts for both observable behaviors and internal emotional states, increasing reliability and robustness.

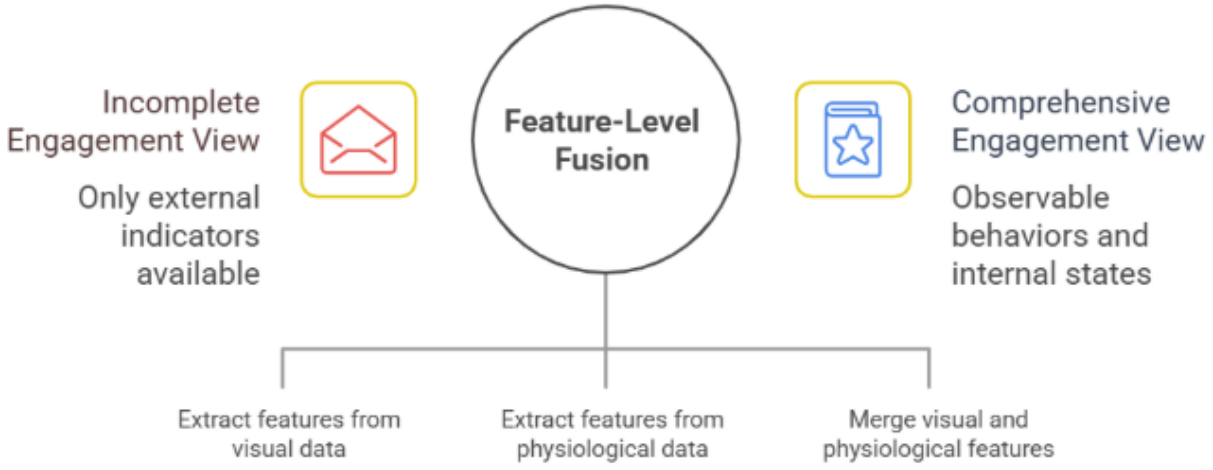

Figure 2. Integration of Visual and Physiological Features.

This diagram illustrates how features extracted from visual cues (facial expressions, gaze, posture) and physiological signals (HRV, EDA, BVP) are combined into a single fused representation [6]. The fusion stage integrates complementary information from both modalities, capturing both external behaviors and internal states, which enhances the accuracy and robustness of engagement assessment.

Workflow Application

The workflow model is designed to be adaptable across multiple service contexts. In education, the framework could monitor student engagement in virtual classrooms. In healthcare, it could assess nurse attentiveness during critical procedures. In customer service, it could help managers evaluate employee focus in real time during client interactions [7].

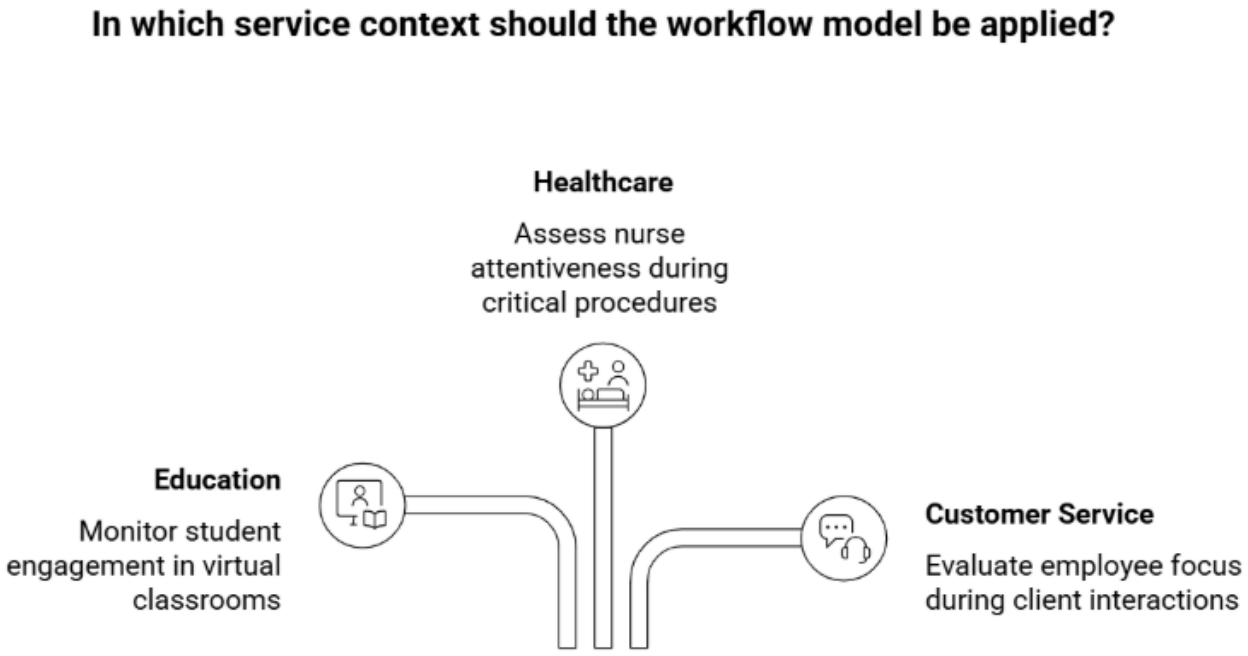

Figure 3. Application of the Workflow Model in Different Service Contexts.

This figure illustrates how the conceptual workflow model can be applied across different service-industry environments. Visual and physiological data are collected from employees in classrooms, hospitals, and customer service settings. The diagram shows that the same workflow data

acquisition, preprocessing, feature extraction, fusion, and engagement inference can be adapted to various contexts to monitor and evaluate employee engagement in real time.

Discussion

Although the model is conceptual, it provides several theoretical advantages. Multimodal integration allows for holistic engagement assessment, reducing reliance on single modalities and mitigating errors caused by environmental or individual variability. The sequential workflow ensures clarity, with modular stages that can be independently developed and empirically tested in the future.

The framework also emphasizes adaptability. Different contexts may prioritize distinct modalities; for example, visual cues may dominate in educational settings, while physiological signals may be more relevant in high-stress healthcare scenarios. Moreover, once implemented, the framework could support **real-time monitoring**, providing feedback for interventions to maintain or enhance engagement.

Ethical considerations are critical. Collection of physiological and visual data must adhere to privacy, consent, and security standards, ensuring that monitoring does not infringe on employee rights. Future empirical studies should validate the model, comparing multimodal assessment with traditional engagement measures and evaluating performance across service sectors [8].

Conclusion

This paper presents a conceptual workflow model for assessing employee engagement in the service industry using multimodal data that combine visual and physiological signals. Traditional assessment methods such as surveys, supervisor observations, and periodic evaluations cannot capture real-time fluctuations in engagement. In contrast, integrating external behavioral cues (facial expressions, gaze, posture) with internal physiological indicators (heart rate variability, electrodermal activity, blood volume pulse) provides a more objective and comprehensive understanding of engagement.

The proposed workflow includes data acquisition, preprocessing, feature extraction, multimodal fusion, and engagement inference. Its modular design allows the model to be adapted for various sectors, including education, healthcare, hospitality, and customer service.

Although conceptual, the framework offers a foundation for future empirical research and practical implementation. Potential next steps include pilot studies in real service environments, comparison with existing methods, and the development of adaptive feedback mechanisms that use engagement data to support employee focus and well-being. Ethical issues such as data privacy, informed consent, and responsible handling of physiological information remain essential considerations.

Summary: *The article examines the development and analysis of a mathematical model that takes into account the processes of inductive grounding of a neutral in medium-voltage (6-35 kV) electrical networks, the active resistance of the grounding reactor, the effects of nonlinear saturation of the magnetic circuit, and the influence of external disturbances. Also, statistical data and obtained results are presented in the form of tables and graphs..*

Key words: *inductive grounding, neutral, electrical networks, medium voltage, mathematical modeling, Runge–Kutta method, transient processes, nonlinear saturation*

Introduction

Inductive neutral grounding is widely used in medium-voltage (6-35 kV) electrical networks to increase their reliability and reduce ground fault currents. This method is based on the use of a grounding reactor, which compensates for the capacitive currents of the network and reduces the probability of arc closures occurring.

With the increasing load and the spread of distributed generation in medium-voltage networks, the issues of protection and stability of electric power systems are becoming particularly relevant. Under such conditions, the correct choice of inductive neutral grounding parameters allows for a reduction in accidents and minimizes equipment damage. In addition, the optimal configuration of the grounding system contributes to a reduction in technological losses of electricity and improves the quality of electricity supply.

Analysis of transient processes in inductive grounding of the neutral requires a comprehensive approach, including mathematical modeling, numerical calculation methods, and experimental confirmation of the obtained results. This work examines key aspects of modeling these processes, which allows for the development of recommendations for selecting optimal parameters of inductive neutral grounding to enhance the reliability of electrical networks.

Relevance

Traditional neutral grounding circuits have several disadvantages, such as high overvoltages during arc closures and the complexity of setting up compensating devices. Inductive grounding of the neutral allows for a reduction in the amplitude of ground fault currents, which increases electrical safety and reduces equipment damage. However, selecting inductance parameters and analyzing transient processes requires the application of mathematical models and numerical calculation methods.

Purpose of research

Development and analysis of a mathematical model of the processes of inductive neutral grounding in 6-35 kV electrical networks, taking into account the active resistance of the reactor, nonlinear saturation effects of the magnetic core, and the influence of external disturbances.

Theoretical foundations of inductive neutral grounding

In distribution networks with a working voltage of 6-35 kV, the main problem is the grounding mode for the reliability of the consumer's power supply, the safety of electrical machines and power cables, the safety of people and animals found in the passages of the lines, as well as the choice of principles and types of relay protection and automation devices (RPA), methods for using these devices for disconnection, signaling in single-phase ground closures (LPS) **[1, p.3]**.

In the modern industrial world, any power outage leads to the most tragic and unpredictable consequences **[2, p.15]**. In August and September 2003, power grid accidents shocked almost all industrial countries. In the vast majority of cases, the causes of such unpleasantness are overstresses, including those arising in the case of single-phase ground closures **[3, p.7].**

Inductive neutral grounding represents a method of compensating for capacitive currents arising during phase grounding in medium voltage electrical networks. The main element of this circuit is the arc-extinguishing reactor (Petersen coil), which is connected between the transformer neutral and the ground.

The operating principle of inductive grounding is based on the fact that in the process of single-phase grounding, the current passing through the grounding reactor partially compensates for the capacitive current of the network. This allows for a reduction in the risk of arc overloads and a decrease in equipment damage.

The main advantages of inductive neutral grounding are:

- reduction of ground fault current amplitude,
- reduction of the probability of arc closures,
- increasing the electrical safety of the network,
- reduction of thermal and mechanical damage to equipment.

However, this method also has its limitations. In particular, the selection of grounding reactor parameters should take into account:

- resonance phenomena that can lead to overvoltages,
- the effect of the reactor's active resistance on the compensation efficiency,
- nonlinear properties of the reactor magnetic core.

Mathematical model of processes in a network with inductive grounding

The processes in a network with inductive grounding are described by a system of differential equations that take into account the influence of the active resistance of the grounding reactor, the inductance, and the network capacity:

$$\frac{dU}{dt} = -\frac{I_1}{C} \qquad (1)$$

$$\frac{dI_1}{dt} = \frac{U}{L} - \frac{R_1 I_1}{L}$$

where:

U- capacitance voltage,

U_L-current through inductance,

C - network capacity relative to the ground,

L- grounding reactor inductance,

R_L-is the active resistance of the grounding reactor.

C- network capacity,

L_-nom-nominal inductance of the reactor,

R_L- reactor active resistance,

U_0- initial voltage,

I_o- initial current.

Additionally, using the example, the nonlinearity of the ground reactormagnetic core through the saturated inductance, given by the approximating function, is considered in the calculations.

Initial data

The following parameters are used for numerical modeling:

- C=1 mkf, -network capacity relative to the ground,(2)
- $L_{nom} = 0.1$ Ohms of the reactor′s nominal inductance,
- U_0=1 B– initial voltage,
- I_0=0 AInitial current

Based on the given model (1) and initial data (2), we solve the problem using the Runge-Kutta method. This method allows for the numerical integration of the system of differential equations, ensuring high accuracy with a relatively small number of steps.

Solution algorithm (Runge-Kutta method)

1. Determining the initial network parameters.

2. Formation of a system of differential equations.
3. Application of the 4th order Runge-Kutta method for numerical solution.
4. Constructing time graphs of transient processes.
5. Analysis of the influence of parameters on the dynamics of the system.

Solution code (MATLAB)

Digital results and their interpretation

The initial conditions are given in Table 1 for the values of voltage and current a, as well as visual results of voltage on the capacitor and current through the inductor at different times of time (Fig. 1).

Table 1. The values of voltage and current at different times.

Time (s)	Viltage (V)	Current (A)
0.00000	1.000000	0.00000
0.00500	-0.664134	-0.001912
0.01000	0.161285	0.002463
0.01500	0.246919	-0.002054
0.02000	-0.469504	0.001205

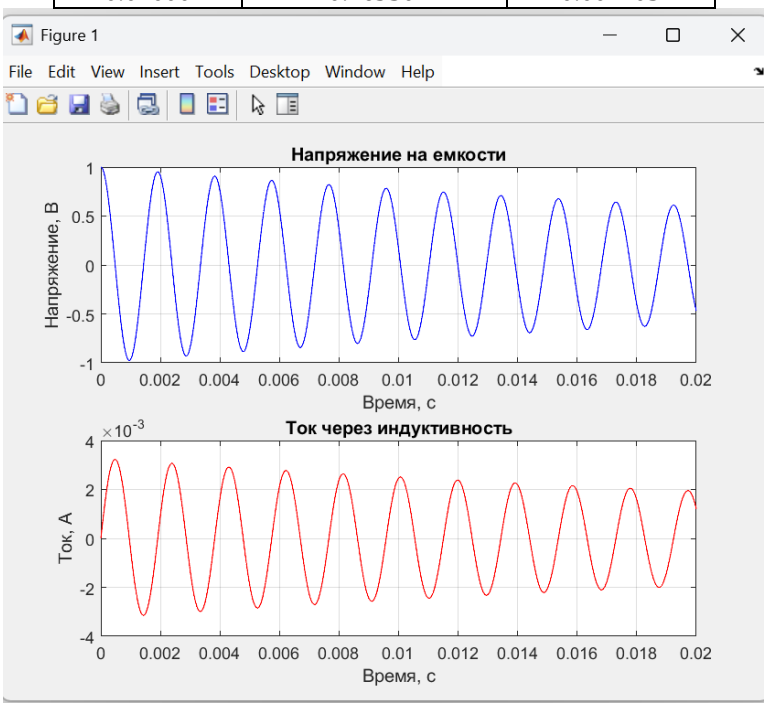

Fig.1. Change in capacitance voltage and current through inductance at different times

Analysis and discussion

The problem is solved in the MATLAB environment using the 4th-order Runge-Kutta method, which ensures sufficiently high accuracy in the numerical integration of systems.

Initial conditions (judging by Table. 1) are given as:

$$U_{(0)}=1.0\ V,\ I_1 = 0.0\ A.$$

1. The behavior of voltage U (t)

Initial moment t=0

U $_{(0)}$ = 1.0 V. The capacitor is initially charged to 1 V, and the current through the inductor is zero.

Vibrational nature:

From the first points (0.005 s, 0.010 s, etc.), it is evident that the voltage changes its sign from positive to negative and vice versa, indicating an oscillatory process.

- At*t*=0.005s :*U*≈−0.664B (the voltage has changed polarity.).
- At*t*=0.010 s: *U*≈0.161B (back to the positive region).
- At*t*=0.015s: *U*≈0.247 B (Another phase of oscillation).
- At*t*=0.020 s: *U*≈−0.470 B (again negative half-wave).

Amplitude and attenuation:

Comparing the voltage modulus at different times, it can be observed that the voltage amplitude gradually decreases. For example, at the moment of 0.005 s, the modulus U is about 0.66 V, and by 0.020 s - already about 0.47 V (by modulus). This indicates the presence of damped oscillations caused by the resistance R_1.

1. Current behavior *$I_1(t)$*

Initial moment *t=0*

$I_1(0) = 0$. Since the capacitor is charged and there is no current in the inductor, the initial energy of the system is completely concentrated in the electric field of the capacitor.

Change current sign:

- At*t*=0.005s: *I_1*≈−0.001912 A (The current has become negative.).
- At$_t$=0.010 s: *I_1*≈0.002463 A (The current has become negative.).
- At$_t$=0.015 s: *I_1*≈−0.002054 A (again negative).
- At*t*=0.020 s: *I_1*≈0.001205 A (positive).

Thus, the current, like the voltage, oscillates, passing through zero and changing its sign, which corresponds to the typical behavior in the oscillatory circuit.

Amplitude change:

The maximum current values (by modulus) at the indicated points also gradually decrease (for example, from ~0.00246 A to ~0.00205 A and further to ~0.00120 A), indicating a decrease in attenuation.

Phase relationships

Figure 1 (top graph - *U(t)*, bottom - *$I_1(t)$*) shows that the voltage and current oscillations are phase-shifted relative to each other, as should be the case in a classical LC oscillatory system, taking into account the resistor.

• When the voltage across the capacitor reaches its maximum, the current is close to zero.

• When the current reaches its maximum, the voltage across the capacitor passes through zero.

This behavior reflects the process of energy exchange between the electric field in the capacitor and the magnetic field in the inductor, with a portion of the energy dissipating as heat in the resistor **R_1.**

1. Physical meaning of the obtained results

1. ***Initial energy.*** At the moment t=0, the capacitor is charged, therefore, the system's energy is concentrated in the capacitor's electric field. The current is zero, therefore, there is no energy in the magnetic field of the inductor.

2. ***Vibrations.*** When the circuit is closed (or the calculation is started), the charge begins to flow into the inductance, forming a magnetic field. When the voltage on the capacitor drops to zero, the current in the inductor reaches its maximum. Then the process goes in the opposite direction: the capacitor is charged again, but with the opposite sign, and the current decreases. This is how fluctuations occur.

3. ***Attenuation.*** The real circuit has resistor **R1**, so part of the energy dissipates in heat. That is why the amplitudes of voltage and current gradually decrease (sink) over time.

4. ***Dependence on parameters.*** The main characteristics of the oscillatory process (frequency and degree of attenuation) depend on **L, C,** and $\mathbf{R_1}$:

Specific (Resonance) Frequency $\omega_0 \approx \frac{1}{\sqrt{LC}}$.

The attenuation coefficient is related to $\frac{R}{2L}$. When $\mathbf{R_1}$ is greater, the oscillations are damped faster.

4. Analysis of graphs (Fig. 1)

The graphs presented in Figure 1 clearly show:

Vibrational character (both quantities (voltage and current). The shape is close to sinusoidal, which is typical for LC-circuits.

Change of sign: voltage and current pass through zero values, reflecting the continuous flow of energy between electric and magnetic fields.

Decrease in amplitude as time increases, indicating the presence of damping.

Phase shift between voltage and current, which in an ideal LC circuit (without losses) would be $\pi/2$ (90°). In the presence of resistance, this phase changes somewhat, but the overall picture remains close to classical.

5. Conclusions

1. **Correctness of the numerical solution.** The obtained voltage and current values correspond to the theoretically expected behavior of the oscillatory circuit: the initial charge of the capacitor, the transition of energy to the magnetic field of the inductor, the change in the polarity of the voltage and the direction of the current, and the attenuation due to resistance.

2. **Qualitative coincidence with the theory.** The observed wave-like shape of the graphs, the alternation of voltage and current signs, and the gradual decrease in amplitudes confirm that the model (ODU system) and Runge-Kutta method provide an adequate description of real processes in the RLC circuit.

3. **Numerical data.** Table-based results (Table 1) give specific values of U and I_1 at discrete moments in time, and the graphs allow for visual tracking of the dynamics. The totality of these data is important for further analysis, including:

- determination of the frequency and period of oscillations;
- estimates of the attenuation rate (calculation of the logarithmic decrement of oscillations);
- comparison with theoretical calculations to verify the correctness of the vb.

Practical significance.

Similar analysis is important when designing oscillatory circuits, filters, resonant circuits, and other devices where attenuation, resonant frequencies, and transient processes must be considered.

Conclusion

The main conclusions of the study can be formulated as follows:

The mathematical model describing the relationship between capacitor voltage and current through inductance adequately reflects the physical processes in a circuit with inductive grounding. The numerical results presented in the form of tables and graphs show a typical oscillatory nature of

transient processes with a clearly expressed phase shift between voltage and current, which corresponds to theoretical expectations.

The application of the 4th order Runge-Kutta method allowed for obtaining high-precision results even with the use of sufficiently small integration steps. This method has proven its validity in solving systems of ordinary differential equations, making it a reliable tool for analyzing the dynamics of systems with inductive grounding.

The analysis of the obtained results emphasizes the importance of correctly selecting the parameters of the system elements (capacity, inductance, and active resistance of the reactor). Changing these parameters significantly affects the amplitude, frequency of oscillations, and attenuation rate, which is crucial for ensuring the reliability and safety of electrical networks.

The modeling results and subsequent analysis demonstrate the practical applicability of the obtained data for optimizing the parameters of inductive neutral grounding. This allows for a reduction in the probability of arc closures occurring, reduces equipment damage, and increases the overall electrical safety of medium voltage systems. Similar modeling can also serve as a basis for developing recommendations for designing and configuring relay protection and automation systems.

Despite the positive results obtained, further research on the nonlinear effects of magnetic core saturation and the influence of external disturbances on the system's dynamics remains relevant. Further experimental studies and their comparison with numerical models will help to more accurately determine the optimal parameters of inductive grounding and expand the scope of application of the developed methodology.

As a result, the conducted research not only confirms the correctness of the chosen mathematical model and numerical method, but also opens up opportunities for the practical implementation and further optimization of inductive grounding systems in electrical networks, which is of significant importance for increasing their reliability and safety.

EVALUATION OF ENHANCING OPERATIONAL RELIABILITY OF THE MAIN CANAL THROUGH THE INSTALLATION OF A SETTLING BASIN WITH HYDRAULIC FLUSHING

Saparov A.B.
Institute of Agriculture and Agrotechnology of Karakalpakstan

Summary: *The article examines the results of field research on determining the location of the flushing settling tank and developing measures to adapt the operating conditions of the Anasay canal to the Kerder and Kattagar channels, as well as the technology for flushing the settling tank by maneuvering the gates of the Tasharna canal to obtain the necessary flow velocity for flushing sediment.*

Key words: *sedimentation tank, sediments, channel, fractions, diameter, turbidity, washing velocity, flow rate, water discharge, gate maneuvering, hydraulic size.*

Introduction. The control of solid sediment in irrigation systems is achieved through the use of irrigation settling basins, designed to create conditions for solid particles to settle on the bottom, with subsequent removal of these deposits by hydraulic or mechanical means. Minor deviations in the concentration of suspended particles at the outlet of the settling basin from the designed values can lead to instability in the channels of main and distribution canals, consequently disrupting the functionality of the entire irrigation network.

In turn, the standard turbidity values at the settling tank outlet should be coordinated with the sediment-carrying capacity of the flow in the canal section exiting the settling tank. The conceptual scheme for hydraulic calculation of turbidity in the settling tank involves solving the problem of sediment deposition along the length of the settling tank.

Analysis of methods and materials. Existing methods for calculating irrigation settling tanks, proposed at various times by A.N.Gostunsky, S.Kh.Abalyants, A.G.Khachatryan, and other researchers, do not fully reflect the true picture of the ongoing processes. First and foremost, these methods do not account for the alternation between sediment deposition processes and their resuspension into the flow, caused by changes in the fractional composition of sediments. In turn, knowledge of the sediment settling path length, differentiated by various fractions, would allow for obtaining data on the redistribution of siltation volumes along the length of the irrigation settling tank. This information is necessary for selecting a rational design solution for the settling tank's operation and an efficient system of operational measures [1-3].

Recommendations for the hydraulic calculation of turbidity in settling tanks, taking into account the fractional composition of sediments, were developed by A.G.Khachatryan, H.Sh.Shapiro, and V.S.Verbitskiy. However, the proposed calculation methods were limited to the framework of a one-dimensional hydraulic model, did not take into account the intra-annual distribution of turbidity in the rivers and the dynamics of the state of the riverbed and canals. Meanwhile, changes in the embankment structure and its dimensions significantly affect the stability of irrigation network elements, especially the lower reaches of hydraulic structures - the formation of the embankment ensures conditions for increasing the upper limit of non-eroding velocities.

Research results. Based on the results of field research, work was initially carried out to determine the location of the settling tank.

Figure 1. Locations of the settling tank at the end of the Anasay Canal

When installing a sedimentation tank with hydraulic washing, the required difference between the beginning of the washing gallery and the river water level to obtain a water velocity that allows for the washing of sediment accumulated in the sedimentation tank chamber should be written as follows:

$$D_h = \Sigma\xi \frac{V_{flu}^2}{2g}, \quad (1.1)$$

where: $\Sigma\xi$ – sum of the coefficients of hydraulic losses in the gallery;

V_{flu} – water flow velocity in the flushing gallery;

g – gravitational velocity.

To obtain the required flow velocity for sediment flushing, the water level difference should be at least 1,83 m, and this velocity should be written as follows:

$$V_{flu} \geq \omega \frac{h_{flu}}{d} P^{1,85} = 2{,}6 \; m/sek, \quad (1.2)$$

where: d – the diameter of sediment particles requiring washing, smaller diameter particles make up 75% of the sediment composition;

ω - the hydraulic size of these particles,

h_{flu} - flushing depth,

P - the percentage of sediment mass in the flushing flow.

Considering that in any hydrological conditions of flooding, low water, there is no necessary water level drop, it is necessary to find the possibility of installing hydraulically washed sedimentation tanks. Thus, in the existing hydrological-hydraulic and topographic conditions, the installation of periodically operating settling tanks is a technically acceptable solution [2,5].

It should be noted that when considering options for constructing settling tanks with periodic or continuous flushing, it is necessary to place a regulating structure equipped with gates at the head of the canal, concrete the settling chambers to ensure appropriate hydraulic regime, and place a control structure equipped with flushing galleries at the end of the settling tank. At the same time, the installation of appropriate structures can lead to a decrease in the water level throughout the canal, which negatively affects the operation of water intake structures at the end of the main canal.

The main tasks in determining the dimensions of the settling tank are to determine its geometric dimensions and sedimentation time, since it is these parameters that have the greatest impact on its operational characteristics, and ultimately on the capital costs for its construction and operational costs for its maintenance.

As initial data for calculating the settling tank, the most unfavorable conditions to ensure the operation of hydraulic structures were taken, in particular, this relates to water discharge and the

average suspended turbidity of the flow. As for sediments that must be retained in the settling tank, all sediments entering with the river flow must be retained, except for a fraction of 0,0015 mm and smaller. Thus, the following parameters were taken into account in the calculations:

Discharge coming to the settling tank $Q=60\ m^3/sek.$

Settling tank depth $H=7,42\ m.$

Average water flow velocity in the settling tank $V_{av} = 0,35\ m/sek.$

Average weighted turbidity the entrance to the settling tank $\rho_0 = 3,6\ kg/m^3$.

Diameter of the smallest fraction that must be retained in the settling tank $D = 0,05\ mm.$

Hydraulic size of the smallest fraction that must be retained in the settling tank $\omega = 0,00178\ m/sek.$

Average weighted hydraulic sizes of sediments $w_0=0,00706\ m/sek.$

Based on the obtained information on the granulometric composition of sediments entering the canal with river water and the hydraulic characteristics of the canal, it is possible to determine the length of the settling tank by assigning the water velocity in it.

Taking into account the recommendations, let's assume the settling tank width is equal to the design channel width and $V_{av} = 0,35\ m/sek.$ For a rectangular cross-section of the settling tank and at a water flow velocity of *0,35 m/sec*, *L* - is the length of the settling tank that ensures the retention of sediments of the smallest fraction (diameter 0,05 mm), for which information about its content is available, and is:

$$L = H\ V/\omega = 7,42\ x\ 0,35/0,00178 = 1458,9\ m \qquad (1.3)$$

Here: *L* - sedimentation tank length,

V - average water flow velocity in the settling tank.

One of the most important characteristics from an operational point of view is the settling time. Taking into account the average weighted turbidity of the water entering the settling tank, as well as the need for continuous water supply to the irrigation canal, it is possible to determine the probable duration of sedimentation in the settling tank.

Calculation of sedimentation time. Calculating ω/V and H/L according to the recommendations, we find the probability of precipitation of the calculated fraction P = 98%, i.e., at least 98% of sediments with a diameter of 0,05 mm and larger will be retained in the settling tank [1,2,4,5].

For the required flow velocity and sediment flushing, we chose the Tasharna Canal, which has not been operated for a long time. The calculated capacity of the regulator and the Tasharna Canal from the Bessaga Hydraulic Unit is 150,0 m^3/s. Commissioned in 1986, the purpose of the Tasharna Canal construction was to replenish the Kegeyli Canal during low-water years on PK 114 from the Bessaga Hydraulic Unit. The channel regulator has five holes measuring 8,0x2,5 m, separated by a 75 sm thick wall. The holes are covered with flat, submerged, sliding gates with lifts having an electric drive. A 30 cm thick reinforced concrete ponur is made from the upper reach side [3,5].

In recent years, starting from the 2000s, the canal has been closed to the pressure of the Anasay supply channel, which has led to a severe silting of the upper pool of the Bessaga hydraulic unit at the end of the Anasay canal.

The recommended sedimentation volume will be 253298 m^3 per year, and the sedimentation tank, under these operating conditions, can become completely silted after 19 months.

Conclusion: Taking into account the unevenness of the velocity distribution diagram in the horizontal plane, as well as the trapezoidal cross-section of the settling tank, the settling time can be reduced by 15-20% and amount to about 15 months. Nevertheless, the installation of two parallel settling chambers allows for the stable supply of clarified water for a sufficiently long time and, at the same time, the cleaning of the sludge-filled chamber.

Based on the results of field research, work was initially carried out to determine the location of the settling tank.

Measures have been developed to adapt the operating conditions of the Anasay Canal to the Kerder and Kattagar canals. A technology for flushing the settling tank by maneuvering the gates of

the Tasharna canal has been developed. To obtain the required flow velocity for sediment flushing, the water level difference must be at least 1,83 m.

Summary. *This article addresses the issues of improving electric power quality and reducing voltage losses in 0.4 kV electrical networks based on reactive power compensation. The article presents a methodology for selecting and calculating reactive power compensation devices, aimed at ensuring voltage stability in electrical networks, as well as reducing the voltage unbalance coefficient for negative and zero sequences. The results of reducing active power losses and improving the efficiency of electricity utilization through optimal reactive power compensation have also been analyzed. The research results have practical significance for ensuring energy efficiency in 0.4 kV networks and improving the reliability of the power supply system.*

Key words*: reactive power compensation; reactive power factor; active power factor; power losses; electric energy quality indicators; voltage losses; voltage unbalance factor; energy saving; energy efficiency; 0.4 kV electrical networks.*

Introduction. In most rural areas of the Republic of Uzbekistan, electricity supply is provided through overhead power transmission lines, which are characterized by significant voltage drops. This is primarily due to the long distances between power supply sources and consumers residing in dispersed territories. At present, due to the growth of the population, the consumption of electrical energy in the residential sector is also rapidly increasing. As a result, power transmission lines designed in the second half of the last century based on the electricity consumption standards of that time no longer meet the required transmission capacity. As a result, the power quality indicators for consumers with a voltage level of 0.4 kV also do not meet the requirements of the state standard O'zDSt 1044:2003, and at present, this issue remains relevant [1-4].

When electrical energy is transmitted through power networks whose quality does not meet the requirements of the parameters established by the state standard, its losses increase. The issue of implementing effective measures to improve the quality of electric power in 0.4 kV distribution networks is also a relevant and important topic. Since consumers with relatively low power demand are connected to short feeders, reactive power compensation and harmonic filtering in 0.4 kV networks are considered economically impractical. However, in developed countries, devices for reactive power compensation and harmonic filtering are widely used in 0.4 kV distribution networks. Moreover, the implementation of these measures in our Republic can also ensure economic efficiency [1-4].

Materials and Methods. It is known that for 0.4 kV electrical networks, some of the main indicators of electric power quality are: δU_y - steady-state voltage deviation, K_{2U} - negative-sequence voltage unbalance factor, and K_{0U} - zero-sequence voltage unbalance factor. For example, according to the state standard O'zDSt 1044:2003, the voltage deviation at the point of electric power delivery during 100% of the weekly period shall not exceed 10% of the nominal (permissible) voltage value. In the process of transmitting electrical energy at voltages above 0.4 kV through overhead power lines, voltage reduction is an expected phenomenon and represents a complex quantity [1-2].

$$\underline{\Delta U} = \underline{U_1} - \underline{U_2} \quad (1)$$

Where $\underline{U_1}$ is the voltage at the beginning of the line, V, and $\underline{U_2}$ is the voltage at the end of the line, V.

The arithmetic difference of the expression $\Delta U = U_1 - U_2$ is referred to as the voltage drop. For overhead power transmission lines with a rated voltage above 0.4 kV, the active resistance *R* of the line should be approximately equal to, or greater than, its inductive reactance *X*. Therefore, when calculating such networks, the transverse component (the imaginary part) of the voltage deviation may be neglected [1-4]:

$$\Delta U = \frac{PR + QX}{U_1} \tag{2}$$

From expression (2), it can be seen that the voltage losses can be reduced both by decreasing the line resistance and by compensating for *Q* - the reactive power. Therefore, since reducing the resistance of overhead power transmission lines is an economically costly task, it is necessary to implement reactive power compensation. In most cases, this power is not fully utilized in low-voltage networks (only about 25-30% is consumed), which, in turn, leads to voltage losses and, consequently, to losses of active power. The process of compensating reactive power by connecting capacitor banks in parallel to the network is called transverse compensation. In the course of such a process, reactive power compensation using a capacitor bank increases the power factor and simultaneously reduces voltage losses in the network, thereby stabilizing its level. The reactive power generated by a capacitor bank is determined by the following expression, kVAr [3-5]:

$$Q_C = U^2 2\pi f C \tag{3}$$

The selection of capacitor banks is carried out based on the need to increase the line voltage, taking into account the constancy of the active load value. Thus, the difference in voltage losses in the line before and after the connection of capacitor banks is determined as follows:

$$\Delta U = \Delta U_1 - \Delta U_1 = \frac{\left[P_1 r_L + Q_1 x_L - \left(P_2 r_L + Q_2 x_L\right)\right]}{U_{nom}^2} \tag{4}$$

where P_1 and P_2 are the active powers at the beginning of the line and at the consumer, kW; Q_1 and Q_2 are the reactive powers at the beginning of the line and at the consumer, kVAr; r^L and x_L are the per-unit active and inductive resistances of the network, Ω/km.

As a result of reactive power compensation Q_C, the additional reactive load of the network ($Q_2 = Q_1 - Q_C$) decreases. Since the active powers at the beginning of the line and at the consumer's end are equal to each other ($P_1 = P_2$), the relative change in voltage regulation is determined as follows:

$$U_{per} = \frac{Q_C x_L}{U_{nom}^2} \tag{5}$$

In source [3], a method of transverse compensation of reactive power in 0.4 kV distribution networks is proposed. The authors have developed a methodology for calculating reactive power compensation devices in 0.4 kV electrical networks, aimed at ensuring stable voltage deviation for all consumers within the permissible limits established by the national standard, in networks with an average power factor (cosφ) of 0.8 or lower. According to this methodology, it is proposed to install reactive power compensation devices directly on transmission lines. At the same time, it is emphasized that the power capacity of the specified devices must not exceed 50 kVAr [1-4, 6-11].

It is advisable to begin the installation of reactive power compensation devices at the point closest to the transformer substation where the consumer is connected, in cases where the voltage deviation does not comply with the permissible values established by the state standard. Moreover, in accordance with expression (2), after determining the updated voltage deviation values at all consumer connection points based on calculations (or measurements), the reactive power compensation device is installed at the location closest to the transformer substation where the voltage deviation exceeds the permissible limits established by the national standard. Reactive power compensation devices must be installed in such a manner that the process continues until the voltage

deviation at all consumer connection points complies with the permissible values established by the national standard. When determining the locations for installing reactive power compensation devices, their reactive power values are also established, since these values must not lead to the occurrence of overcompensation in the lines [1-4, 6-14].

For the voltage unbalance factor according to the negative- and zero-sequence components, the following electrical energy quality standards are established:

- The voltage unbalance factor by negative sequence at the power delivery point - K_{2U}, and the voltage unbalance factor by zero sequence - K_{0U}, shall not exceed 2% on average over a 10-minute interval during 95% of the weekly period;

- The voltage unbalance factor of the negative sequence at the power transmission point - K_{2U}, and the voltage unbalance factor of the zero sequence - K_{0U}, shall not exceed 4% on average over a 10-minute interval throughout 100% of the weekly period.

In the case of an unbalanced phase load, power losses increase not only in the phase conductors but also in the neutral conductor due to the flow of current [3-4].

$$I_A^2 + I_B^2 + I_C^2 \geq 3I_{cp.}^2 \tag{6}$$

Here, I_{cp} is the average three-phase current flowing through each phase under a balanced load, A.

In a three-phase, three-conductor line, power losses can increase by up to N^2 times due to the unevenness of the phase load. For a three-phase line with four conductors, this situation is calculated using the following expression [3-4, 6-11, 15]:

$$N^2\left(1+1{,}5\frac{R_H}{R_\Phi}\right)-1{,}5\frac{R_H}{R_\Phi} \tag{7}$$

Where R_H and R_Φ are the resistances of the neutral and phase conductors, respectively, in ohms; N^2 is the square of the line's phase load unbalance factor, which is determined by the following expression:

$$N^2 = \frac{1}{3}\left[\left(\frac{I_A}{I_{cp}}\right)^2 - +\left(\frac{I_B}{I_{cp}}\right)^2 + \left(\frac{I_C}{I_{cp}}\right)^2\right] \tag{8}$$

During the inspection and operation of networks, it is necessary to reduce the degree of unevenness of phase loads. If an overload occurs in one of the line phases or in another, the average values of the phase currents in that phase will differ over an extended period of time. In this case, a reduction in asymmetry is achieved due to the probable symmetrical distribution of phase loads [3-5, 7-11, 15-19].

Results

Figure 1 presents the results of the calculations of active and reactive power before compensation, as well as the reactive power after compensation, performed based on the methodology for calculating reactive power compensation devices presented in the article.

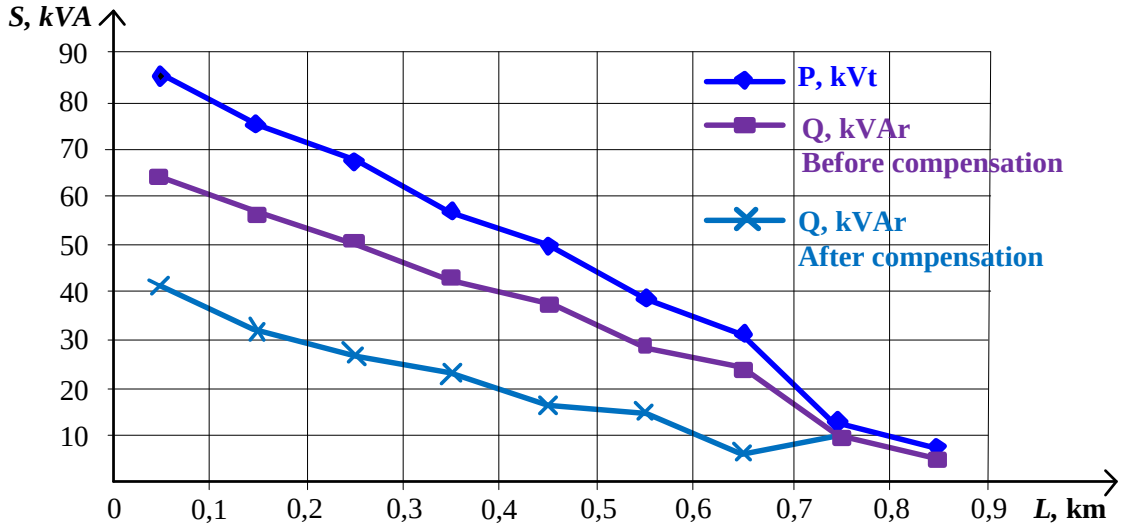

Fig.1. Graph of the variation of active and reactive power depending on the line length

Moreover, the presented calculations were performed based on the methodology of summing the calculated loads of the transformer substation. This illustrates the dependence of the reactive power compensation device capacity on the line length: for a line length of L=0.5 km, the device capacity is Q_C=20.9 kVAr, whereas for a line length of L=0.7 km, it is Q_C=17 kVAr, reflecting the relationship between the device capacity and the line length at their points of installation [3-4, 12-19].

Figure 2 presents the results of energy loss calculations in the 0.4 kV network before and after compensation.

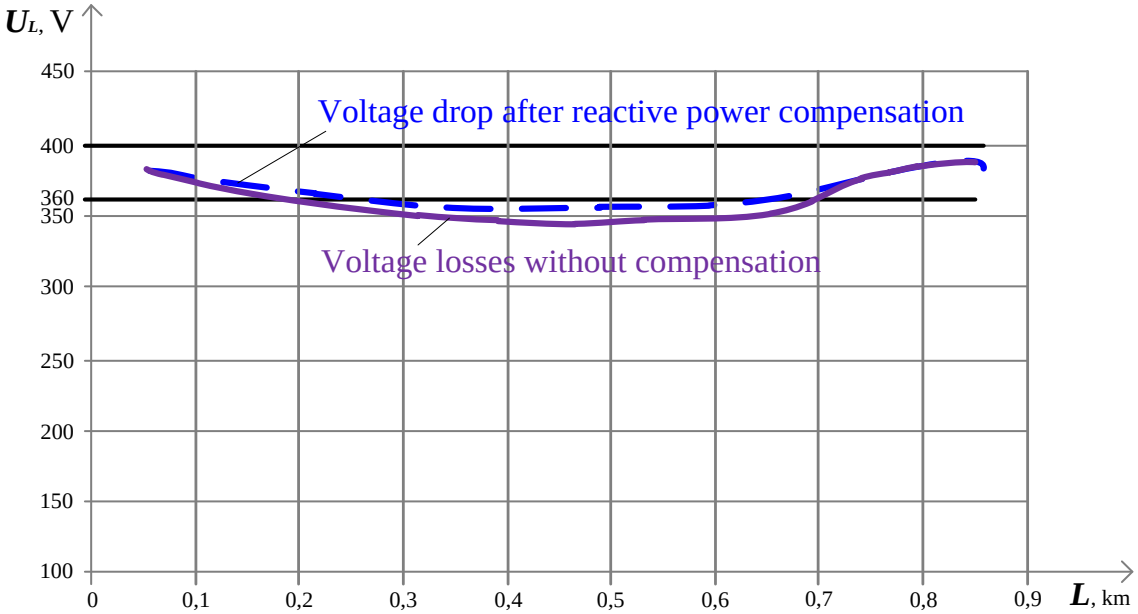

Fig.2. Graph of the calculated voltage loss values at the network connection points with a step of 0.1 km

Figure 2 presents an analysis in which the voltage at the output of the transformer substation is considered to be 400 V, while the permissible minimum value is 360 V (below 400 V. The solid line represents the voltage losses before compensation, while the dashed line represents the voltage losses after compensation, depending on the length of the network line. From the presented graphs, it can be seen that by using the proposed calculation method, due to the selection and placement of reactive power compensation devices in the network, voltage losses can be reduced to up to 3% of

the nominal value. After the installation of reactive power compensation devices, the steady-state deviations relative to the nominal voltage remain within the permissible limits [3-5, 7-19].

The occurrence of voltage unbalance is associated with the flow of negative- and zero-sequence currents in the power supply system, which is caused by the asymmetry of phase loads, as well as the differences in current vectors and the angles between them. It is known that such currents can be expressed through symmetrical components: $\underline{I}_1$ - positive sequence, $\underline{I}_2$ - negative sequence, and $\underline{I}_0$ - zero sequence. The objective of compensation is to install a reactive power compensation device in parallel with the electrical load (at the corresponding buses of the area), which compensates for the negative-sequence and zero-sequence currents. In this case, the current of the compensating device is equal in magnitude to the load current and has the opposite phase. When a compensation device is installed on the line conductors for reactive power compensation and network phase balancing, no zero-sequence current arises; therefore, in such a connection scheme, the capacitor bank does not provide a balancing effect for the zero sequence. Let us examine the voltage leveling effect associated with phase reactive power compensation. The system of unbalanced currents of the compensating device, expressed in terms of symmetrical components - $\underline{I}_{ak}$, $\underline{I}_{bk}$, $\underline{I}_{ck}$ is defined as follows [3-5, 7-19]:

$$\underline{I}_{1k} = \frac{1}{3}\left(\underline{I}_{ak} + a\underline{I}_{bk} + a^2\underline{I}_{ck}\right); \quad \underline{I}_{2k} = \frac{1}{3}\left(\underline{I}_{ak} + a^2\underline{I}_{bk} + a\underline{I}_{ck}\right); \quad \underline{I}_{0k} = \frac{1}{3}\left(\underline{I}_{ak} + \underline{I}_{bk} + \underline{I}_{ck}\right) \tag{9}$$

Where

$$\underline{I}'_A + \underline{I}_a + \underline{I}_{ak}; \qquad \underline{I}'_B + \underline{I}_b + \underline{I}_{bk}; \qquad \underline{I}'_C + \underline{I}_c + \underline{I}_{ck} \tag{10}$$

Here, $\underline{I}'_A$, $\underline{I}'_B$, $\underline{I}'_C$ - represents the line currents after compensation, in amperes (A), and $\underline{I}_a$, $\underline{I}_b$, $\underline{I}_c$ - represents the line currents before compensation, in amperes (A).

The line currents after compensation must be symmetrical, that is: $\underline{I}'_A = I'_A$, $\underline{I}'_B = a^2 I'_B$, $\underline{I}'_C = aI'_C$ and $I'_A = \mathrm{Re}(\underline{I}_a)$, $I'_B = \mathrm{Re}(\underline{I}_b)$, $I'_C = \mathrm{Re}(\underline{I}_c)$.

By substituting expression (10) into expression (9), we obtain the following:

$$\underline{I}_{1k} = \frac{1}{3} j\left(I_a \sin\varphi_{iA} + I_b \sin\varphi_{iB} + I_c \sin\varphi_{iC}\right)$$

$$\underline{I}_{2k} = \frac{1}{3} j\left(I_a \sin\varphi_{iA} + aI_b \sin\varphi_{iB} + a^2 I_c \sin\varphi_{iC}\right) \tag{11}$$

$$\underline{I}_{0k} = \frac{1}{3} j\left(I_a \sin\varphi_{iA} + a^2 I_b \sin\varphi_{iB} + aI_c \sin\varphi_{iC}\right)$$

Where $\varphi_{iA} = \varphi_{uA} - \varphi_A$, φ_A – The difference in potential between the phase voltage and the current.

Expression (11) reflects the balancing effect in the capacitor bank. From the solution of this expression, it can be concluded that, with such a capacitor bank connection scheme, a zero-sequence balancing effect can be achieved. Moreover, the main problem of 0.4 kV networks is that the voltage unbalance factor of the zero sequence exceeds the permissible limit established by the national standard by 2-2.5 times. At the same time, the use of reactive power compensation devices can significantly improve the power factor [1-5, 7-19].

Discussion. Taking into account the proposed calculation methodology and the leveling effect, we will determine the economic efficiency of reactive power compensation in 0.4 kV distribution networks. A voltage drop in the line leads to an increase in active power losses in the transmission lines and step-down transformers. Active power losses in low-voltage electrical networks are determined by the following expression [3-5, 7-19]:

$$\Delta P = \frac{P^2 + Q^2}{U^2} R = \frac{P^2\left(1 + tg\varphi^2\right)}{U^2} R = \frac{P^2 R}{U^2} \cdot \frac{1}{\cos\varphi^2} \tag{12}$$

Where *P* and *Q* are the active and reactive power transmitted through the line; *U* is the line voltage, *V*; *R* is the equivalent active resistance of the line, Ω (where *R=rL*, with *r* being the internal resistance of the line, *Ω*, and *L* the line length, km); *cosφ* is the power factor; *tgφ* is the reactive power factor.

From expression (12), it is evident that, at constant values of the active power *R* transmitted through the line and voltage *U*, the power losses (*ΔP, ΔQ*) depend on the power factor (*cosφ*) and the line length *L*. *For example*, let us assume that, for the most rational case of calculating active power losses in a line, i.e., in distribution electrical networks with a voltage of 10(6)/0.4 kV, the calculations are carried out based on the condition that before compensation *cosφ*=0.85, and after compensation it approaches 1. Then, based on expression (12), the active power losses after compensation are calculated using the following expression [3-5, 7-19]:

$$\Delta P - \Delta P_k = \frac{P^2 R}{U^2} \cdot \left(\frac{1}{\cos \varphi^2} - \frac{1}{\cos \varphi^{2"}} \right) = \frac{P^2 R}{U^2} \cdot 0{,}38 \tag{13}$$

In this case, the line losses are reduced to $\frac{\Delta P - \Delta P_k}{\Delta P} \cdot 100\,\% = 27{,}5\%$. The active power losses in transformers consist of two components: *ΔP* - the active power losses consumed for heating the transformer windings due to the load current, and ΔP_{CT} - the power losses associated with heating the core during the flow of this current. From this, the power losses, consumed in heating the transformer windings, are determined using the following expression [3-5, 7-19]:

$$\Delta P = 3I^2 R_T = \frac{S^2}{U^2} R_T = \frac{P^2 + Q^2}{U^2} R_T \tag{14}$$

Then, the total active power losses are calculated as follows:

$$\Delta P_T = \Delta P + \Delta P_{CT} = \frac{P^2 + Q^2}{U^2} R_T + \Delta P_{CT} \tag{15}$$

Where R_T is the active resistance of the transformer windings, in ohms (Ω).

If the transformer's short-circuit losses are known - denoted as $\Delta P_{M.nom}$, the copper losses at nominal load as S_{nom}, and its actual load as *S* - then the active power losses are determined by the following expression:

$$\Delta P_T = \Delta P_M + \Delta P_{CT} = \Delta P_{M.nom} \left(\frac{S}{S_{nom}} \right)^2 + \Delta P_{CT} \tag{16}$$

On the 0.4 kV network side, when reactive power is compensated, active power losses are reduced and are determined as follows.

$$\Delta P_T^{'} = \Delta P_{M.nom} \left(\frac{S^{'}}{S_{nom}} \right)^2 + \Delta P_{CT} \tag{17}$$

Where

$$S^{'} = \sqrt{P^2 + Q^{'2}} = \frac{P}{\cos \varphi^{'}} \tag{18}$$

In this case, $\cos \varphi^{'}$ denotes the power factor after compensation.

After compensation, the change in power losses in the transformer is determined by the following expression:

$$\Delta P_T - \Delta P_T^{'} = \frac{\Delta P_{M.nom} \cdot P^2}{S_{nom}^2} \cdot \left(\frac{1}{\cos \varphi^2} - \frac{1}{\cos \varphi^{2'}} \right) \tag{19}$$

When the power factor increases from *cosφ*=0.85 to *cosφ*=0.95, the active power losses decrease to $\frac{\Delta P - \Delta P_k}{\Delta P} \cdot 100\,\% = 20\,\%$. Thus, when the transformer operates at full load, the power losses after compensation will be 20% lower than the copper losses before compensation. If the average value of power losses in the transformer winding (copper losses) is assumed to be 1.5%, then, with reactive power compensation, the losses in the transformer can be reduced to 0.3%.

Taking into account the symmetrizing effect of reactive power compensation, let us determine the reduction in active power losses. Since the current in the neutral conductor is equal to three times the zero-sequence current, expression (11) can be used to determine the extent to which power losses have been reduced after reactive power compensation.

Even when reactive power compensation is performed in only one phase of the line, the current value in the neutral conductor decreases to 1% (with the power factor cosφ varying from 0.85 to 1), which, in turn, leads to a reduction in active power losses by up to 2% compared to the mode without reactive power compensation. Thus, for the analyzed line, the total losses (including line losses, transformer losses, and all losses associated with voltage unbalance) are reduced by $27{,}5\% + 0{,}3\% + 2\% = 29{,}8\%$ compared to the operating mode without reactive power compensation [3-5, 7-19].

Conclusions. Based on the studies presented in the article, it has been established that in 0.4 kV networks with a low power factor, reactive power compensation can significantly improve such power quality indicators as steady-state voltage deviation and voltage unbalance factor. Using the proposed calculation methodology, the proper placement of reactive power compensation devices along the line ensures that the voltage level and the voltage unbalance factor comply with the regulatory requirements for electric power quality for all consumers. Active power losses in the electrical network are reduced by up to 30% compared to the losses observed before reactive power compensation. Moreover, the proposed solutions make it possible to enhance the efficiency of electricity transmission and consumption through power networks, increase the efficiency of electrical power transfer, and improve the economic performance of electric power enterprises.

IMPROVING THE MISSION FORMATION OF THE REGIONAL BUILDING MATERIALS INDUSTRY

Najimov I.P.
Karakalpak State University named after Berdakh

Summary: *The article examines the essence and formation of the mission for enterprises and the regional building materials industry. It reveals the growing relevance and necessity of ensuring objectivity in the mission content of enterprises and the building materials industry. It is determined that the mission content should take into account industry-specific features. The mission of the studied industry is formulated considering its subordination to the construction complex and the presence of enterprises utilizing natural raw materials.*

Key words: *building materials manufacturing enterprises, enterprise mission, industrial production under conditions of increasing variability and emerging new challenges*

Defining the essence and purpose of an enterprise or industry mission holds particular significance. There are numerous interpretations of this important concept. Based on the study of various literary sources and in agreement with many of their authors (Table 1), this article substantiates and presents our own interpretation, which, in our opinion, more adequately considers the peculiarities of the building materials industry.

Table 1

Interpretation of the "mission" concept in various scientific sources

Author	Definition
Vesnin V. R.	The mission unites people, ensures harmony in the company's interaction with the external environment, and helps determine positions and interests in relation to various social groups [1.18].
Vikhansky O.S.	Mission is the philosophy and purpose, the meaning of an organization's existence [2.24].
Zub A. T.	The main general purpose of the organization, the clearly expressed reason for its existence, its purpose. The corporate mission concept is a reliable element of the organization's ideological foundation [3.37].
Ward Keith	A mission statement is an organizational form that allows for the formulation of the company's main goals and their communication to everyone (employees, shareholders, consumers, suppliers, etc.) [4.63].
Fatkhutdinov R.A.	Mission - philosophy of existence, strategic goal, fundamental purpose of the organization [5.26]

It is evident that the status and structure of an enterprise or industry largely depend on the goals set, for the achievement of which they are created and function. Indeed, the goals of the industry, its development concept in the strategic plan, and the main directions and scale of its business activity characterize the future of the industry to which its activities are dedicated.

Undoubtedly, it is necessary to distinguish between general and specific goals. At the same time, *general goals* reflect the concept of industry development and are developed for the long term. *Specific goals* are subordinate to general goals for the main activities in each production department of the organization and can be expressed in quantitative indicators.

In essence, the common goals of the industry represent a domain for setting objectives for its production, financial, social, economic activities, and so on. Goals serve as the starting point for planning, control, and evaluation of the final results of economic activity. They form the basis for motivation systems and organizational-economic relations.

It should be noted that, in general, the goal-oriented aspect of industry activity reflects the aims and interests of various groups of people (owners, employees, business partners, consumers, society as a whole) related to the industry's activities and involved in its functioning process.

Depending on the sphere of activity and the specifics of the economic environment, each organization sets its own goals, which differ both in the set of parameters and in their quantitative assessment.

A properly organized process of goal formulation involves four main phases:

- *identification and analysis* of trends observed in the environment;
- *setting goals* for the organization as a whole;
- *establishing a hierarchy* of goals;
- setting *individual* goals.

The goals of an individual enterprise or an association of entrepreneurial structures can be understood as the goals pursued by the owners, i.e., the founders.

Undoubtedly, for many enterprises, profit is a necessary condition for their existence. However, profit is not the main and sole goal of any entrepreneurial venture or firm. Among their needs, spiritual needs such as self-employment and creating job opportunities for others, as well as self-realization through achieving set goals, are quite prominent.

Nevertheless, upon deeper examination of goals, activities, and attitudes towards results, one inevitably concludes that ultimately, thoughts and actions are based on nothing other than *the aspiration to attain higher social significance* through the effective operation of an enterprise that meets a certain societal need, thus fulfilling its assigned mission.

This leads to a truly profound understanding of the organization's mission, which can be considered the purpose of the firm's existence, but a purpose oriented not only towards itself but also towards society.

Thus, the mission represents the public service of the enterprise for which it exists in society.

The proper formulation and selection of the enterprise's mission, along with all employees' awareness of the set goals, are key to the collective's successful activity.

It should be noted that choosing an organization's mission is always the prerogative of not only the owner but also of top management.

An adequate mission allows for identifying the real and optimal trajectory of the enterprise's (or industry's) development.

The problem of formulating a mission is the problem of orienting activities.

When creating a creative, highly productive team becomes secondary, the effectiveness of activities declines and the organization perishes in competitive struggle. This was repeatedly noted by Kazuma Tateishi, who is one of the founders of the "Japanese economic miracle" [6].

To better understand the essence of a mission, we would like to provide an example from the high fashion sphere. When selecting candidates to showcase his products, a famous couturier was primarily interested not in their anthropometric characteristics, but in the inner world of future employees, asking questions about the last book they read, the performance they saw, and their favorite visual masterpiece.

In our understanding, the mission, being a primacy in organizing a new enterprise, outlines the contours of the enterprise's status and provides direction and guidelines for subsequent determination of goals and strategies at all levels of the management hierarchy.

Understanding the mission typically incorporates the following characteristics of the organization:

- sphere of activity and description of manufactured products (services);
- market characteristics (main consumers, clients, partners);
- technology (characteristics of equipment, technological processes, innovations);
- philosophy (basic views and values of the enterprise, industry);
- internal concept (opinion about oneself, factors and sources of development, increasing the level of competitiveness, etc.);
- The external image of an enterprise, its reputation, emphasizing its economic and social responsibility towards partners, consumers, and society as a whole.

The duration of a mission's existence can vary and depends on external factors and the specifics of the field of activity. The content of the mission must be reflected in the mission statement,

while the sequence and combination of its components may vary depending on the nature of the activity.

Thus, a mission is the purposeful designation of an organization (enterprise, industry), encompassing both internal and external benchmarks for which the organization exists and which should form the foundation of its activities.

We believe that the mission of an enterprise or industry represents a public objective function, which has certain limitations.

The particular significance of an organization's mission lies in the fact that it serves as a basis and support for planned decisions, defining its local and tactical goals and objectives. The mission ensures consistency, transparency, and interconnection of lower-level goals and horizons, coordinates the efforts of employees, unites their actions, and secures mutual understanding and support from shareholders, financial institutions, and others.

The dynamics and unpredictability of the modern market and economic development dictate their own conditions for business growth. Under these circumstances, a strategy is objectively necessary, and its development becomes the main task of planning. It should be noted that M.V. Bgashev adheres to the definition of strategy as a single comprehensive general plan for implementing the organization's mission and achieving its goals. In his opinion, the strategic advantage of an organization is its mission, which guides and optimizes internal resources [7.89].

Based on the author's research on the development of the construction materials industry in the Republic of Karakalpakstan, a preliminary selection of factors for the sustainable development of construction materials industry enterprises in Karakalpakstan was carried out (Table 2).

Table 2

Results of preliminary determination of factors influencing the effective development of building materials enterprises [8.19]

Direction for ensuring sustainable development	**Pre-selected factors influencing the sustainability of enterprise development**	**Results of preliminary selection**
Economic (organizational-economic)	Improvement of marketing activities of enterprises	+++
	Improving product quality	++
	Effective use of local raw material potential	+++
	Strengthening the material and technical base of enterprises	++
	Increasing the competitiveness of enterprises based on growth in resource efficiency	+++
	Innovative development of construction materials industry enterprises	+++
	Improving enterprise location	++
	Application of mobile enterprises	+
Social	Development of enterprise human resources	+++
Environmental	Ensuring environmental protection (environmental factor)	+++
	Effective use of local raw material potential	++

The priority of these factors was determined using expert survey methods (Table 3).

Table 3

Ranking of factors influencing the development of building materials enterprises building materials [8.20]

Indicators	**Experts**				**Sum**	**Arithmetic mean**	**Rank**
	E1	**E2**	**E3**	**E4**			
Development of enterprise human resources	0.6	0.4	0.3	0.5	1.8	0.45	5

Innovative development of building materials industry enterprises	0.8	0.8	0.7	0.6	2.9	0.725	1
Improving product quality	0.2	0.1	0.5	0.7	1.5	0.375	6
Effective use of local raw material potential	0.5	0.3	0.2	0.1	1.1	0.275	7
Strengthening the material and technical base of enterprises	0	0.2	0.1	0.2	0.5	0.125	8
Ensuring environmental protection (environmental factor)	0.3	0.7	0.6	0.3	1.9	0.475	4
Increasing enterprise competitiveness based on resource efficiency	0.4	0.6	0.8	0.8	2.6	0.65	2
Improving enterprise marketing activities	0.7	0.5	0.4	0.4	2	0.5	3
Improving enterprise location	0.1	0	0	0	0.1	0.025	9

Thus, the most significant factors in ensuring the effective development of building materials enterprises in Karakalpakstan are, in descending order of priority:

- innovative development of building materials industry enterprises;
- increasing enterprise competitiveness based on resource efficiency growth;
- Improvement of marketing activities of enterprises;
- Ensuring environmental protection (environmental factor).

Objectively, the composition of priority factors is not constant with the development of building materials industry enterprises and changes in the external environment; the composition and ranking of factors must undoubtedly be adjusted.

Taking into account the currently identified factors influencing the effective development of the industry, we believe that the industry's mission is as follows: The construction materials enterprises of the region are designed to provide the region's investment and construction complex with modern high-quality materials at acceptable prices in the most complete volume and within the required timeframe, while adhering to the requirements for environmental preservation and efficient use of raw materials.

It is planned that this version of the industry mission will be presented to regional governing structures for discussion and subsequent inclusion in regulatory documents.

The main conclusions are as follows:

The concept of "mission" for an enterprise (industry) acquires special significance in the context of increasing variability of external factors and growing challenges;

The essence of the concept of "mission" has its own specifics, depending on the characteristics of the industry, the variability of technologies, and the pace of the innovation process;

The construction materials industry, being a collective sector (comprising enterprises for extraction and enrichment of raw materials, processing of raw materials, and production of construction materials and products), "serves" the investment and construction complex and is designed to meet a number of requirements as part of the complex's material and technical base;

The industry, which includes mining and processing enterprises, is responsible for ensuring the rational use of natural resources;

The developed original interpretation of the industry's mission in construction materials production adequately and objectively reflects its characteristics and will allow for more effective implementation of the industry's activities.

EFFECT OF MICROCALCITE FINENESS ON THE PHYSICO-MECHANICAL PROPERTIES OF CEMENTITIOUS COMPOSITIONS FOR NON-AUTOCLAVED FOAM CONCRETE IN THE CONDITIONS OF THE REPUBLIC OF UZBEKISTAN

Soy V., Nuriddinova G., Takhirjanov N.
Tashkent State Transport University

Summary: *This article presents the results of a study on the influence of microcalcite fineness on the physico-mechanical properties of cementitious compositions for non-autoclaved foam concrete. Three microcalcite fractions (8,735, 3,350, and 1,441 cm²/g) were used in amounts of 5–15 % by cement mass. It was shown that finely dispersed microcalcite increases water demand but provides a 12.4 % rise in compressive strength due to microstructural densification and accelerated hydration. Medium- and coarse-grained forms reduce water demand through a particle-packing effect. The formation of carboaluminate compounds was observed, improving the density and durability of the cement stone. The use of microcalcite of varying fineness enables control over the structure and properties of cement systems, promoting the development of energy-efficient and environmentally sustainable formulations.*

Key words: *microcalcite; fineness; cement composite; foam concrete; water-to-cement ratio; carboaluminates; compressive strength; microstructure; energy-efficient materials.*

Introduction. The drive to reduce the "clinker factor" and adopt low-carbon formulations in cementitious materials has stimulated the widespread use of Portland-limestone cements (PLC) and CEM II-type composite cements with limestone additions. European and national standards (EN 197-1; GOST 31108–2020) permit incorporating 6–20% limestone (CEM II/A-L, II/B-L) and composite systems with multiple mineral constituents (CEM II/…-K), enabling CO_2 reductions without loss of performance when composition and grinding fineness are properly optimized [1.12-18, 2.4-7, 3.33-36].

Concurrently, there is growing interest in utilizing stone-processing wastes (marble powder/microcalcite, $CaCO_3$) as active mineral fillers. Recent reviews indicate that at moderate dosages (typically up to ~10–15% of cement mass), marble powder can maintain or improve selected strength and permeability metrics while lowering the carbon footprint through clinker substitution and a packing effect [4.215-222, 5.48-55].

The action of $CaCO_3$ is multifaceted: in addition to the physical "filler effect" (particle packing and provision of heterogeneous nucleation sites for hydrates), calcite chemically interacts with the clinker aluminate phase (C_3A) to form stable carboaluminate phases (hemicarboaluminate and monocarboaluminate). These reactions stabilize ettringite, increase the volume of hydrates, and can reduce early-age porosity [6.8-12, 7.852-857, 8.280-286].

However, the influence of microcalcite is governed primarily by its fineness and dosage. For cellular materials, including non-autoclaved foam concretes, finely ground $CaCO_3$ can additionally stabilize the foam and promote the development of a more robust structure during curing, making the selection of fineness and dosage critically important [9.42-45].

The aim of this study is to quantify the effects of microcalcite dosage (5–15 wt%) and fineness (three fractions) on standard consistency, water-to-cement ratio (w/c), and 28-day compressive strength of cementitious mixtures based on a composite Portland cement.

Materials and Methods

Materials. As the primary binder, a Portland cement CEM II/A-K (Z–I) 42.5 N produced by Akhangarantsement JSC (АО «Ахангаранцемент») was used. The cement had a specific surface area of 4,000–4,800 cm²/g and a true density of 3.1 g/cm³. The following active mineral fillers were employed:

Microcalcite ($CaCO_3$) — a waste product from marble crushing at the Kashkadarya quarry. Three microcalcite fractions were used—fine, medium, and coarse—with specific surface areas of 8,735; 3,350; and 1,441 cm²/g, respectively (Fig. 1).

a) fine fraction	b) medium fraction	c) coarse fraction

Fig. 1. Microcalcite of various fineness levels.

Prior to testing, all components were dried in a thermostatic chamber to a constant mass. After drying, the physical characteristics of each active component were determined using standard methods. The microcalcite additive was introduced in quantities ranging from 5 % to 15 % by mass of cement.

Mix Preparation and Standard Consistency

To determine the optimal amount of marble filler and the most effective fraction, experiments were conducted using various compositions (Table 1). The standard consistency of the cement paste was determined according to GOST 310.3–76 using a Vicat apparatus. Instead of the standard needle, a metal cylinder (10 mm in diameter and 50 mm in length) was employed. The total mass of the movable rod with the cylinder was (300 ± 2) g. Samples measuring 20 × 20 × 20 mm were molded and cured under normal conditions (temperature = 20 ± 2 °C, relative humidity ≥ 95 %).

Compressive Strength Testing

Compressive strength was measured after 28 days using a hydraulic press in accordance with GOST 7473–2010. The samples were cubic in shape. Before testing, the side dimensions were measured, and the cross-sectional area was calculated to an accuracy of 0.1 cm². The load was applied parallel to the settling surface of the mix at a rate of 0.2–0.3 MPa/s² until specimen failure. The average of three measurements was taken as the compressive strength limit (Rc, MPa), calculated using the formula:

Equation (1):

$$R_c = P / S$$

where *P* is the applied load and *S* is the cross-sectional area of the specimen.

Results and Discussion

Effect on Standard Consistency

The results showed that the introduction of active mineral fillers significantly alters the rheological and physico-mechanical properties of the cement system. The main evaluation criteria were the water-to-cement ratio (W/C) and the strength of the resulting compositions (Fig. 2).

Table 1. Results of Standard Consistency Tests for Mixes Containing Microcalcite

Mix No.	Composition	Water		Microcalcite		Penetration Depth, mm
		%	cm³	%	gr.	
1	Reference (C + W)	30	120	-	-	5
2	Fine microcalcite + cement	30	120	5	20	5

3		32	124	10	40	5
4		32,5	125	15	60	5
5	Medium microcalcite + cement	28,25	113	5	20	5
6		28,5	114	10	40	5
7		28,75	115	15	60	5
8	Coarse microcalcite + cement	28,5	114	5	20	5
9		28,75	115	10	40	5
10		29	116	15	60	5,5

An increase in the water-to-cement ratio (W/C) upon the addition of finely dispersed microcalcite is attributed to its high specific surface area and strong water adsorption capacity, which necessitate a higher liquid content to maintain the desired workability of the mix.

In contrast, medium- and coarse-grained microcalcite function primarily as inert mineral fillers, occupying the intergranular spaces between cement particles and thereby reducing the overall water demand.

The most pronounced reduction in water demand was observed with the medium-dispersed microcalcite, which provides an optimal balance between the packing effect and a moderate specific surface area, ensuring efficient particle distribution without excessive water absorption.

Mechanical Properties

The influence of microcalcite fineness on compressive strength is shown in Figure 2. Finely ground microcalcite (8,735 cm^2/g) yielded the **highest strength gain of 12.4 %** after 28 days compared with the reference mix.

This enhancement is attributed to:

- **Filler and nucleation effects,** leading to a denser microstructure and accelerated C–S–H formation.
- **Chemical interactions** with the aluminate phase (C_3A) to form stable carboaluminates:

Reaction (1):

$$C_3A + CaCO_3 + 12H \rightarrow C_3A \cdot CaCO_3 \cdot 12H$$

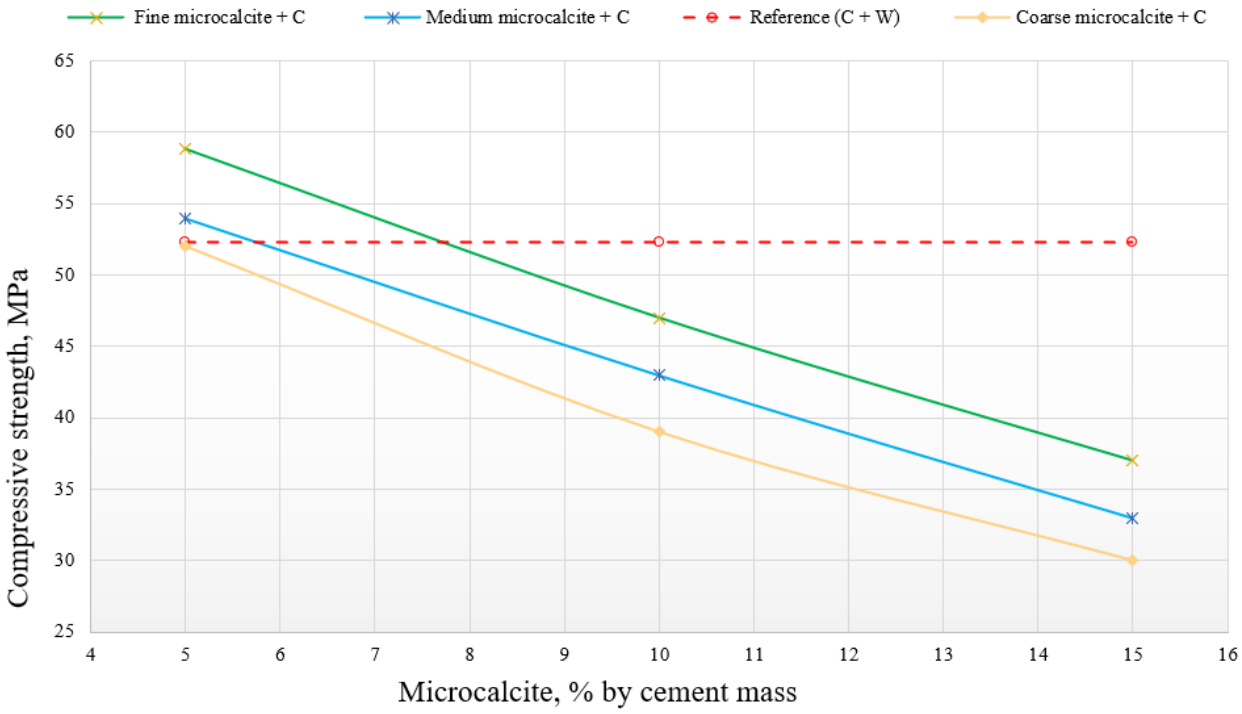

Fig. 2. Effect of microcalcite content and fineness on the compressive strength of cement mortar

These reactions stabilize ettringite, reduce free portlandite ($Ca(OH)_2$), and improve structural homogeneity.

Microstructural Interpretation

Finely dispersed microcalcite acts as a **micro-filler and reactive substrate**, enhancing strength but requiring more water.

Medium and coarse microcalcite primarily improve **packing density**, lowering water demand and maintaining adequate workability.

The combined effects lead to densification of the microstructure, reduced porosity, and improved durability, including higher frost resistance.

Conclusion

This study demonstrates that microcalcite fineness and dosage critically affect the rheological and mechanical performance of composite Portland cements.

Key conclusions are:

- Finely ground microcalcite (8,735 cm²/g) increases 28-day compressive strength by up to 12.4 %, though it slightly raises water demand.
- Medium-fineness microcalcite achieves the best balance between water reduction and particle packing efficiency.
- Microcalcite contributes chemically to the formation of carboaluminate phases and physically to the densification of the cement matrix.
- Optimized microcalcite use enables the design of eco-efficient, durable binders suitable for non-autoclaved foam concretes and other low-carbon applications.

Rezyume: *Ushbu maqolada mikrokalsitning disperslik darajasi noavtoklav ko'pikbeton uchun sementli kompozitsiyalarining fizik-mexanik xususiyatlariga ta'siri o'rganish bo'yicha olib borilgan tadqiqot natijalari yoritilgan. Unga ko'ra mikrokalsitning uch xil fraksiyasi (8735, 3350 va 1441 sm²/g) sement massasining 5–15 % miqdorida qo'llanildi. Aniqlanishicha, mayin dispersli mikrokalsit suvga bo'lgan talabni oshiradi, biroq mikrostrukturani zichlashtirish va gidratatsiyani tezlashtirish hisobiga mustahkamlikni 12,4 % ga oshiradi. O'rta va yirik dispers shakllar zarralar joylashuvi effekti tufayli suv sarfini kamaytiradi. Karboalyuminat birikmalarining hosil bo'lishi aniqlanib, ular sement toshining zichligi va mustahkamligini oshiradi. Turli disperslikdagi mikrokalsitdan foydalanish sement qorishmalarining tuzilishi va xossalarini boshqarishga imkon beradi hamda energiya tejamkor va ekologik barqaror tarkiblarni ishlab chiqish uchun sharoit yaratadi.*

Резюме: *В данной статье представлены результаты исследования влияния степени дисперсности микрокальцита на физико-механические свойства цементных композиций для неавтоклавного пенобетона. Использовались три фракции микрокальцита (8735, 3350 и 1441 см²/г) в количестве 5–15 % от массы цемента. Показано, что мелкодисперсный микрокальцит повышает водопотребность, но обеспечивает рост прочности на 12,4 % за счёт уплотнения микроструктуры и ускорения гидратации. Средне- и крупнодисперсные формы снижают водопотребность благодаря эффекту упаковки частиц. Обнаружено образование карбоалюминатных соединений, повышающих плотность и долговечность цементного камня. Применение микрокальцита различной дисперсности позволяет регулировать структуру и свойства цементных систем, способствуя разработке энергоэффективных и экологичных составов.*

Summary: *It is known that at the current time, a number of researches are being conducted in the world on obtaining high molecular compounds containing silicon and using them on an industrial scale. Organic compounds containing silicon differ sharply from other types of organic substances in terms of the improvement of some physicochemical properties. For example, in the future, research works in the field of synthesis of complex-forming sorbents containing silicon are being carried out at a rapid pace. The scope of use of organohybrid sorbents containing silicon is expanding day by day, including hydrometallurgy, wastewater treatment, drinking water desalination, in a food industry, in a air purification, as well as silver and a number of other precious metals.*

The synthesis of sorbents containing nitrogen, oxygen, and silicon and the scope of research aimed at the sorption of metals in complex solutions using them is expanding. In this regard, the synthesis, composition, and structure of complex-forming organohybrid sorbents and their physicochemical properties, sorption capacity, a study of the effect of various factors on sorption-desorption processes, separation of non-ferrous and precious metal ions in the hydrometallurgical industry with their help, wastewater treatment, as well as the use of various sorbents special attention is paid to determining the sorption abilities in environments with temperatures.

Key words: *silicon, organohybrid, sorbent, hydrometallurgy, sorption capacity, sorption-desorption, wastewater, silver.*

In several literature, the condensation reaction of urea and thiourea with formaldehyde in an acidic environment has been studied. The obtained products were tested as ion exchange resins and the ion exchange capacities of these resins were investigated[1].

Metal cations are the main pollutants of the lithosphere. Accumulation of serium in natural water resources can cause serious environmental problems. Another aspect is the accumulation of metallurgical waste. It had been studied as a raw material for the production of composite sorbents based on powdered and granular calcium aluminosilicates ($CaO\text{-}MgO\text{-}SiO_2\text{-}Al_2O_3$) capable of immobilizing cerium ions (Ce^{3+}) contained in metallurgical waste located near the city of Chelyabinsk, Russia. Aqueous solutions with a high concentration of Se3+ ions (1000 mg/L) were used during the experiments. The migration properties of calcium (Ca^{2+}), magnesium (Mg^{2+}), silicon (Si^{4+}), and aluminum (Al^{3+}) ions were studied. The separation rate of Se^{3+} ions in 24 hours was 93.36% for powder sorbents and 99.98% for granular sorbents.

The interaction of sorbents with sorbate had been carried out by the exchange of Ca^{2+} and Mg^{2+} ions from the sorbent matrix to an aqueous solution. The desorption process weres studied in distilled water. The results of the study showed a high degree of irreversible sorption of Se^{3+} ions from aqueous solution to powder and granular sorbents. The low cost of crushed metallurgical waste slag, environmental aspects of storage, and high sorption capacity made it possible to process this raw material and use it as a sorbent, then clean large natural objects from Se^{3+} ions [2].

Due to the sufficient amount of raw materials (ammonia, urea, thiourea, aldehydes, acrylonitrile) in Uzbekistan, the polycondensation process has been sufficiently analyzed in a large number of monographs and analytical scientific articles, and the technological parameters of this process have been developed [3].

The reaction of thiourea with various substances is reported in the literature, one of which, thiourea, reacts with epichlorohydrin violently at room temperature with heat evolution. In order to keep the rate of reaction of epichlorohydrin with thiourea uniform and reduce exothermicity, the

condensation reaction is carried out in the presence of a solvent. Ethanol, isoamyl alcohols, dimethylformamide, and toluene are used as solvents [4].

High efficiency in obtaining polymer sorbents was achieved when using isoamyl alcohol and dimethylformamide [5]. The reaction rate and polymer yield depend on the amount of solvent. The effect of thiourea and solvent mass ratio (0.5:1.0:1.5:2.0:2.5) on the duration of the condensation reaction and the properties of the anionic had been studied with all details. When 0.5-0.6 parts by mass of solvent are used per unit of part by mass of thiourea, the condensation reaction proceeds at a rapid rate and a brittle polymer with low mechanical strength is formed. An increase in the amount of solvent from 1.5 to 2.5 parts by mass are led to an increase in the reaction mass solidification time (100-120 hours). When one part by mass of solvent and thiourea is used, the condensation process goes and the obtained product has good mechanical strength, and also sufficient exchange capacity[6].

In the IR spectrum of the product obtained in a strongly acidic and neutral environment, there are almost no absorption lines corresponding to the epoxide group, which indicates that the interaction of thiourea with epichlorohydrin is due to the opening of the chlorine atom and the epoxide group in epichlorohydrin, and the amine group in thiourea is due to the interaction with the mobile hydrogen.

The results of describing the migration kinetics of Cu^{2+} ions in EDTA solution in an ionite matrix containing NH^{+}_{4} cations are presented. The imaging process was carried out using digital video technology, and the obtained data were processed on a computer using the Matlab 5.1 program. External and internal diffusion coefficients of ions were determined, and the exchange diffusion model of $Cu(NO_3)_2$ - NH^{+}_{4}, Na^{+}-H^{+}, Cu^{2+} - H^{+}- ion pairs in resin was described in the Amberlite IRC84 program [7].

The selectivity of sorbents had been studied in various studies in the synthesis of various precious metals. Several works of literature present a method for obtaining poly thiourea, which exhibits sorption activity against gold and silver [8].

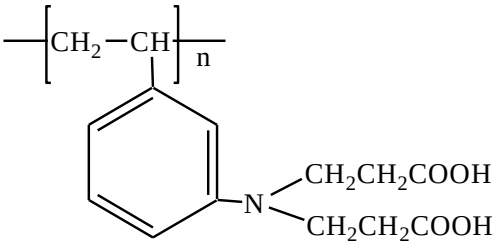
Synthesis and application of silicon-containing sorbents

Many scientists have studied the condensation reaction of urea and thiourea with formaldehyde in an acidic environment. The obtained products were tested as ion exchange resins and the ion exchange capacity of these resins was investigated [10].

In the synthesis of ion-exchange polymers, the polycondensation method is widely used to synthesize a heat-resistant high-molecular compound [11,12].

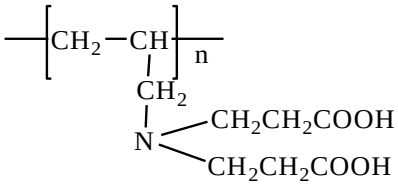
Modification of the surface of silicon microparticles with a large number of amino/carboxylic groups of polymer chains is an interesting way to obtain nanostructured composite materials for various purposes. In this case, four weak polycations (PK) polyethyleneimine (PEI), polylysine (PL), polyvinyl amine (PVA), polyallylamine hydrochloride (PAG), and one weak polyanion polyacrylic acid (PAK) were layered on a spherical layer to form composite microparticles. made of silicon dioxide. As a potential application of composite particles, the adsorption properties of simulated and real surface water to metal ions (Cu^{2+}, $Pb^{2+,}$ Ni^{2+}, and Fe^{2+}) were studied [13].

Synthesis of sorbents containing nitrogen, sulfur, and silicon and their application for water treatment



Since the independence of our republic, extensive measures have been taken to organize scientific research in the direction of developing new types of products in the chemical industry and to supply the local market with chemical reagents that can replace imports, and certain results have been achieved [14].

All minerals and synthetic sorbent materials containing silicon constitute a wide group of compounds with different physical, chemical, and technical properties [15]. All known sorbents containing silicon are divided into two main categories. The first natural and synthetic mineral carriers based on silicon dioxide and chemically modified products. The physicochemical properties and application of these materials are presented in many scientific works [16].



Based on polycondensation of p-nitrophenol, triethylenetetramine, and formaldehyde in the presence of 2 M NaOH, ion-exchanged polymers had been obtained. The resulting polymers have a selective chelating property in the sorption of metal ions such as Fe^{3+}, Cu^{2+}, Ni^{2+}, Co^{2+}, Zn^{2+}, Cd^{2+}, Hg^{2+}, and Pb^{2+}. The sorption of metal ions showed high selectivity in extracting Cd^{2+}, Hg^{2+}, and Pb^{2+}

ions when studied at different pH and ionic strength values of electrolyte solutions. The degree of separation of studied metal ions increases with the increase of hydrogen index in the medium [17].

Baranova N.V. et all. synthesized two types of chelating polymer ligands: 1– N-(2-carboxyethyl) amino polystyrene based on linear polystyrene and also 2 – N-(2-carboxyethyl)polyallylamine based on polyallylamine.

1) N-(2-Carboxyethyl) Aminopolystyrene

2) N-(2-Carboxyethyl) Polyallylamine

The dependence of the sorption of intermediate metal ions on the solution pH using the synthesized polymer ligands was studied from individual solutions of copper (II), nickel (II), and zinc (II) ions under static conditions. It has been found that the maximum sorption of intermediate metal ions in polymeric ligands occurs in the range of pH 5.5-7.5 from individual solutions [18].

Synthesis of chelating ionizing resins from polycondensation of o- and p-hydroxybenzoic acids with resorcinol and catechol in the presence of formaldehyde is described. The synthesis process was carried out in dimethylformamide at a temperature of 80 0C. The adsorption of cadmium (II) and lead (II) ions in synthesized resins had been studied[19].

Nowadays, in many research studies, great importance is attached to obtaining selective sorbents by the method of chemical modification of silica gel [20]. In particular, in [21], the synthesis of complex-forming sorbents by modifying orthosilicic acid with mono- and diethanolamines is presented as follows:

$$\equiv Si-OH + HO-(CH_2)_2-NH_2 \xrightarrow[-H_2O]{OH^-} \equiv Si-O-(CH_2)_2-NH_2$$

The possibility of extracting 137Cs, 90Sr, 90Y isotopes, and ions of d-elements such as Cu^{2+}, and Ni^{2+} from aqueous solutions are investigated in the work using large porous sorbents containing triethylenediamine.

The method of obtaining new, chelating sorbents with layers of nickel acetylacetonate, nickel-malon, and acetoacetic esters welded by the method of sequential arrangement of molecules on the surface of silica gel is presented. Their structure and chromatographic description have been studied using physicochemical methods.

Global production of synthetic ionite and sorbents has been increasing dramatically in recent years [22]. In terms of ionite production, the CIS countries are at the top of the world, while 65% of these ionites are used in hydrometallurgical industry enterprises for the concentration and separation of dissolved metals and water purification in various sectors of the national economy [23].

Selective sorption of phosphate arsenate and silicate anion compounds from aqueous solutions of ammonium molybdate and tungsten has been studied using a composite sorbent consisting of cationic KU-23 (or KM-2p) and hydrated zirconium oxide [24].

The optimal conditions for the condensation of oligomers of epichlorohydrin (EXG) formed with various amines with allyl bromide (AB) were studied. It was shown that when PEPA is used, the optimal reaction conditions are: temperature 500 °C, ratio of EXG:PEPA: AB components: 1:1:1. When polyetherimide is used, the temperature is 600 °C, the ratio: 1:3:1, and when hexamethylenediamine (GMDA) is used, the temperature is 700 °C, the ratio: AB:EXG: GMDA is 1:1:2 [25].

Based on gossypol resin, epichlorohydrin, and polyethylene polyamine, ionizing resins had been synthesized [26]. Using them, the properties of effective sorption of non-ferrous, precious, and heavy metal ions from technological solutions were studied using physicochemical methods [27].

A polyelectrolyte complex is obtained by dispersing the bentonite mixture with the product of the interaction of poly epichlorohydrin and diethylamine. Kinetic and diffusion properties of the K-GL blue dye sorption process have been studied [28].

It is important that the product obtained by condensation melamine with formaldehyde and epichlorohydrin with polyethylene polyamine has the property of separating rhenium and molybdenum ions. The total exchange capacity of the obtained anionite was 4.5-5.2 mg-eq/g, its relative viscosity was 80-100%, the weight of the powder was 0.7 g/ml, and the total amount of nitrogen in its content was equal to 20-25% [29].

Godjaeva A et al studied the reactions of dimethylamine with epichlorohydrin in aqueous and non-aqueous solutions [30]. In this case, a water-soluble polyelectrolyte was synthesized, and it was shown that the reaction yield depends on the influence of the initial substances in the molar ratio of the solution medium.

By polycondensation of EXG oligomers with amines in the presence of allyl bromide, polyfunctional polyelectrolytes were synthesized, and optimal conditions were determined. Their composition and structure have been thoroughly studied [31].

The leakage of harmful organic liquids into water resources has had a dangerous effect on living organisms. Here, the production of hybrid sorbents using s-PPG and an organosilane crosslinker is demonstrated. The final product showed high, fast absorption capacity, recyclability, and excellent separation of oil from wastewater. They also pick up a variety of oils from the bottom and surface of the water, even in harsh environments such as tidal environments and sub-zero water temperatures without changing their capacity. The results of the experiment showed that the obtained sorbents effectively remove oil from the water surface even under severe conditions and float on the water surface without loss of capacity or structural changes before and after oil sorption. The starting solvent, activator-free reaction medium, high and selective sorption properties, and high reusability can make these sorbents promising candidates for the purification of water from harmful organic liquids by absorption [32].

The presence of arsenic in water supplies has been a widespread problem for the past few decades. Inorganic arsenic ions in the natural environment occur mainly in two oxidation states, As(V) and As(III). These two oxidation states of arsenic ions are common in natural waters and pose a significant risk to human health when present at or above acceptable limits. Therefore, it has become more difficult to deal with arsenic ions based on various methods (for example, membrane filtration, adsorption, and ion exchange). This paper aims to review the current knowledge on different functional adsorbents by comparing the arsenic sorption potential based on key performance parameters, especially partition coefficient (BK).

In general, the new materials showed much better As(V) and As(III) sorption performance than the conventional materials. Among the materials considered, $ZrO(OH)_2$ improved sorbent such as carbon nanotubes (UNT) showed excellent performance with partition coefficient values of 584.6 (As(V) and 143.8 mol kg-1 M-1 (As(III) s). excellent renewability (>90% desorption efficiency after three sorption cycles. The results of this review are expected to help researchers develop an effective strategy for reducing arsenic ions in wastewater [33].

Copper, nickel, zinc, chromium, and iron ions are the main pollutants in wastewater [34]. In this context, we have studied here the sorption properties of metal ions in an ionic cryogel (IC) composed of inexpensive materials from renewable sources compared to multi-component metal ion solutions [35]. Chitosan matrix-based IK sorbent containing natural zeolite was synthesized using a simple strategy combining copper stamping and unidirectional ice stenciling. As a result, the one-dimensional orientation and interconnection of the current channels favor the fast diffusion of metal ions in the anisotropic IK structure. Selectivity studies were performed on binary, ternary, and five-component synthetic mixtures to evaluate the success of the formation of voids with well-defined dimensions controlled by the radius of copper ions used as templates. The effectiveness of IK as a sorbent was further evaluated in real water effluents from sorption processes; Thus, a dose of 6 g l-1 of IK can sorb 98.89% of Cu^{2+} ions, 94.56% of Fe^{3+}, 91.67% of Ni^{2+}, 92.24% of Zn^{2+} and 82.76% of Cr^{3+} ions from this type of industrial wastewater. defined [36].

Adsorption kinetics fit a pseudo-second-order model [37]. The maximum adsorption capacity of the sorbent for Pb (II) ion is more than 500 mg/g based on the Langmuir isotherm.

The amine-grafted aluminosilicate hybrid was initially processed by the sol-gel method through coagulation and polycondensation reaction. Subsequently, a spherical granular material had been produced by self-assembly after nano-casting. Two different hybrid granular sorbents, i.e., aminated bockmite (AB) and bockmite/silica (BK), were prepared and characterized for chemical, structural, and surface properties using FTIR, BET surface area, SEM, and zeta potential measurements. The adsorption efficiency of the obtained mesoporous sol-gel hybrid sorbents for Cr(VI) was systematically determined at different rN values, doses, concentrations, temperatures, and ionic strengths. Based on the experimental data, adsorption kinetics, and isotherms were studied and verified using standard models such as Lagergren pseudo-first and pseudo-second-order kinetic models and Langmuir, Freundlich, Sips, Redlich-Peterson, and Toth isotherm models. The adsorption efficiency of the hybrids has also been compared with conventional sorbents described in the literature [38].

Beknazarov Kh et all. researchers have synthesized oligomeric corrosion inhibitor compounds, and at the same time, it had been studied that many of them have also sorbent properties [39-43].

In order to comprehensively assess the removal of metals by sorbents in wastewater systems the effects of co-pollutants should be evaluated [44]. In this study, five low-cost sorbents were used to investigate the effectiveness of coconut husk fiber (HYoPT), blast furnace slag (BFU slag), waste tire rubber (ChShMK), biochar (BK), and iron-clad biochar (FeBC) on other pollutants (food substances and polycyclic aromatic hydrocarbons) were applied for simultaneous sorption of Cd, Cr, Cu, Ni, Pb, and Zn from conditioned stormwater sewage (IMS). HYoPT and YuO'Sh showed the highest sorption capacity of all metals in all systems (single and multi-contaminated) (removal > 95%). However, the presence of other contaminants in the solution decreased the metal removal for other sorbents in the following order (from highest to lowest): single metal > multi-metal > multi-contaminant solutions, and the metal removal efficiency was generally Cr~Cu~Pb>Ni>Cd>Zn. Humic acid (GC) had a negative effect on the sorption of metals, probably due to the formation of soluble GC-metal complexes; NaCl concentration did not affect the ion separation, but alkaline pH improved the removal. These results suggest that sorbents should be tested under real rainwater chemistry containing additional contaminants to properly characterize their performance before implementation [45].

Conclusion

Thus, the synthesis of silicon-containing organohybrid sorbents, development prospects, and modern problems of their use, as well as information and analysis based on the use of organohybrid sorbents in the world and in our republic, were studied. Analysis of the literature shows that today, obtaining various sorbents, including organic and inorganic components, with high sorption properties due to different functional groups, is one of the promising and important directions of the industry. The resulting organohybrid sorbents are widely used in wastewater treatment, heavy metal removal, and other industries. Based on the studied problems, obtaining sorbents is one of the important directions of science and industry.

Rezyume:. *Ma’lumki, hozirgi vaqtda dunyoning turli mamlakatlarida kremniy saqlovchi yuqori molekulali birikmalarni sintez qilish va ularni sanoat miqyosida qo‘llash bo‘yicha keng ko‘lamli ilmiy tadqiqotlar olib borilmoqda. Kremniy tutgan organik birikmalar ayrim fizik-kimyoviy xossalarining yaxshilanishi bilan boshqa organik moddalar sinflaridan keskin farq qiladi. Xususan, kelajakda qo‘llanilishi istiqbolli bo‘lgan kremniy asosidagi kompleks hosil qiluvchi sorbentlarni sintez qilish borasidagi ilmiy izlanishlar tez sur’atlar bilan rivojlanmoqda. Kremniy tutgan organogibrid sorbentlarning qo‘llanish sohasi tobora kengayib bormoqda: gidrometallurgiya, oqova suvlarni tozalash, ichimlik suvini sho‘rlikdan xalos qilish, oziq-ovqat sanoati, havoni tozalash, shuningdek, kumush va boshqa qimmatbaho metallarning ajratib olinishi kabi yo‘nalishlarda.*

Azot, kislorod va kremniy saqlovchi sorbentlarni sintez qilish hamda ular yordamida murakkab eritmalardan metall ionlarini sorbsiyalashga qaratilgan tadqiqotlar ham jadal rivojlanmoqda. Shu munosabat bilan kompleks hosil qiluvchi organogibrid sorbentlarning sintezi, tarkibi va tuzilishini o‘rganish, ularning fizik-kimyoviy xossalari va sorbsiya sig‘imi, turli omillarning sorbsiya–desorbsiya jarayonlariga ta’siri, gidrometallurgiya sanoatida rangli va qimmatbaho metall ionlarini tanlab ajratish, oqova suvlarni tozalash hamda turli sorbentlarning harorat sharoitlarida sorbsiya qobiliyatini baholash masalalariga alohida e’tibor qaratilmoqda.

Резюме:. *Известно, что в настоящее время во всём мире проводятся многочисленные исследования, направленные на получение высокомолекулярных соединений, содержащих кремний, и их промышленное использование. Органические соединения, содержащие кремний, существенно отличаются от других типов органических веществ благодаря улучшенным физико-химическим свойствам. В частности, в последние годы активно развиваются исследования в области синтеза комплексообразующих сорбентов на основе кремнийсодержащих структур. Область применения органогибридных сорбентов, содержащих кремний, стремительно расширяется и охватывает гидрометаллургию, очистку сточных вод, опреснение питьевой воды, пищевую промышленность, очистку воздуха, а также извлечение серебра и ряда других драгоценных металлов.*

Синтез сорбентов, содержащих азот, кислород и кремний, а также исследования, направленные на сорбцию металлов из сложных растворов с их использованием, получают всё более широкое развитие. В этом контексте особое внимание уделяется синтезу, составу и структуре комплексообразующих органогибридных сорбентов, их физико-химическим свойствам, сорбционной ёмкости, изучению влияния различных факторов на процессы сорбции-десорбции, селективному разделению ионов цветных и драгоценных металлов в гидрометаллургии, очистке сточных вод, а также определению сорбционных способностей различных сорбентов в средах при различных температурах.

Kalit so‘zlar: *kremniy, organogibrid, sorbent, gidrometallurgiya, sorbsiya sig‘imi, sorbsiya–desorbsiya, oqova suvlar, kumush.*

Ключевые слова: *кремний, органогибрид, сорбент, гидрометаллургия, сорбционная ёмкость, сорбция-десорбция, сточные воды, серебро.*

STUDY PHYSIC-CHEMICAL CHARACTERISTIC POLYMER APPLICABLE IN BORE SOLUTION

Abdukadirov F.B.[1], Kamalov DJ.K.[2]
[1]Tashkent University of architecture and civil engineering,
[2]Karakalpak State University named after Berdak

Summary:*In article are brought results of the study physic-chemical characteristic new copolymers synthesized on base departure to chemical industry and local raw materials resource. Using the modern methods of the analysis are shown polyelectroliting nature water solution copolymers, as well as are shown possibility of the using designed polymer for stabilization bore solution.*

Key words: *polymer, sand, ground, water solution polymer, filtering, water recoil, sediment, tixotroping, viscosity, density.*

Searching for, exploring the oilfields and gas in Republic Uzbekistan on new area, and growing of the depths of the boring definition objective need in improvement composition bore solution. Herewith used bore to syringe liquid must possess certain rheological, physic-chemical and technological characteristic depending on geological construction of the cut of the bore hole and mineralization opened by her plasting of water steadfast to influence aggressive fluids [1]. The nature applicable polymer renders On applied characteristic bore solution enormous influence.

As is well known [2], amongst enormous amount known natural and synthetic polymer only a few possess the ability open in water. For water solution polymer characteristic of presence in chain macromolecule gidrofilings of the functional groups (the gidroxil, carboxyl, amides, sulfur and others.). The degree dissociation water solution polyelectrolyte is connected with ion power of the solution. The form changes with change last macromolecule polyelectrolyte. Consequently, must be changed and their working, for instance, coagulation, flocculation characteristic and to distend. Increase the number of the kinetic units in solution as a result dissociation and change the form macromolecules polymer brings its gidrodinamicals characteristic about change. Consequently, viscosity and density of the bore solution must be such to with other technological factor and acceptance possible was provide sufficient antipressing on passable layers, but in ditto time she must not noticeably worsen the condition of the work chisel and field-performance dates productive horizon. Other word, in each concrete event must be chosen best values to viscosity and density of the bore solution. Density also is one of the main factors, providing stability wall bore holes.

In this aspect was of interest study physic-chemical characteristic designed by us on base departure water solutions polymers, which as we seem, can find broad using in prospect in preparation bore solution, especially firm to influence aggressive fluids.

As object of the studies were applying copolymers departure of the processes delintation grain cotton plant with GIPAN, as well as some waste chemical enterprise our republics such as - lignin, lignosulfonat and others product to reactions copolymerization departure of the processes delintationgrains cotton plant with GIPAN presents itself very viscous not hue or painted in amber color of the liquids, with specific scent, their physic-chemical features are completely identified.

The most wide-spread method is a determination to viscosity solution polymer. At study of viscosity powerfully diluted solution was discovered that many polymers, as from a certain "critical concentration" show the deflection brought viscosity from linear dependency. Usually in these cases extremums appear on crooked, reasons, which origin is concluded in electrostaticsrepulsive of the same name charged fragment macromolecules. In diluted solutioncopolymer ionized nearly completely, but because of relatively small quantity free carboxyl’s groups in its composition effect to ionizing not is too expressed. The study to dependencies to viscosity and pH from concentration solution copolymers and natural polymer has shown that with growing of the concentrations

copolymera in solution importance pH changes small (tabl.1). Several more concentration are reflected on importance's pHlignin and lignosulfonat that probably, is connected with different methods of their reception. The nature of the change to dependencies to viscosity from concentration in solution typed out to be alike. However sharp structuring in solution copolymera with akrylonitrilings fragment occurs in the field of greater concentrations that is caused, probably, difference in function composition and value of the molecular masses polymer.

Electronic-microscopic studies is installed that for solution resent preparecopolymer typical convolute type of the structure in the manner of formless unit, changing depending on concentrations copolymer, system in this case is homogeneous. Since time (for 5 hours) in system occurs the orientation, particularly in concentrated solution. Under the most further keeping of the solution (after 24 hours), appears the second type of the structure - an fibrilingover molecularing formation, due to that homogeneous system becomes microgeterogen. Probably, globulin types of the structure explanatory the small degree electrolytic dissociation functional groups and low their gidrotation. The aging copolymers and their solution are connected with to lather amides of the groups that can be confirmed by increase pH water solution with reduction of the concentrations.

Table 1

Change to specific viscosity and pH solution polymer depending on concentrations copolymer

№	Concentration solution polymer, %	copolymer		lignin		lignosulphonat	
		pH	viscosity η_{ud}	pH	viscosity η_{ud}	pH	Viscosity η_{ud}
1	0,005	6,0	0,10	7,1	-	-	-
2	0,010	6,0	0,12	7,1	-	-	-
3	0,05	6,1	0,14	7,1	-	-	-
4	0,10	6,1	0,16	7,2	0,1	0,11	0,08
5	0,5	6,2	0,20	7,2	0,11	0,12	0,09
6	1,0	6,4	0,22	7,4	0,12	0,12	0,1

Due to lather amides of the group in circuit macromoleculescopolymer appear the new functional groups, degree dissociation which in over and over again more, than amides of the groups. Because of electrostaticsrepulsive of the same name charged groups COO^- - macromolecules are rectified. Herewith the happy circumstances for arising the relationships between macromolecules that intensifies their mutual orientation and brings about shaping fibrils. Herewith, was installed that heating renders on process of the structuring in solution copolymers such influence, either as keeping. So, at half hours heating under 60ºC 10%- resent prepare solution copolymera exists such speedup fibril formed, as at keeping of the solution. The study change to viscosity and pH solution copolymers depending on concentrations has shown that they possess the fible acid a reaction, increasing with increasing of the contents copolymer in solution.

Beside water solution copolymer relative viscosity powerfully grows with increase the concentrations, anomaly to viscosity exists already in the field of powerfully diluted solution moreover for copolymera she denominated violent, than for lignin and lignosulfonat. The anomaly to viscosity copolymer, even powerfully diluted solution is conditioned presence in them over molecularing of the structures. Electronic-microscopic study lignin and lignosulfonat has shown that they are microgeterogen and consist of varied unit macromolecule - a globule and fibril. They united in units of the different forms, changing depending on concentrations of the solution natural polymer. In concentrated solution exist the clot to different density, with transition from high concentration of the happy circumstances to low for glue formed. The most further diluting brings about destruction gluing.

At keeping solution copolymers occurs sequencing a fibril structured element. For products 24-sentry of hydrolysis on electronic photomicrography of the solution, are seen filament, consisting of fibril. The appearance such fibrous structures (rectifying bunch macromolecule), probably, is conditioned by further hydrolysis amides groups in alkaline ambience, about than was spoken above.

In the course of study was installed that interaction designed by us water solutioncopolymer with dispersing particle depends on many factor: concentrations copolymer and mineral suspending,

presences electrolyte, temperature, salting and others amongst mineral suspending systematically and in detail studied soil and ground suspending, to convey from Navbakhor, Rishtan, Chust locality. So, influence designed by us copolymer in analogy with polyakrylamid (PAA) has shown that polymeric preparations enter in interaction with soil particle in consequence of which in suspending appears structure. pH soil suspending in whiteness of these polymer does not change that probably, is connected with buffer influence of ground on change the concentrations hydrogen ion in mixture.

The relative value of the volume setting soil suspending under influence synthesized us copolymers changes equally. However, in the event of industrial polymer PAA soil suspending more. Increase the volume setting with growing of the contents considered polymer changes not simbating at the speed of filtering. The last gets through minimum at concentrations of the polymer, equal 0,05% can be connected with that that under small concentration copolymer not all particles aggregation, remained particles occlude the times and hereunder decreases the velocity of the passing to liquids through layer setting. When all particles are bound, destruction brings about increasing of the velocities to filtering the fluid phase. As to designed water solutionpolymer, that here with increase the concentrations of the polymer and volume setting and velocity to filtering increase. Probably, this copolymer better sorption the soil particle. This is conditioned that that under influence polyelectrolyte, first, can occur peptization soil particles, and, consequently, occlusion of the times more small particle, secondly, filming to surfaces of the particles by polymer. Hereupon the happy circumstances for slide of the particles friend for friend and arising the thick packing, holding up passing of the fluid phase through layer setting. However if occurred peptization, volume, setting must was continuously decrease, dispersion ambience was turbid, but this does not exist.

Noted in experience reduction to specific viscosity filtrate ground in contrast with source solution lignin and lignosulfonat validates the second suggestion - occurs to envelop surfaces of the soil particles polymer. Granulometricalingcomposition of ground influences upon process of the splicing microagregats. The most friable precipitation form on background of the calcium chloride of the particle of ground of the different sizes in witness of copolymer.

The Method sedimentation analysis was studied influence synthesized us copolymer on dispersing different mineral suspending. The experiences conducted with 0,2% suspending, which in 24 hours after preparation added the solutions copolymer in corresponding to dosage. The influence studied in kinetics through 5, 10, 15 and etc minutes. It is revealed that degree dispersing change under influence copolymer and the other values, connected with size of the particles suspending. The balance is fixed already after 5 minute contacts suspending with polymer. Regardless of type of the mineral system radiusthe best likely particles it increases that is indicative of aggregation particles dispersing phases under influence of the polymeric additive. Aggregating dispersing of the phase occurs within optimum dosage of the polymer. The most further increasing to concentrations copolymer promotes increase dispersing and, accordingly, reduction of the value of the best likely radius of the particles that can be due to disintegration unit under influence polyelectrolyte and stabilization of the particles suspending.

Thereby, structuring in mineral suspending under influence copolymeris found in complex dependency from concentration copolymer.The results of the studies physic-chemical characteristic new copolymers, as well as their influence upon shaping firm to influence aggressive fluids unit have shown that designed by us copolymers in significant measure create the happy circumstances for provision of stability wall bore holes. They are revealed main applied, physic-chemical and rheological characteristic bore solution. The practical application of the development can, will solve many economic and technological problems to branches.

DEVELOPMENT OF A STATIC METHOD FOR CRUSHING VARIOUS ROCKS

Ravshanova M.X.
Navoi State University of Mining and Technology

Summary: *In this work, mathematical modeling of the process of high-pressure formation inside wells and boreholes using a non-explosive destructive mixture has been carried out, modern theories and concepts on non-explosive destruction of rocks have been studied, a new non-explosive destructive mixture with a new composition has been studied on rock samples in laboratory conditions, a new non-explosive destructive mixture has been developed using components made from local A method for separating monoliths from an array using a new, non-explosive destructive mixture has been developed., which has found application in industry.*

Key words: *Non-explosive destruction of rocks, non-explosive destructive mixture, borehole, borehole, mathematical modeling, high internal pressure, new composition of non-explosive destructive mixture, laboratory studies, components from local raw materials, method of separation of monoliths from the massif.*

INTRODUCTION

In the world, the universal and practically the only method of destroying strong rocks in the development of mineral deposits is drilling and blasting using explosive energy [1, 2]. This method remains the leading method in terms of productivity and lead time for the next 30-40 years, until new methods of destroying strong rocks using large capacities are invented [3-6]. The main disadvantages of the drilling and blasting method are insufficient provision of complete safety of blasting operations, interruption of mining operations and downtime due to ventilation of blasting facilities, a large amount of auxiliary work, insufficient use of explosive energy in unstable rocks, the release of a huge amount of dust and toxic gaseous products, the danger of storing explosives, etc. These disadvantages force the development of cheap and promising ways to destroy strong rocks. A promising direction for solving this problem is the use of a static method for the destruction of various rocks using non-explosive destructive mixtures (NDM) [7].

To date, more than 120 different mixtures and compositions of NDM are known worldwide, the main disadvantages of which are their importability, the difficulty of obtaining the composition, the use of rare and expensive substances as additives, long destruction time (12-24 hours), limited temperature conditions, limited application conditions, dependence on climatic and temperature conditions (for example, does not work in winter) [7]. In this regard, there is a need to conduct research on the development of cheap and high-quality NDM using components from local raw materials and shorter rock destruction time. To date, a number of scientific and practical works have been carried out in the Republic aimed at creating new types of NDMs using components from local raw materials, reducing the destruction time and simultaneously eliminating the phenomenon of spontaneous discharge of NDMs from boreholes and wells, and research is underway on the kinetics of self-expansion of NDMs based on inorganic compounds [8-9]. An analysis of the works devoted to fracture problems shows that the Griffiths-Irwin theory is most widely used in engineering calculations, which does not require a large amount of experimental data for calculation and satisfactorily describes fracture due to the growth of a single crack. This gives grounds to choose its provisions as the basic ones for solving the problems of rock destruction with the help of the NDM.

The main advantages of the NDM are the absence of dynamic effects on the destroyed object, the release of harmful gases, sound and other vibrations. The implementation of the method does not require the purchase of expensive special equipment or devices, the method can be implemented near transport and electrical equipment, while eliminating the possibility of damage due to the lack of separation of parts of the destroyed object. Currently, many methods of non-explosive destruction are known, but their industrial use is hampered by lack of equipment, low reliability, high energy consumption, dangerous effects on humans, and high cost. All these disadvantages force us to look for ways to create cheap and promising ways to destroy durable rocks.

When using NDM to obtain a continuous straight line of cracks in the rocks being destroyed, it is very important to determine the location of the bores. Their location and the formation of cracks in a straight line depends on the structure, strength and degree of extensibility of the rocks being developed. Cracks appear in the rocks after applying the NDM. These cracks are formed as a result of chemical and physical reactions of the applied composition NDM. Cracks can form anywhere in the hole and develop in any direction.

The formation of a gap is investigated as a result of the action of tangential stresses σθ at point A located in the plane of the gap at an equal distance from neighboring bores (Fig. 1). It has been established that radial stresses from neighboring bores, geometrically folded in a plane intersecting the gap perpendicular to it at a distance from neighboring charges, play an essential role in the mechanism of gap formation. These stresses also create tensile forces in the plane of the slit, and it is necessary to know the energy costs of sliding the walls of the slit after the formation of the main crack. A gap occurs in the array under the action of tensile stresses σθ at point A and symmetrical, directional tensile stresses at points C and C1, formed as a result of the geometric addition of radial compressive stresses σp at these points (Fig. 1).

As a result of the conducted analytical and theoretical studies, a formula has been developed for determining the effective distance between holes when using NDM, which allows for an even separation of the rock mass.:

$$a_k = d_c\left[\frac{2P(t)(0{,}85+\frac{\mu}{1-\mu})}{\sigma'_p+\sigma_h}\right]^{2/3}, \text{ м}, \quad (1)$$

where dc – the diameter of the well, m; P(t) – compressive stress caused by the action of the NDM at the wall of the contour well, MPa; μ – the Poisson's ratio; σ'p– the ultimate tensile strength of the rock, taking into account the coefficient of structural weakening for this massif, MPa; σh–additional stresses required to move the walls of the contour slit by a certain amount hsh, and its opening, MPa.

In the scientific laboratory of the Navoi State Mining and Technological University, experiments were conducted to find the optimal formulation of the NDM composition, which would speed up the hydration process without additional heat generation and ensure high pressure for 5-8 hours after using the composition.

NDM was selected for the destruction of rocks, concrete, reinforced concrete, masonry, as well as as an expansion additive for the production of grouting materials.

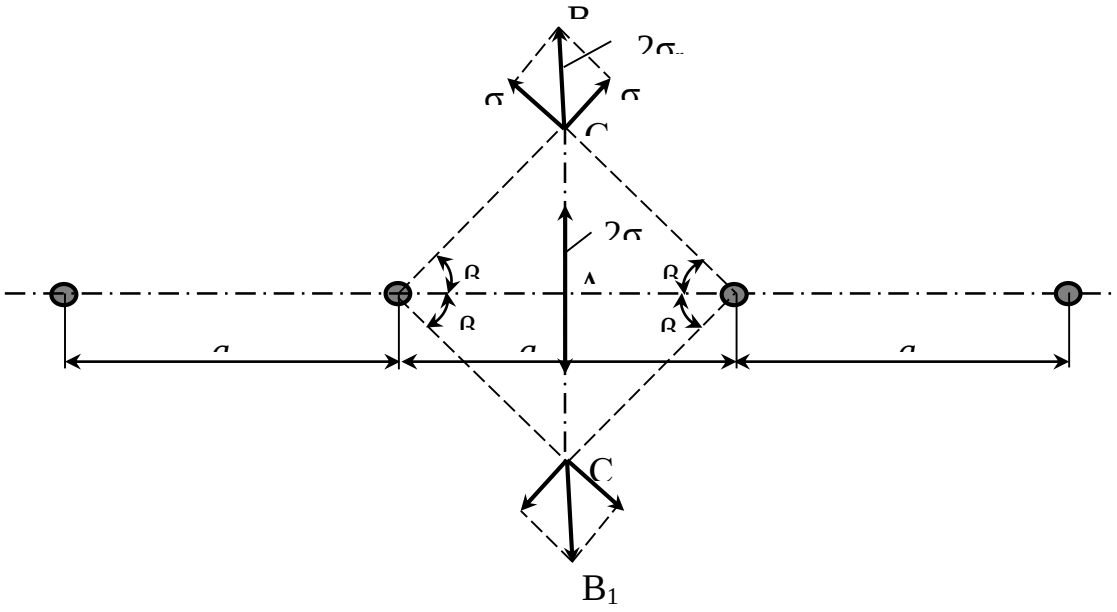

Fig. 1. Diagram for calculating the distance between wells with NDM

As a result of the conducted research, the following approximate chemical composition of the expanding non-explosive mixture was selected:

CaO – 9-90%;
Mr – 0,97-1,66%;
Fe2O3 – 3,4-7%;
CO3 –0,33-0,65%;
Al2O3 –1,34%;
CuO2 – 2%;
Na2O2 – 4%.

5 NDM formulations were compiled, by weight.%:

1) calcium chloride – 1.0-10.5; calcium carbonate with sugar waste content – 5.0-20.0; quicklime – the rest;

2) aluminum powder – 0.25-0.30; glycerin – 3.0-15.1; soda ash – 2.0-9.9; technical upgraded lignosulfanate (LSTM-2) – 0.10-2.35; calcium oxide from calcined limestone and gypsum – the rest;

3) potassium permanganate – 1.45-9.5; ethylene glycol – 5.0 – 21.0; boric acid – 0.25-2.7;

4) urea – 1.8-23.0; glycerin – 2.6-12.8; calcium oxide from calcined limestone and gypsum – the rest.

5) The composition of the NDM -1 mixture, developed by JSC "Budnikov All-Russian Scientific Research Institute of Building Materials and Structures", the main component (up to 98%) of which is calcined coarse lime. The firing of quicklime was carried out in furnaces of a special design at temperatures exceeding 1400°C. As a dobThe wok used boric acid, soda ash, and a chemical called sulfate-yeast mash (SYM). NDM -1 powder mixed with water in a 3:1 ratio formed a paste-like mass, which increased its volume upon solidification, creating a pressure of up to 50 MPa in the destroyed object.

Based on the above chemical compositions, optimal options have been selected in which the chemical mixture can expand as much as possible and lead to the destruction of glass, gypsum models, bricks and marble.

To identify the optimal formulations of NDM mixtures, the data presented in Table 1 were used.

Table- 1

NDM train options

NDM composition, wt. %				The pressure of self-expansion, MPa, aged		The presence of involuntary discharge of NDM from the hole
CaO	Na2CO3	LSTM	CH3COOH	12	24	
98,40	1	0,35	0,25	48	58	Blowout

the prototype				60	63	Blowout

In subsequent experimental work, more than 200 experiments with glass penicillin bubbles were performed. Only after obtaining repeated results on the rupture of glass bubbles, gypsum models, bricks and marble bars with pre-drilled holes were used.

Laboratory tests were also carried out in samples from various composite materials and the uniaxial compressive strength of gypsum block, ceramic brick, marble and glass samples was

determined. After obtaining the necessary experimental results, statistical processing was performed and the corresponding physical and mechanical parameters were obtained.

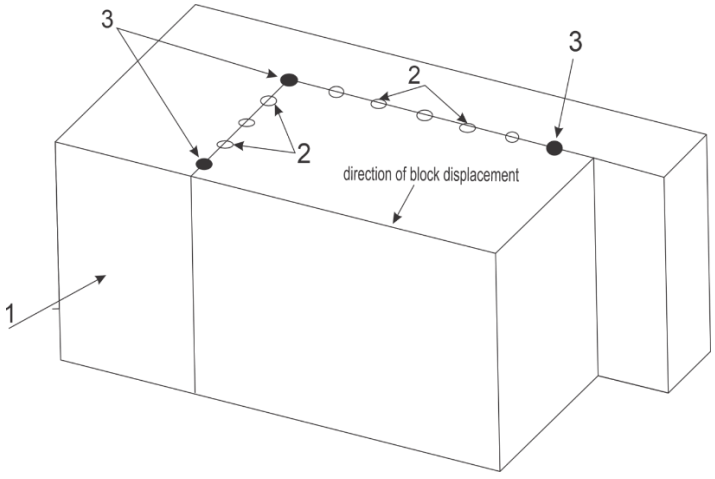
As a result of the research, a method for obtaining LDC has been developed, providing for the separate preparation of solid (S) and liquid (L) formulations. The solid composition is obtained by grinding lime (CaO) to a powdery state, mixing the resulting powder with soda ash (Na2CO3), lignosulfonate (LSTM) and technical salt (NaCl) at the following weight ratios. %:

– CaO – 48;
– Na2CO3 – 3;
– LSTM – 3;
– NaCl – 4.

It turns out to be a grayish loose mass.

The liquid composition is obtained by mixing liquid soap, water and acetic acid with the following components, by weight. %:

– liquid soap – 1,5;
– acetic acid – 1,2.
– water is the rest;



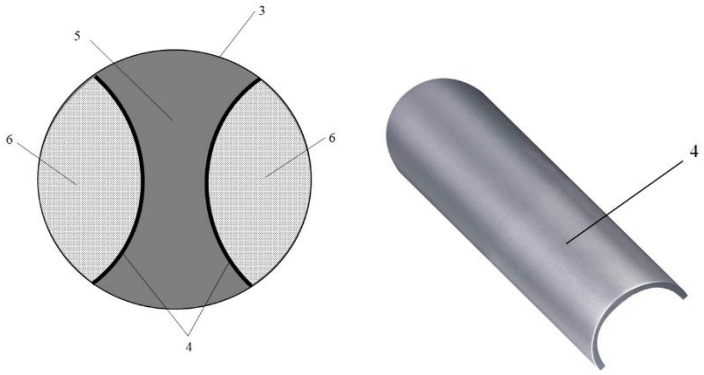
Solid and liquid compositions in the ratio S:L =3:1 is mixed until a creamy, flowing mass is obtained and, without allowing it to solidify, is poured into boreholes or boreholes. The time of rock fracturing is in the range of 6-8 hours, depending on the ambient temperature.

The developed new composition of the NDM is recommended to be used to separate monoliths from the mountain range and to split them into appropriate blocks.

A method for separating monoliths from an array using a new NDM composition has been developed (fig. 2).

According to this method, bores – 2 and 3 with a diameter of 32-43 mm are drilled in monolithic block – 1 at a right angle, and thus a mining ledge is formed at an angle of 90 ° to obtain blocks of monoliths of the correct shape and their further use..

The depth of bores 2 and 3 depends on the height of the monolith being separated and its ability to split. For better crack formation in the monolith and more efficient separation of the array, the depth of the bores should be on average 0.8-0.95 of the height of the object, but not less than six hole diameters and not more than 1.5 m.



1 – monolithic block; 2 – drilled holes from the NDM; 3 – drilled holes with NDM and installed metal arc-shaped plates

Fig. 2. A method for separating monoliths from an array using a new composition of a non-explosive destructive mixture.

The distance between the holes is determined by the formula (1).

In the lateral bores – 3, a stress concentrator is formed, consisting of two arc-shaped metal plates with an arc height equal to ½ the radius of the borehole, and an arc that are directed towards

each other at the places of the proposed split plane between adjacent boreholes, the space between the boreholes and the arc sphere is filled with downhole material, and the space between the tops of the arcs and all other boreholes is completely filled NDM (fig. 3).

3 – side contour spur; 4 – metal arc-shaped plate;
5 – non-explosive destructive mixture; 6 – slaughter material

Fig. 3. Construction of a side contour hole with metal plates of an arc-shaped shape

The displacement of the monolith block into the depleted space occurs under the influence of high self-expansion pressure, eliminating the involuntary release of the mixture. This eliminates the cost of additional rafter work and increases the safety of mining operations.

In industrial conditions, research has shown that the use of a new composition and method makes it possible to create high internal pressure in boreholes, contributing to the static destruction and rupture of rocks.

Thus, the theoretical and experimental studies carried out to develop a new composition of the NDM, and the practical implementation of their results in open–pit mining operations made it possible to make a significant contribution to solving an urgent scientific task - the scientific justification and development of a static method for rock destruction using NDM from local raw materials for use at open-pit mining facilities.

SCIENTIFIC BASIS FOR THE APPLICATION OF VARIOUS SUPPORT METHODS IN CAPITAL AND PREPARATORY MINE WORKINGS AT GREAT DEPTHS

Nazarov Z.S., Buriyev Sh.U., Avazov A.N.
Navoi State Mining and Technologies University

Summary:.*The article highlights the scientific foundations of supporting capital and preparatory mine workings located at great depths. Based on the strength properties of rocks, the degree of fracturing, stability categories, and the depth of the workings, criteria for selecting different support methods have been developed. Moreover, the possibilities of assessing rock quality using the Q-rating method based on the Barton system and selecting an appropriate support type are demonstrated. The research results contribute to ensuring the stability of mine workings, increasing their safety, and extending their service life.*

Keywords*:Capital workings, preparatory workings, mine, mine workings, rocks, rock strength, fracturing, deformation, geomechanics, stability category, support, support system, anchor, pre-stressed anchor (PSA), shotcrete, reinforcement frame, steel mesh, arch support, combined support, yielding support, rock pressure, lateral pressure, tectonic fault zones, mining and geological conditions, horizontal stresses, vertical stresses, abutment pressure zone, stability assurance, safety, efficiency, service life, "support–rock" system.*

When applying different support methods, the strength properties of rocks and the depth of the working are taken into account. In this case, a dimensionless parameter [1] is used and is determined by the following formula:

$$\varphi = \frac{\gamma H}{R_{comp}} \qquad (1)$$

where:

γ– density of the overlying rock layers, t/m³;

H – depth of the working, m;

Rc – long-term compressive strength of rocks, t·s/m³.

If $\gamma H/R_{\text{comp}} \leq 0{,}1$ the rocks can be considered stable. For rocks exposed to atmospheric influence, when driving workings, a thin (2–5 cm) layer of shotcrete support is recommended.

If $0{,}3 < \gamma H/R_{\text{comp}} \leq 0{,}3$ the rock mass requires support. In this case, recommended support types include anchored and combined support.

If $0{,}3 < \gamma H/R_{\text{comp}} \leq 0{,}45$, support types without an inverted arch are applied: monolithic concrete, timber, flexible steel support. In addition, combined variants—such as anchored support in combination with monolithic concrete or steel support—can also be used.

The stability of ore and rocks depends on their strength, degree of fracturing, tectonic disintegration, sericitization, chloritization, and silicification. Rock stability is also influenced by the shape and size of exposed surfaces, their duration of existence, blasting operations, the distance to mined-out voids, and other factors [2].

For workings located outside the zone of influence of stoping operations, the choice of support type is determined based on the stability categories of ore and rocks. The classification of rocks by stability is given in Table 1.

Table 1. Classification of rocks by stability

Category	Degree of stability	Need for support depending on exposure area	Horizontal span, m
I	Very stable	No support required when exposed over areas of 1000 m² or more and stored for long periods	>22
II	Stable	Exposure up to 600 m² allowed; for long-term storage, support is only required in weakened zones	17

III	Moderately stable	Exposure up to 100 m² allowed; for long-term storage, support is required	7
IV	Unstable	Exposure up to 10 m² allowed; support is required for long-term storage	2
V	Very unstable	Unsupported exposure is not permitted	-

The exposure areas and spans given in Table 1 do not take into account many other factors affecting rock stability.

Additional characteristics of rock stability categories, depending on storage conditions and the degree of fracturing of the rock mass, are given in Tables 2 and 3. The choice of support type according to the stability category is presented in Table 4.

Table 2. Degree of fracturing of rocks

Degree of fracturing	Core recovery %	Structural weakening coefficient (Kso)	Indicators of fracturing and blockiness	
			Number of fractures per 1 m²	Spacing between fractures, m
Slightly fractured	80	0,4-0,5	0-8	0,35
Moderately fractured	45-80	0,2-0,4	8-15	0,15-0,35
Highly fractured	30-45	0,1-0,2	15-30	0,5-0,15
Crushed	30	0,1	>30	-0,5

Table 3. Stability of rocks by strength and duration

Degree of stability	Rock strength index	Duration of self-support	Conditions for working preservation
Very stable	16-20	Unlimited	No support required for long-term storage
Stable	10-16	Up to 6 months	For long-term storage, support required only in some places
Moderately stable	6-10	Up to 0.5 months	Unsupported exposure permitted, but after some time support required
Unstable	3-6	1–3 days	Support must be installed simultaneously with excavation
Very unstable	<3	-	Unsupported excavation is not permitted

Table 4. Recommended support types depending on stability category

Stability category	Type of support	Interaction with rocks	Recommended support
Very stable (I)	Unsupported	Support bears no load	-
Stable (II)	Unsupported (in rocks susceptible to weathering – isolated protection)	No load on support, occasional local disintegration possible	Thin shotcrete coating for long-term exposure in weathered rocks
Moderatey stable (III)	Reinforcing	Consolidates surrounding rock, prevents displacements of loosened rock	Shotcrete; various types of rock bolts; combined support (bolts + shotcrete or mesh)

Unstable (IV)	Supporting	Works under collapse and stratification regime	Steel arch support; monolithic concrete; combined (bolts, mesh, reinforced shotcrete); timber support
Very unstable (V)	Bearing ("support–rock" system)	Works jointly with the rock mass in a deformation regime	Special transitional methods: yielding supports combined with protective supports, or rock injection

For capital and preparatory mine workings and their intersections, the international Q-rating method based on the Barton system can also be applied [3, 4].

The Barton system is used in empirical design methods to evaluate the stability of rock masses and the support conditions of deep mine workings.

The Q-value is determined as follows:

$$Q = \frac{RQ\Delta}{J_n} \cdot \frac{J_r}{J_a} \cdot \frac{J_w}{SRF}, \qquad (2)$$

where:

RQD– Rock Quality Designation index;

J_n – joint set number;

j_r – joint roughness number;

j_a – joint alteration number (joint wall alteration and filling);

j_v – water reduction factor;

SRF – stress reduction factor.

The ratio RQD / j_n represents the block size of the rock mass. Its limiting values range from (100 / 0.5) to (10 / 20).

The ratio j_r / j_a characterizes the shear strength along joint surfaces. It depends on the roughness of joint walls, the properties of filling material, and its grain composition. The most favorable values occur when joint walls are rough and weathering along the contact is weak.

The ratio j_v / SRF is the active stress coefficient.

Here, j_v expresses the influence of groundwater pressure, which reduces shear strength of rocks by decreasing the normal stress component.

The stress reduction factor SRF is applied in cases where:

1. Shear zones exist in clay-bearing rocks;
2. Intact rocks are subject to high stresses;
3. Weak or yielding rocks are subjected to squeezing loads (see Figure 1).

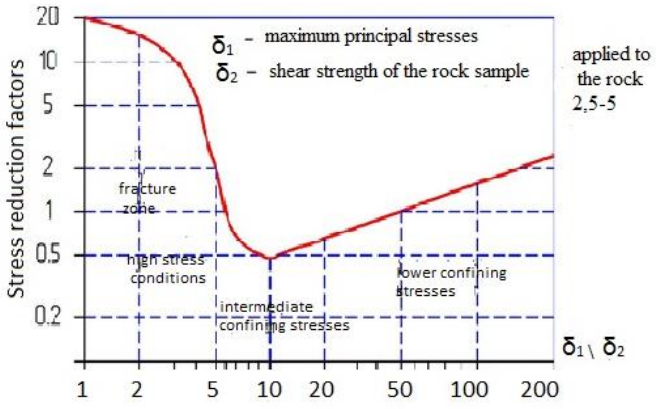

Figure 1. Stress reduction factor.

Table 5. Rock mass quality classification according to Q-system

Class	Rock quality	RQD
A	Very poor	0-25
B	Poor	25-50
C	Fair	50-75

D	Good	75-90
E	Excellent	90-100

Based on the research, a nomogram has been developed to determine support types according to the Q-system, shown in Figure 2.

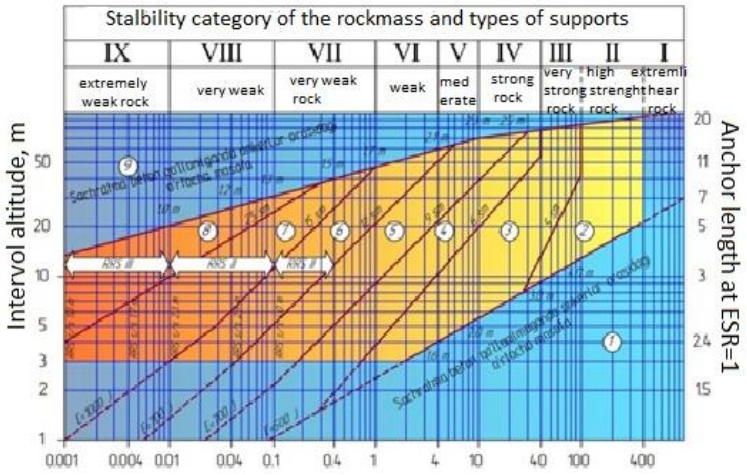

Figure 2. Diagram for selecting support types and parameters according to Q-rating (the hatched areas are not experimentally validated).

The interpretation of support types in the diagram is as follows:

1. No support or only occasional rock bolts.
2. Occasional rock bolts + shotcrete (SB).
3. Systematic bolting + fiber-reinforced shotcrete 5–6 cm (B + Sfr).
4. Systematic bolting + fiber-reinforced shotcrete 6–9 cm (B + Sfr, E500).
5. Systematic bolting + fiber-reinforced shotcrete 9–12 cm (B + Sfr, E700).
6. Systematic bolting + fiber-reinforced shotcrete 12–15 cm + Category 1 reinforcement frame (B + Sfr, E700 + RRS1).
7. Systematic bolting + fiber-reinforced shotcrete 12–15 cm + Category 2 reinforcement frame (B + Sfr, E1000 + RRS2).
8. Monolithic concrete or systematic bolting + fiber-reinforced shotcrete >25 cm + Category 3 reinforcement frame (SSA or B + Sfr, E1000 + RRS3) — special assessment required.

Additional parameters of the diagram are interpreted as follows:

E– Energy absorption class of shotcrete, determined by panel test results. The method is described by the Norwegian Concrete Association and summarized in Table 6.

Table 6. Energy absorption classes of shotcrete

Energy absorption class	Minimum absorbed energy, J	Required additives	
		Polypropylene fiber (kg)	Steel fibers, length ≤32 mm, diameter ≤0.5 mm (kg)
E500	500	5	15-18
E700	700	6-7	20-25
E1000	1000	8	30-35

The Excavation Support Ratio (ESR) describes the type of excavation, its intended service life, and cross-sectional shape (Table 7).

Table 7. Excavation Support Ratio (ESR) values

№	Excavation type	ESR		
1	Temporary workings, etc	3-5		
2	Vertical shafts, circular cross-section Rectangular/square cross-section (may be lower)	2,5 2,0		
3	Permanent mine workings, hydropower tunnels (except high-pressure shafts), pilot drifts for large chambers	1,6		

4	Small road and railway tunnels, sewer tunnels, etc	1,3		
5	Residential and storage facilities, water treatment plants, large road and railway tunnels, tunnel intersections	1		
6	Underground nuclear power stations, railway stations, sports and public facilities, factories, etc.	0,8		
7	Special-purpose tunnels, long-term (≈100 years) or maintenance-free tunnels	0,5		

When $Q \leq 0{,}1$, it is recommended to adopt ESR = 1.0 for excavation types 2, 3, and 4.

Reinforcement frames (RRS I, II, III) – and similar supports with equal load-bearing capacity (shotcrete + rock bolts with strips, shotcrete + bolted mesh arches, or shotcrete + fully bolted steel mesh) are special support types composed of steel profiles, anchors, and sprayed shotcrete combinations (Figure 3, Table 8).

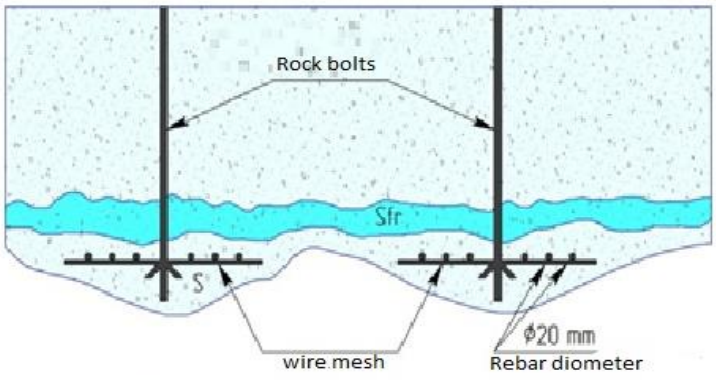

Figure 3. Installation scheme of support with RRS reinforcement frame.

Table 8. Adaptation of rock stability categories to Q-rating according to mining regulations (KTE)

Reinforcement frame category	Description by Q-rating	Equivalent load-bearing reinforcement
I	Si30/6 Ø16–Ø20 (spacing 10 m); D40/6 + 2Ø16–20 (spacing 20 m)	steel strips 2–5 mm thick, 300 mm wide
II	Si35/6 Ø16–20 (spacing 5 m); D45/6 + 2Ø16–20 (spacing 10 m); D55/6 + 4Ø20 (spacing 20 m);	lattice arches
III	D40/6 + 4Ø16–20 (spacing 5 m); D55/6 + 4Ø20 (spacing 10 m); D70/6 + 6Ø20 (spacing 20 m);	fully welded steel mesh 2000×1000 mm

Si – single layer reinforcement.

30/6 – reinforcement layer of 6 bars, shotcrete thickness 30 mm.

D – double layer reinforcement.

Ø16– reinforcement bar diameter.

s/s – spacing between reinforcement frame centers (see Figure 2, Q-rating diagram).

ConclusionClassification of rocks according to the Q-rating system includes 9 categories, which allows a more flexible selection of support types for mine workings compared to the 5 stability categories adopted in the Mining Technical Operation Regulations (KTE). This provides improved adaptability in choosing appropriate support systems depending on geological and geomechanical conditions.

COMPARATIVE ANALYSIS OF AIDARKUL BASALTS WITH BASALTS FROM OTHER REGIONS TO IDENTIFY REGIONAL GEOCHEMICAL CHARACTERISTICS

Rashidova R.K.
Navoi State University of Mining and Technologies

Summary: *This article is dedicated to the development of cost-effective lining thermal insulation materials (LTIM) based on local resources – basalt, kaolin, and chamotte. The results of research on selecting the optimal proportions of components, ensuring high thermal insulation performance, mechanical strength, and thermal stability, are presented. The developed LTIM can be successfully used in various industries, including metallurgy, chemistry, and energy, to reduce heat losses and improve the energy efficiency of equipment.*

Key words: *Kaolin, Chamotte, Mineral Raw Materials, Refractory Additive, Crushing, Grinding, Screening, Drying, Firing, Olivine, Pyroxene, Plagioclase, Structural Change, Thermal Effects, Heat Treatment*

INTRODUCTION

Thermostable refractory products are currently in high demand among private entrepreneurs and are used for low-capacity metal-melting furnaces for light metals. Refractory products make up a significant share of the ceramic materials of various purposes produced in Uzbekistan. In this regard, to meet the needs of industry—particularly the metallurgical and chemical sectors—large-scale scientific research is being carried out on refractory thermal-insulation materials (RTIM).

The main requirement for RTIM in this case is their refractoriness. A distinctive feature of using refractory products in metallurgy is the presence of different types of linings with various characteristic properties determined by the raw materials used.

In this case, we are referring to the mixture of mineral compounds proposed by the author of the dissertation, consisting of *basalt–kaolin– chamotte *. As noted in the first and second chapters of this dissertation, the high thermal resistance and refractoriness of basalt and chamotte minerals, as well as the strong binding properties and refractoriness of kaolin, served as the basis for choosing this composition for the production of lining heat-insulating materials for low-capacity metal-melting furnaces.

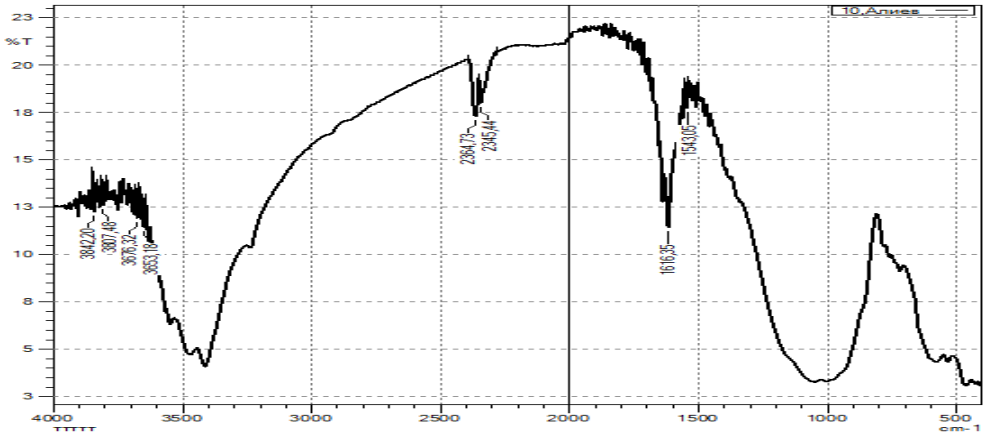
The analysis of the production needs of private enterprises shows that their demand for metallurgical melting equipment is not high, especially when it comes to the melting and use of light metals such as Al, Zn, Cu, Pb , and Ag in low-power furnaces. This is due to the high cost of such furnaces and lining materials. Their production process requires low cost, simple methods of raw material processing, and the manufacture of finished products with minimal technological and operational expenses relative to the volume of molten metal, which is very important for private entrepreneurs. Therefore, it is considered necessary to investigate the property characteristics of the local minerals proposed in this dissertation and their combinations.

The dissertation research is aimed at developing a technology for producing refractory lining materials for low-capacity melting furnaces intended for smelting non-ferrous metals. In accordance with the stated objective, this research primarily used domestic raw minerals—basalts from the “Aydarkul ” deposit and kaolins from the “Karnab” deposit.

Our joint comprehensive analysis of the chemical composition of basalts, carried out together with the Central Research Laboratory of the State Enterprise NGMK, showed that the basalt rock from the Aydarkul deposit contains up to 63.7% of SiO_2.

The high SiO_2 content in the Aydarkul basalts increases the melting temperature of the rock and leads to higher technological costs. Therefore, for casting-based production methods, the basalts of this deposit are considered ineffective.

This conclusion is supported by the fact that raw material extraction has been discontinued and the use of Aydarkul basalts has been abandoned due to the high cost of melting operations.



In the previous chapters of the dissertation, the idea was put forward of using a mixture of local mineral raw materials to develop a FTM technology for lining the inner faces of low-power metal smelting furnaces. This was necessary to determine the optimal ratio of minerals used for FTM production.

According to the existing standard technology, basalts are usually ground in laboratory grinding mills. The crushed raw materials are sifted on a vibrating sieve , the screenings are finished in the mills and partially in a ball mill to obtain a fine fraction. After dosing, the refractory additive components (kaolin and chamotte) are mixed in mixing mills and laboratory ball mills. The molded samples are dried in air and in a drying oven at 100-110 $^{\circ}$C. Mini-units were used in the studies: for crushing - DSh06, for grinding - MDSh and sieves with an opening size of 0.40-0.074 mm . The following raw materials were used in the experiment: basal-10, kaolin-10 and 10 (kg). Each mineral was processed separately. They were first crushed and then ground . Then they carried out screening with washing, drying and mixing, preparation of a wet thick mass, molding, drying and firing. Multiple experiments have proven that the basalts of the "Aydarkul " deposit contain more than forty chemical elements. It was revealed that the chemical composition of basalt rocks of the deposits has distinctive features compared to the data of basalts of other deposits in Uzbekistan. The final result of the chemical analysis was obtained after an experimental study of the spectral analysis of the basalt rock " Aydarkul " . The basalts of the " Aydarkul " deposit contain olivine in the range of 13.7 ÷ 18.7%, pyroxene in the range of 19.3 ÷ 23% and plagioclase - 34.6 ÷ 54%.

The main components of basalts are: SiO_2, TiO_2, Al_2O_3, Fe_2O_3, FeO, MgO, CaO, Na_2O. K_2OBasalt is a dense and extremely hard rock, with grain sizes of varying order. The study of the structural changes in basalts during thermal exposure was conducted by examining the thermal treatment of the rock, which is based on its inherent properties . tabl.

To determine changes in inorganic matter in basalts , IR spectrometry was used , which allowed us to determine the state of the structural features of basalt rock and its constituent materials. Figure 1.1 shows an IR spectrometry image.

Picture.1. IR spectra of "Aydarkul " basalts

To study the structural changes in basalts, the effects of thermal processing of the rock were studied, which is based on their inherent properties. Identification of substances by IR spectra is carried out by comparing the full IR spectrum of the analyzed substance with spectra available in the electronic library, as well as with the spectra of standards. The high resolution of the Nicolet 6700 spectrometer allows one to observe absorption bands caused by changes in the dipole moment of the molecule during rotation or vibration of its constituent atoms, isotopic substitution in the molecule, its symmetry, and the number of electrons in the outer shells. The absorption band at 737.0 cm $^{-1}$ is attributed to deformation vibrations of the bond $Si-O-Si$, and 474.1 cm $^{-1}$ to vibrations of the silicon-oxygen tetrahedron. Analysis of the IR spectra of the basalt melting product allows one to conclude that aluminum oxide completes the polymer tetrahedral network of the silicon-oxygen polyanion. and is presented in the form $[AlO_4]^{5-}$. In the studied material, iron oxide, just like aluminum, tries to complete the silicon-oxygen framework due to the lack of silicon oxide; in this case, iron oxide is mostly in tetrahedral coordination $[Fe^{2+}O_{4/2}]$.

The mineralogical composition of the basalts from the Asmansay deposit contains: olivine within 11.7÷23.7%, pyroxene within 17.3÷21% and plagioclase 31.6÷50.1%. The following chemical elements were not found in the studied samples of basalt rock from the Aydarkul deposit: Zn , Cd , Ag , Bi , Ge , Ti , Sb , W , Sn , In , As and P. The silicon oxide content in the basalts reaches 63%, such chemical elements as Ib , Li , I and Yb and J were not detected , etc. Overall, the analysis showed that the processing of Aydarkul basalts by melting is a labor-intensive and energy-intensive process with high technological costs.

It has been established that the multi- oxidation composition of basaltic rocks is due to the bonding forces between oxygen and the chemical elements of metals, which form a rigid crystal lattice. Particularly prominent are the bonds between oxygen and elements such as Al , Fe , Mg , K , N , Ti , and Si . The spectral analysis results presented in the table represent 24 chemical elements found in the Aydarkul basalts . Of these, the rock-forming elements are magnesium and sodium, silicon, iron, aluminum, and calcium; other chemical elements make up minor amounts in the rock .

Thus, the bond between oxygen and metallic elements leads to the formation of corresponding oxides, which form the basis of silicate basalt as a whole. In such a solid structure, the silicon-oxygen bond plays an important role, since the main part of basalt consists of the oxide SiO_2. The thermal impact of nabasalts , where the transformation of basaltic rock occurs, was studied using the derivatograms shown in Figures 2 and 3. A LabsysEVO Setaram device was used in this study. The heating temperature ranges from 50 $^{\circ}$C to 1200°C , while the heating rate is 5 $^{\circ}$C/ min .

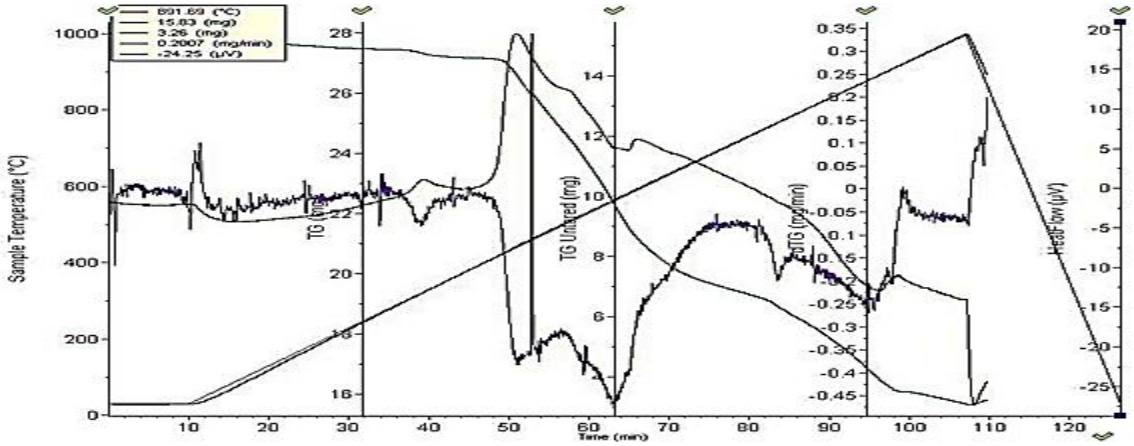

Fig. 2. Derivative diagram of the results of heat treatment of mineral raw materials Aydarkul

Table 1.

Experimental data of the derivatogram results

14	1050	11.4	19.35	0.915	5.36
15	1100	11.5	19.49	0.835	4.36
16	1200	15.3	22.3	0.635	3.35
17	1300	18.3	23.8	0.536	4.35

Based on the obtained derivatogram results , the samples were subjected to heat treatment at temperatures up to 100° C. A muffle furnace was used for the heat treatment . The endothermic effects of thermolysis, which occur at temperatures of 80–240° C, were studied. These effects indicate the decomposition of clay impurities and the removal of hygroscopic waters contained in the rocks.

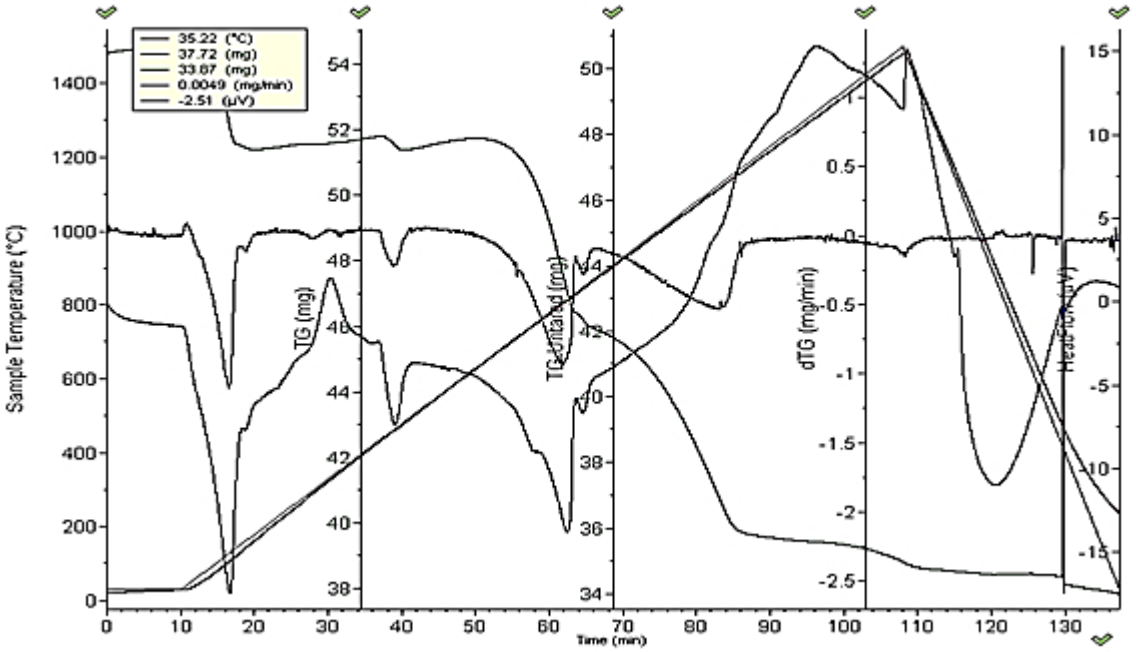

Fig. 3. Derivatogram of the results of heat treatment of basalt samples "Aydarkul "

Subsequently, at a temperature of 520 ° C, the effects weaken and the mass increases slightly, corresponding to the interconversion of the basalt components. The study of the thermal impact on basalts, where the transformation of basaltic rock occurs, is expressed through derivatograms.

In this study, a Labybsys IVO device was used, where the heating temperature reaches from 50 ^{0} C to 1200 ^{0} C. The heating rate is 5 ^{0} C/ min . Differential scanning calorimetry (DSC) (4), dynamic thermogravimetric curves (DTGA) (2) and TGP curves (3) of carbon-containing material .

The analysis of the DTGA curve shows that the curve consists mainly of two sigmoids , which occur in two stages. The first stage occurs in the temperature range from 150 ^{o} C to 700 ^{o} C, while the mass loss is 11.46%, the second stage occurs in the temperature range from 750° C to 1200° C , while the mass loss is 23.7%.

When heated to 600–900° C in an oxidizing environment, the iron monooxide contained in olivine oxidizes to iron oxide, and the olivine transforms into forsterite ($2MgOSIO_2$)and clinoenstatite ($MgOSiO_2$). At temperatures above 1200 ° C, iron oxide reacts with forsterite to form magnesium metasilicate. Magnesium metasilicate has four modifications, so their presence in refractories is impractical.

The study and analysis of the TGP curve shows that the decomposition rate of the carbon-containing material in the temperature range of 600-1080 ^{o} C is maximum and is 2.88 mg /min , and the amount of energy expended, accordingly , is 8.430 mv*s/mg. Differential scanning calorimetry (DSC) (4), dynamic thermogravimetric curves (DTGA) (2) and TGP curves (3) of the carbon-containing material .

With increasing temperature, the process of crystallization of amorphous products of the original raw materials occurs. In this case , as a result of the destruction of the crystalline structure of natural basalt, due to the heat treatment process, a second exothermic effect occurs in the temperature range of 820-840 ° C. This phenomenon can be explained by the discovery of three endothermic effects (at temperatures of 120-160 ° C, 335-375 ° C, 580-590 ° C, respectively) and two exothermic effects (at temperatures of 300-450 ° C and 700-720 ° C). It was established that the shape of the thermal curves is associated with the thermal insulation of the raw materials and with the characteristics of basalts from the Aidarkul deposits.

It should be noted that the temperature transitions of endothermic effects in the mixed material samples did not reduce the quality of the resulting FTMs. It was found that the difference in temperature transitions between FTMs also directly depends on the chemical properties of the materials and the mineralogical composition of the mixture made from Aydarkul basalts .

Based on the above theoretical studies, it can be concluded that Aydarkul basalts are quite suitable for the production of modern, next- generation refractory thermal insulation materials. The basalts studied are non-toxic, possess excellent physical and mechanical properties, increased resistance to acids and alkalis compared to mineral and glass fibers , low thermal conductivity, and a higher service temperature compared to other thermal insulation materials. These properties of Aydarkul basalts have determined the relevance of the further development and creation of highly effective thermal insulation materials and products for various industries.

THE INFLUENCE OF POLYGONALITY OF 3D MODELS ON THE PERCEPTION OF VIDEO GAMES: FROM STYLISTICS TO GAMEPLAY

Bakhtiyarov D.D., Dmitrieva I.V.

Summary: *This article provides a comprehensive analysis of the influence of low-poly and high-poly 3D models on the perception of video games, focusing on the contextual dependence of their visual perception. The study shows that the perception of educational polygonality varies depending on the spatial position of the model, which is confirmed by analogy: a model with 1000 polygons can be interpreted as highly polygonal in the depth of the scene, while in the foreground it is perceived as low-polygonal. The article traces the evolution of 3D graphics, starting with the first wave of graphics systems in games such as Tomb Raider (1996), and ending with modern projects where low-poly models are used as an element of stylistic expression, contributing to the creation of a unique gaming atmosphere, as can be seen in the example of The Walking Zombie 2 (2021).*

In addition, the author focuses on the economic aspects of development, pointing out the need to use low-poly models in conditions of a limited budget; this phenomenon is illustrated by the example of Minecraft, characterized by a breakthrough gameplay and open digital architecture, despite its visual simplicity. In conclusion, it is emphasized that in modern motion games, the importance of polygonality gives way to innovative concepts and the quality of the game immersion process, which is proved by multiple examples of successful and unsuccessful game projects.

Keywords: *low-poly models, high-poly models, 3D graphics, game perception, game atmosphere, budget constraints, innovative gameplay.*

First of all, it is necessary to analyze the key differences between low-poly and high-poly models in the context of three-dimensional graphics. In Russian-language terminology, these concepts are referred to as low-poly and high-poly.

Low-poly models, as illustrated in Fig. 1, are three-dimensional objects with a limited number of polygons, which results in a simplified geometric structure (see Fig. 2).

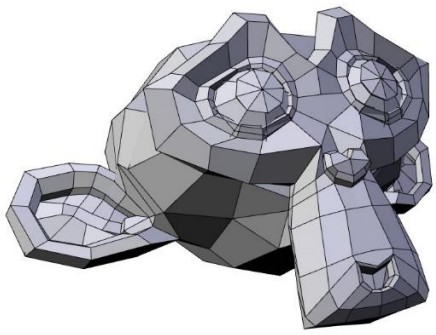

Fig. 1. Example of a low-poly monkey head — low-poly model

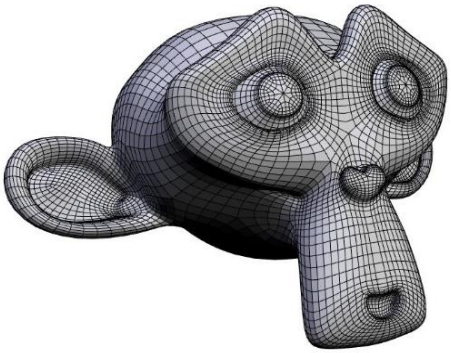

Fig. 2. Example of a high-poly monkey head — high-poly model

A polygon in this context is defined as a flat shape consisting of multiple vertices connected by edges that form the basic mesh structure of a model. This simplified form is often used in real-time environments, such as video games, where system performance and processing speed are critically important.

High-poly models, on the other hand, are characterized by a significantly greater number of polygons, enabling a high level of detail and realism. These models are widely used in static visualization, such as in film production and animation, where every detail is crucial and rendering resources are not a limiting factor. A high polygon count ensures more accurate representation of textures, lighting, and other visual effects, which in turn significantly enhances the viewer's immersion in the virtual environment.

However, there is no clearly defined set of parameters that determines when a low-poly 3D model transitions into a high-poly structure. These concepts are rather flexible and vary depending on the specific characteristics of a model and its functional role within a 3D scene ([1]) or within a video game.

As an illustration, a 3D model consisting of 1000 polygons could be classified as high-poly when positioned in the background of a "digital mise-en-scène." However, if the same model is moved to the foreground, it will be perceived as low-poly, since 1000 polygons would be insufficient to adequately convey all the visual details required of a primary object in the viewer's immediate focus.

Furthermore, this perception is significantly influenced by temporal context. During the early era of 3D video games and modeling ([2]), he game *Tomb Raider*, released in 1996, made a significant impact and was perceived as the pinnacle of human and computational capabilities. However, in the modern context, it appears less impressive and aesthetically appealing compared to games released in 2013 (Fig. 3), and even these later games cannot fully compete with the revolutionary achievements in the gaming industry that we observe today.

Fig. 3. Evolution of the character in the game Tomb Raider

[1] A 3D scene represents the integration of all three-dimensional objects and bodies present within the model..

[2] Моделирование представляет собой процесс создания модели как концептуального отображения определённого явления.

n the world of video games, the concept of low-poly graphics, based on the use of a small number of polygons, has undergone significant evolution and has become a distinct genre and style. This development was made possible by advances in computing technology, which enabled even basic personal computers and laptops to handle high-poly models and detailed 3D environments.

However, some developers are compelled to use low-poly models due to budget constraints. A prominent example of such a game is *Minecraft* (developed by Markus Persson and published by Mojang Studios), which quickly gained popularity among millions of players thanks to its unique mechanics and expansive game world ([3]), he game consists of simple cubic forms textured with 16×16 pixel raster images. In this context, a texture refers to a raster image applied to the surface of a polygonal model, giving it color, shading, or the illusion of relief.

In modern game design, the number of polygons is not always a determinant of success. Far more significant factors are the game's mechanics and narrative. In the case of *Minecraft*, the novelty of the concept was the key factor in its success, as there were no comparable games at the time. Attempts to replicate its success often failed because *Minecraft* had already secured a dominant position in the market. The presence of high-poly graphics is not a guarantee of a game's success. Many visually impressive projects, despite their high-quality graphics, are soon forgotten.

Low-poly games, such as *The Walking Zombie 2* (Fig. 4), released in 2021, use low-poly 3D models to create a unique atmosphere. In this case, the deliberate use of low-poly characters and environments serves to establish a specific mood, highlighting the importance of artistic choices in game design.

Fig. 4. The Walking Zombie 2

In summary, it can be stated that the success of video games does not depend solely on their polygon count. Low-poly games can achieve popularity through engaging narratives and original gameplay, while high-poly projects, despite their visual appeal, do not always guarantee long-term success. This emphasizes the importance of content and player experience, which can be more significant for gamers than graphics alone.

Rezyume: *Ushbu maqolada video o‘yinlarning qabul qilinishiga past poligonli (low-poly) va yuqori poligonli (high-poly) 3D-modellar ta’sirini kompleks tahlil qilish amalga oshiriladi, ularning vizual qabul qilinishi kontekstga bog‘liqligiga e’tibor qaratiladi. Tadqiqot shuni ko‘rsatadiki, modellar poligon soniga nisbatan qabul qilinishi ularning sahnadagi makoniy joylashuviga qarab o‘zgaradi, bu quyidagi analogiya bilan tasdiqlanadi: 1000 poligonli model sahna chuqurligida yuqori poligonli sifatida talqin qilinishi mumkin bo‘lsa, old fonida u past poligonli sifatida qabul qilinadi. Maqolada 3D-grafikaning evolyutsiyasi kuzatiladi, o‘yinlardagi birinchi grafik tizimlar davridan, masalan, Tomb Raider (1996), boshlanib, zamonaviy loyihalargacha, bu yerda past poligonli modellar stilistik ifoda elementi sifatida ishlatiladi va o‘ziga xos o‘yin muhitini yaratishga xizmat qiladi, bu The Walking Zombie 2 (2021) misolida ko‘rinadi.*

Резюме: *В данной статье проводится комплексный анализ влияния низкополигональных (low-poly) и высокополигональных (high-poly) 3D-моделей на восприятие видеоигр, акцентируя внимание на контекстуальной зависимости их визуального восприятия. Исследование показывает, что восприятие учебной полигональности варьируется в зависимости от пространственной позиции модели, что подтверждается аналогией: модель с 1000 полигонами может быть интерпретирована как высокополигональная в глубине сцены, в то время как на переднем плане она воспринимается как низкополигональная. Статья прослеживает эволюцию 3D-графики, начиная с первой волны графических систем в играх, таких как Tomb Raider (1996), и заканчивая современными проектами, где низкополигональные модели используются как элемент стилистического выражения, способствующего созданию уникальной игровой атмосферы, что можно видеть на примере The Walking Zombie 2 (2021).*

Kalit so‘zlar: *past poligonli modellar, yuqori poligonli modellar, 3D-grafika, o‘yinni qabul qilish, o‘yin muhit, byudjet cheklovlari, innovatsion o‘yin jarayoni.*

Ключевые слова: *низкополигональные модели, высокополигональные модели, 3D-графика, восприятие игры, игровая атмосфера, бюджетные ограничения, инновационный игровой процесс.*

OPTIMAL DESIGN OF THE COMPOSITION OF A COMPOSITE BINDING AGENT OF A DRY CONSTRUCTION MIXTURE AND A MORTAR BASED ON IT BY THE METHOD OF MATHEMATICAL PLANNING OF EXPERIMENTS

Abdireimova A.G[1]., Asamatdinov I.J[2].

[1]Student of Karakalpak State University named after Berdakh
[2]Associate Professor of the Department of Water Management and Land Use at the Institute of agriculture and agrotechnologies of Karakalpakstan

Summary: *The article presents the results of experimental studies on optimization of the composition of the composite binder of the dry building mixture (DBM) and the solution based on it for masonry and plastering works using the method of mathematical planning of experiments. It was established that the optimal values of the consumption of structure-forming additives: zeolite-containing rock of the Beltau deposit and the dosage of the chemical additive CWR in the composition of the composite binder DBM are 28% and 0.9% of the mass of the mixed binder, respectively.*

Key words: *dry building mix, solution, structure, cement, sand, zeolite-containing rock, optimization, regression equation, mathematical model, variable factors, output parameter, planning matrix, equation coefficients, properties, masonry mortar, plaster mortar, strength, compression, composition, ..*

1. Introduction

Improving technologies in construction, ensuring the durability and reliability of building structures of buildings and structures are placing increasingly high demands on the quality of materials used in their manufacture. In this regard, in modern construction practice, increasing attention is paid to the introduction of new effective materials for the construction and repair of buildings and structures, which can significantly reduce labor costs on the construction site and reduce material consumption while simultaneously improving the quality of the work performed. Such materials include dry building mixtures (DMB), which today are a product of high-tech technologies [1,2]. Depending on their purpose and the requirements for properties during their manufacture, factories easily change the composition and characteristics of building mixtures by introducing a complex of various additives. Cement, gypsum and other mineral binders are used as binders in building mixtures. At the same time, various types of cements are used more intensively as binders in dry construction mixtures. DM are considered to be more effective materials compared to traditional centrally prepared cement-sand mortars [3,4]. World and domestic experience in using dry mixtures has shown their high efficiency and advantages compared to traditional methods of work. DMB are fine-grained, thoroughly mixed compositions of dry components of a rational composition, which include binders, fractionated aggregates of a strictly defined quality, finely dispersed mineral components, chemical and polymer additives [5,6] . In the laboratory of building materials of the Tashkent State Transport University, the composition and technology for obtaining DMB have been developed for the production of masonry and plastering works based on local raw materials and materials. The composition of the DMB is multicomponent and includes the following materials and organomineral additives: Portland cement, mineral filler - zeolite-containing rock, quartz sand and plasticizing-air-entraining additive CWR (concentrated aqueous drainage). One of the most important tasks in the development of the composition and technology for obtaining DMB was the optimization of the composition of the composite binder DMB. To solve this problem, the authors conducted experimental studies using the method of mathematical planning of experiments.

2. Content

One of the main tasks of experimental research was to determine the numerical values of the parameters necessary to calculate the coefficients of mathematical models and confirm the adequacy of mathematical models. Traditional research methods are associated with

experimentation, which requires a lot of effort and money, since it is based on alternately varying individual independent variables under conditions where other variables are kept constant. The complexity of such an experiment is determined by the number of possible combinations of variable values (factors). Currently, experimental design methods are widely used in experimental research. Thanks to the optimal organization of experimental planning, it becomes possible, with minimal expenditure of material, time and human resources, to obtain all the information necessary to construct adequate mathematical models of the objects under study. The main objectives of experimental research are the experimental determination of the numerical values of the parameters necessary for calculating the coefficients of mathematical models, confirmation of the adequacy of mathematical models, confirmation of laboratory research. To predict the main properties of the DMB already at the stage of its design, appropriate regression dependencies of the main qualitative indicators of the DMB on its variable recipe and technological parameters are required [7,8].

When designing the composition and technology of DMB, you can use various mathematical methods, which can be divided into three groups: 1) probabilistic statistical methods, including the use of general probability theory, descriptive statistics, sampling method and testing of statistical hypotheses, variance and regression analysis, mathematical theory experiments, etc.; 2) methods of operations research, including linear, nonlinear and dynamic programming, game theory, queuing theory, graph and network theory, etc.; 3) methods of mathematical analysis, including differential, integral and vector calculus, differential equations, including equations of mathematical physics, used to compile and calculate mathematical models based on certain premises about the physical chemistry of the processes under study [9]. Thanks to the optimal organization of experimental planning, it becomes possible, with minimal expenditure of material, time and human resources, to obtain all the information necessary to construct adequate mathematical models of the objects under study. In this work, the technique of a full factorial experiment was used [9,10]. In this regard, the types and ranges of variation in the quantitative parameters of the modifiers used were determined. The goal of optimization is to determine the optimal value of cement binder consumption and optimal dosages of modifiers to obtain DMB with the highest strength properties.

2.1. Discussion.

Finding the optimal consumption of cement binder and the amount of zeolite-containing rock, as well as the optimal dosage value of the chemical additive CWR, is quite labor-intensive, due to the complex mechanism of action of the introduced structure-forming additives on the properties of the mortar. To optimize the values of these parameters, the method of mathematical planning of experiments was used in the work. The following composition indicators were taken as variable factors: consumption of Portland cement in the composite binder (X_1), amount of zeolite-containing rock (X_2), dosage of chemical additive (X_3), within the following variable limits: X_1 = 450-550 kg, X_2 =20-40%, X_3 =0.4-1.2. The ultimate compressive strength of a mortar based on DMB (Y_1 and Y_2) at the age of 3 and 28 days was chosen as an output parameter influenced by experimental factors.

In the experimental studies, the following were used: Portland cement CEM II/A-I 32.5 N produced by PC Akhangarantsement (GOST 30515-2020), mineral filler - river quartz sand from the Maysky quarry with a fineness modulus Mkr = 0.68 and an average density of ~2000 kg/m^3 (GOST 26633-2012), mineral filler - zeolite-containing rock of the Beltau deposit crushed to Ssp = 3000 cm^2 /g , chemical additive CWR - industrial waste from the production of caprolactam from toluene according to the method of the Italian company "SNIA-.P.D. » Almalyk chemical plant. Masonry mortars were prepared from the dry building mixtures obtained from the composite binder and sample beams of standard size 4×4×16 cm were formed in the amount of 6 pieces for each type of test. The samples were tested for compressive strength at 3 and 28 days of age after normal hardening in accordance with GOST 10180-2012.

The main characteristics of the experimental design are given in Table 1.

The experiment planning matrix and experimental results for the experiments are given in Table 2..

Table 1 Main characteristics of the experimental design

Experiment factor	Designation factor a	Lower level	Zero level	Top level	Step of variation
PC consumption, kg	X_1	400	450	500	50
Number of CBPBs, %	X_2	20	30	40	10
SVK dosage, %	X_3	0.6	0.8	1.0	0.2

Table 2 Experiment planning matrix in natural values

Experience no.	Experiment planning matrix			Ultimate compressive strength at age, MPa	
	PC consumption, kg	Number of CPBs, %	CWR dosage, %	3 days	28 days
1	400	20	0.4	12	21
2	500	20	0.4	16	24
3	400	40	0.4	11	18
4	500	40	0.4	15	22
5	400	20	1.2	10	20
6	500	20	1.2	14	23
7	400	40	1.2	10	17
8	500	40	1.2	13	21
9	350	30	0.8	14	19
10	550	30	0.8	17	25
11	450	15	0.8	13	19
12	450	45	0.8	12	16
13	450	30	0.3	16	19
14	450	30	1.3	14	17
15	450	30	0.8	15	20

The establishment of regression equations and the construction of graphical dependencies were carried out using the Maple18 application package. Taking into account the assessment of the significance of the coefficients of the regression equations, mathematical models of the output parameters of the following form were obtained:

$$Y_1 = 17.76 + 1.43\,X_1 - 0.22\,X_2 - 0.98\,X_3 - 0.29\,X_1^2 - 1.82\,X_2^2 - 3.03\,X_3^2 - 0.3\,X_1X_3 - 0.15\,X_2X_3;$$

$$Y_2 = 25.71 + 1.77X_1 - 0.81X_2 - 1.02X_3 + 2.07\,X_1^2 - 0.47\,X_2^2 + 0.16\,X_3^2 - 0.32\,X_1X_2 - 0.21\,X_1X_3 + 0.35\,X_2X_3.$$

The graphical dependences of the output parameters on the values of variable factors, constructed on the basis of the above mathematical models, are shown in Fig. 1.

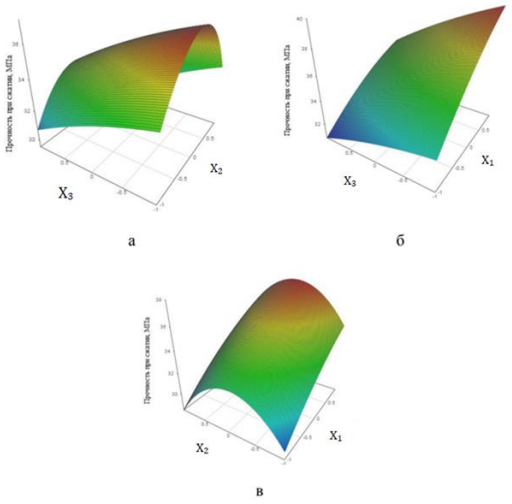

Fig. 1 Graphic dependences of the compressive strength of a building mortar based on DBM at the age of 28 days of normal hardening on variable factors

In addition, the periods of formation of the structure of the designed solution were analyzed (Fig. 2), and using the method of mathematical planning of experiments, adequate polynomial mathematical models of the second order were obtained, reflecting the change in the cubic strength of mortar samples after heat and moisture treatment relative to variable factors: preliminary holding time (X_1), rate of temperature increase in the chamber (X_2), temperature and time of isothermal heating (X_3, X_4): - after 12 hours after HMT:

- for a solution based on limestone sand: $R_{TBO}^{12} = 27 + 1.014X_1 - 1.362X_2 + 0.42X_3 - 1.054X_4 - 1.9X_1^2 - 1.27X_3^2 - 2.1X_4^2 - 1.23X_1X_3 - 1.45X_3X_4$.

- for a solution based on sand from crushed concrete scrap and with the addition of SP: $R_{TBO}^{12} = 26.2 + 0.8X_1 - 0.29X_2 + 0.64X_3 - 1.2X_3^2 - 1.9X_4^2 + 0.9X_1X_4 - 0.9X_3X_4 + 1.4X_1X_2$

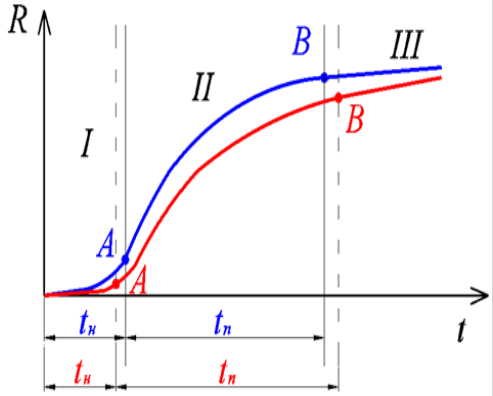

Fig.2. Main periods of solution structure formation

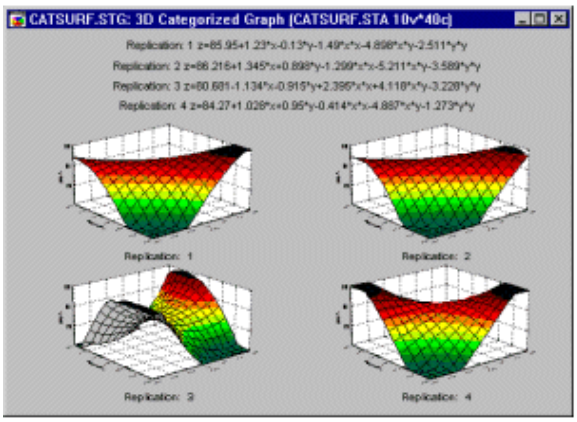

Fig.3. Response surfaces of mathematical models (at $X_{1,2,3,4}$ = const)

I-period of initial structure formation; II-period of structure strengthening; III-period of structure stabilization**.**

The obtained multifactorial mathematical models were analyzed by the graphical analytical method. In this case, using the computer program "Concrete.Technology", spatial images of the response surfaces of the output parameter - the strength of mortar samples after heat and moisture treatment from variable factors were obtained (Fig. 3).

3. Conclusion

Technological analysis of the obtained mathematical models was carried out using the graphic-analytical method [10]. The analysis found that the most significant variable factor influencing the compressive strength of mortar at the age of 28 days is the factor X_1 - consumption

of Portland cement, since the absolute values of the coefficients for the variables X_1 and X_1^2 turned out to be the largest. The values of the coefficients in front of the indicated variables indicate that the strength of the mortar increases beyond the specified range of variation of the variable X_1, which is quite natural.

The second most important variable factor in the mathematical model of the compressive strength of mortar is the factor X_2 - the consumption of cement-bonded particleboard. The values of the coefficients of the mathematical model at variables X_2 and X_2^2 shows that this factor is in the optimal zone. The optimal value of the consumption of CPB, determined by the method of functional analysis of the regression equation, in the specified range of variation in the physical dimension is 28% of the mass of the mixed binder. The least significant variable factor affecting the compressive strength of a mortar is factor X_3 - the dosage of the CWR additive. The values of the coefficients of the mathematical model at variables X_3 and X_3^2 shows that this factor is also in the optimal zone. The optimal dosage value of the CWR additive in the specified range of variation in the physical dimension is 0.9% by weight of the mixed binder. Thus, As a result of experimental studies, it was established that when varying the amount of binder from 400 to 500 kg, the compressive strength of the mortar increases by 25–30% at the age of 3 days, and by 15–20% at the age of 28 days. The optimal values for the consumption of CPB and the dosage of the CWR additive in the composition of the composite binder DBM are 28% and 0.9% of the mass of the mixed binder, respectively.

By means of functional analysis of mathematical models for extremum, the optimal parameters of the heat and moisture treatment mode of the solution based on limestone sand and secondary sand from crushed concrete scrap were determined. Taking into account these parameters, the following optimal mode of heat and moisture treatment of the solution using the used fine aggregates was established: 1+2+4+2 hours, at an isothermal heating temperature of 80 ^{0}C and a temperature rise rate of 25 ^{0}C.

THE IMPACT OF INNOVATION AND TECHNOLOGY IN THE DIGITAL ECONOMY

Allaniyazov P.A.
Nukus branch of Samarkand State University of Veterinary Medicine, Animal Husbandry and Biotechnology
e-mail: paraxatallaniyazov7@gmail.com

Summary: *This article analyzes the economic efficiency of using innovations. Innovation is an important factor in economic growth, increasing enterprise competitiveness by optimizing production processes, reducing costs, and improving product quality. The article discusses in detail the financial benefits, risks, and efficiency criteria of introducing innovative technologies.*

Key words: *Technological development, investment, competitiveness, production process.*

Introduction. Currently, innovation is becoming one of the most characteristic features of economic development. Not so long ago, this name reminded me of something exotic, unknown, and not very clear even among professionals, but now both innovation itself and its concepts are rapidly conquering the world. The international capital market, which plays a serious role in the innovation process and turns innovation into a strategic resource for enterprises, is expanding, and new financial structures are helping it in this regard.

The experience of developed countries shows that innovation is often hindered by people's direct negative attitude and position. However, a paradoxical situation is developing in Uzbekistan, where the entire society expresses a positive attitude and support for innovation processes.

In today's global competitive environment, the development of the tourism sector is one of the most important factors in the country's economic and social development. The rapid development of digital technologies is emerging as one of the main tools in the tourism industry to improve the quality of service, respond quickly to the needs of tourists, and ensure international competitiveness. This article analyzes the possibilities of expanding the use of digital technologies in the tourism sector of Uzbekistan, using the world experience.

Recently, the role of modern ICT technologies and innovations in the development of the national economies of developed countries has been increasing. Modern technologies allow for increasing the efficiency of production and labor processes in economic sectors. The term "digital economy" has entered the scientific field in recent years. The digital economy is an economy based on the application of information and communication technologies in the economic sphere. The digital economy also refers to economic activity based on digital technologies, including the Internet, mobile devices, and various software applications. It covers a wide range of sectors using digital innovations to improve productivity, efficiency, and connectivity.[1]

The goal of the research is to promote the innovative development of the economy and increase the potential and efficiency of the system through the creation of new entrepreneurs. The objectives of the research are to study the stages of increasing competitiveness and productivity in industry and to substantiate its specific features; to identify factors affecting the promotion of an increase in the share of high-tech products, increasing production, and increasing their share in the structure of production and exports, and expanding the use of innovative technologies and advanced management.

If we compare the innovation processes in our country with the situation in developed countries, the developed countries of the world have been under the influence of the innovation economy and the fifth technological cycle (long wave) for more than 15 years. What should countries that have just entered the fifth wave do, even after that?

Will they catch up with these countries by starting their scientific research in new high-tech areas first? It is clear that this is very problematic. However, this does not prevent these countries, in particular our country, from using technologies created by other countries and using them to develop

their economies, trying to overtake developed countries by creating as many conditions as possible for foreign investment to enter the country. Some time ago, this experience was carried out in Japan, South Korea, and other countries. Indeed, the opportunities provided by innovations and the positive aspects of globalization were captured, first of all, by the countries of Southeast Asia (often called "tigers"), such as South Korea, Taiwan, Hong Kong, Singapore, as well as the Celtic "tiger" - Ireland, which is one of the leaders in the field of innovations. These countries can serve as a paradigm for Uzbekistan, because our country, with its small market and poor traditional resources, can only develop successfully if it chooses an innovative path, using its unique non-traditional resources.[2]

The competitiveness of a country develops on the basis of the competitiveness of individual enterprises. Each enterprise uses its own strategy to achieve the advantages provided by competitiveness. However, the nature of the evolution and development of successful companies is similar, since companies create competitive advantages based on innovation. The reason for the weakness of innovation processes in the enterprises of our country is the influence of the following factors:

- low number of scientists working in industry, as well as low share of scientists and researchers in the workforce;
- lack of access to high-tech patenting;
- weak cooperation between the manufacturing sector and universities;
- relative failure of innovation promotion and entrepreneurship support mechanisms;
- complicated procedures for starting a business; insufficient quality of technological education.

The digital economy has become an integral part of global economic processes and an engine for the growth and development of companies. With the acceleration of the development of Industry 4.0, the world has entered the era of the digital economy led by a new generation of information and communication technologies.

The digital economy has eliminated barriers to the implementation of communications between market participants, ensuring the development of the domestic and international economy in the post-epidemic period. In the period of rapid development of the digital economy, its significance is manifested in its deep integration with economic and social sectors, promoting digital transformation, and the continuous introduction of new technologies, new models, and new industrial processes. This leads to the transformation and modernization of society, industry, and enterprises, contributing to sustainable economic development based on innovative models. In addition, as a result of economic and industrial restructuring, these innovations are triggering a new stage of technological revolution.[3]

In the process of collecting, storing, analyzing, and sharing information, digital technologies such as the Internet, cloud computing, big data, and blockchain are widely used, and social interaction methods are gradually changing. It should be noted that digital technologies are general-purpose technologies used in various economic activities. The basis of the digital economy is continuous innovation and great achievements in the field of information and communication technologies. The importance of the digital economy for the development of the economic system is determined in terms of increasing productivity and developing production relations, because the active development of the digital economy contributes to increasing efficiency and transforming the industry.

A new trend in the use of innovations has formed in the industry of Uzbekistan. Until now, industries related to the processing of natural resources using cheap labor have dominated. However, today Uzbekistan aims for a fundamentally new approach to the use of natural resources. A vivid example of this is the launch of the new UzGTL plant, which will produce high-value-added products based on the deep processing of natural gas. Thanks to such large-scale projects, Uzbekistan is gradually abandoning the export of natural gas raw materials and reducing the import of oil products. This indicates that a significant contribution is being made to strengthening our energy independence. This UzGTL complex, which is considered one of the largest investment projects not only in Uzbekistan, but also in the CIS countries, is also an example of innovative production. Also, one of the most modern and innovative in the CIS is the central control panel of the enterprise and the central

laboratory of the plant. The new enterprise will process 3.6 billion cubic meters of natural gas per year using GTL, that is, "gas-to-liquids" technology, and has the capacity to produce 1.5 million tons of finished products - jet fuel, diesel fuel, naphtha, and liquefied gas. So far, such a plant has been built in only 4 countries in the world - Qatar, Nigeria, South Africa, and Malaysia. Here, import-substituting petroleum products and hydrocarbon raw materials worth a total of more than 1 billion US dollars or 12.8 trillion soums are produced annually. The production of value-added products from natural gas based on GTL technology is carried out in three stages. Modern fuels prepared using this technology are environmentally friendly and clean. This, in turn, also corresponds to the principle of not harming nature, which has become an urgent issue today. Take GTL diesel fuel, for example. GTL diesel, which has high technical characteristics and contains almost no sulfur, does not emit significant emissions into the atmosphere. Similarly, GTL kerosene offers airlines a safe and profitable way to reduce their emissions.[4]

One of the main factors in the formation of the digital economy is described as innovation, an innovative idea and its product, innovative products. The reason for this is that initially, the emergence and development of innovative ideas and, as a result, the creation of new products (innovative products), have somewhat facilitated people's lives and created conveniences. When it comes to innovative products, the main focus is on artificial intelligence, supercomputers, smartphones, 3D printers, online shopping, internet communication, mobile communication, and IT parks. It is their invention and widespread use that has been called digital innovative technologies. This has created new markets (international online shopping, e-commerce, e-business). On this basis, the infrastructure of the digital economy has taken shape on its own. In particular, the initial emergence of computers, the establishment of mobile and internet connections, and, as a result, the emergence and development of e-commerce, international e-business, determine the level of influence of innovations in the digital economy. In the digital economy, innovation acts as a driving force that can transform new ideas into effective economic solutions. As we know, a lot of work is being done in our country to introduce and develop innovations and transition to a digital economy. However, there are still a number of problems in our country in this regard:

- ✓ the population's lack of a complete picture of innovation and the digital economy;
- ✓ the country's territory is not fully provided with ICT and Internet communication;
- ✓ the lack of specialists in innovation and the digital economy in the regions;
- ✓ the lack of research centers conducting research on innovations and digital technologies;
- ✓ the low number of users of existing payment systems (Click, Payme, m-bank, Humo, etc.) that allow for mobile communications, the Internet, public services, tax, and other types of online payments;
- ✓ the lack of online trading and trading platforms;
- ✓ the presence of problems with the introduction of digital technologies in all sectors and areas (computer literacy, lack of material base, lack of infrastructure);

Addressing the above problems will pave the way for the transition to a digital economy and the formation of its infrastructure.

In our opinion, in order to achieve positive results in the development of the digital economy, it is advisable to carry out the following work in our country:

- ✓ create a legal and regulatory framework for the formation of the infrastructure of the digital economy;
- ✓ hold conferences in places (in educational institutions, state organizations, and private organizations) in order to form an understanding of innovation and digital technologies among the population;
- ✓ Use the experience of advanced foreign countries in the formation of the digital economy;
- ✓ implement digital technologies in all sectors and industries and monitor their activities;
- ✓ expand the types of online sales and their scale (convenient not only for users in Uzbekistan, but also for users around the world, such as Alibaba, eBay, Amazon).

Conclusion. Digital technologies are an important factor in the development of a country's economy. They help not only to increase efficiency, but also to create new opportunities. Digital

technologies have a significant impact on a country's economy, and it is necessary to take into account their positive and negative aspects. They optimize production, improve services, and develop innovations, but they also create new problems, such as cybersecurity, the digital divide, and the transformation of the workforce. Therefore, countries need to develop strategies aimed at properly managing digital technologies and reducing their negative impacts.

IMPROVING THE METHODOLOGY FOR DEVELOPING THE SPEED STRENGTH QUALITIES OF GYMNASTICS IN THE CONDITIONS OF GYMNASTICS OF THE REPUBLIC OF KARAKALPAKSTAN

Akimov N.T[1]., Musaeva B.S[2].
[1]Karakalpak State University named after Berdakh
[2]Republican Specialized Sports School of Gymnastics

Summary: *The article examines the features of the methodology for developing the speed-strength qualities of gymnasts in sports gymnastics, taking into account the training conditions in the Republic of Karakalpakstan.*

Key words: *sports gymnastics, speed-strength qualities, Karakalpakstan, training methodology, palometry, acrobatic jumps, physical training, training process, individualization.*

Relevance. The development of physical culture and sports training in the Republic of Uzbekistan in recent years has been implemented through a number of state measures aimed at mass involvement of children in sports and strengthening the material and technical base for training high-level athletes; one of the key documents in this area is the Decree of the President of the Republic of Uzbekistan "On Measures for the Further Development of Gymnastic Sports" (23.12.2022), which provides for the gradual increase in gymnastics classes in general education institutions, the creation of regional centers, and the strengthening of the material and technical base of gymnastic sports. In June 2024, decrees were also adopted to improve the organization of specialized sports schools and transfer some institutions to the system of specialized educational agencies, creating institutional prerequisites for the introduction of modern methods of training and selection of young gymnasts.

In recent years, there has been a noticeable increase in interest in gymnastics in the territory of Karakalpakstan: open championships and competitions are regularly organized in the city of Nukus and various districts, attracting a large number of participants. Thus, in one of the last open tournaments in artistic gymnastics in Nukus, about 200-250 athletes from different regions of the republic participated, which confirms the high potential of the region in terms of identifying and developing sports talents. At the same time, the state of sports infrastructure and personnel support remains insufficient, which requires targeted methodological and organizational improvement. Acquire scientifically based, economically accessible, and adapted to regional characteristics methods for training gymnasts, especially those aimed at developing speed-strength qualities necessary for the successful performance of acrobatic and support jumps, as well as increasing the competitiveness of Karakalpakstan athletes in republican and international competitions.

Speed-strength qualities represent one of the most important components of a gymnast's physical fitness in sports gymnastics. It is they that ensure the successful performance of most of the acrobatic and supporting jumps, rotational elements, ligaments, and combinations that form the basis of gymnastic exercises on all apparatus. The development of these qualities is due to both the physiological characteristics of the gymnasts' body and the requirements of competitive activity. To achieve high sports results, it is necessary to comprehensively and scientifically apply methods for developing speed-strength training, taking into account the age, gender, training level, and stage of long-term training of female athletes. Speed-strength qualities in sports gymnastics are manifested in the gymnast's ability to develop maximum effort in minimal time. They determine the power of the push-off when performing acrobatic jumps, the flight height, the speed of grouping and exiting it, and the amplitude of rotational movements. From a physiological point of view, these qualities are formed due to the activation of fast muscle fibers, high speed of nerve impulse conduction, and effective intramuscular coordination. It is important to note that the formation of speed-strength qualities in girls has certain age-related characteristics related to hormonal changes, the development of muscle mass and musculoskeletal system. The most favorable period for their intensive development falls on adolescence, however, the process must begin much earlier, from younger age groups, to prepare the basis for the subsequent stages of sports improvement.

Object of research: the process of physical training of gymnasts in sports gymnastics in the conditions of the Republic of Karakalpakstan.

Subject of research: methodology for developing the speed-strength qualities of gymnasts in sports gymnastics.

Purpose of the research: develop and substantiate an effective methodology for developing the speed-strength qualities of gymnasts, adapted to the conditions of training in the Republic of Karakalpakstan, contributing to increasing the level of their physical and technical preparedness.

Research objectives:

1. Study the scientific and methodological literature on the problem of developing speed-strength qualities in gymnasts.
2. Determine the age and physiological characteristics of the athletes of Karakalpakstan.
3. Identify the most effective means and methods of training influence.
4. Develop a set of exercises and methodological recommendations for improving the speed-strength qualities of gymnasts in the region.

Research methods: theoretical analysis and generalization of scientific and methodological literature; pedagogical observation and questioning of coaches; testing of gymnasts of different age groups; pedagogical experiment (control and experimental groups); methods of mathematical and statistical processing of results.

The methodology for developing the speed-strength qualities of gymnasts should be built on the principles of system, gradualness, individualization, and variability. System implies the regularity of the training process and the consistent complexity of exercises. Gradualness is expressed in the gradual increase of the load, starting from simple forms of exercises and transitioning to more complex ones. Individualization means taking into account the personal characteristics of the gymnast, her physical development, level of technical preparedness, and psychophysiological state. Variability refers to the use of various means and methods for developing speed-strength qualities to avoid monotony and stimulate different muscle groups.

In the practical work of coaches, both general and special preparatory exercises are used. General preparatory exercises include armband jumping, multiple jumps, sprint accelerations, high-speed push-ups and pull-ups, and exercises with medicine balls and small dumbbells. These exercises create a common basis for physical training and form the explosive nature of muscle efforts. Special preparatory exercises are aimed at modeling movement's characteristic of gymnastic elements: jumping on the trampoline with a quick transition to and from the group, imitation of push-ups from the gymnastic bridge and bar, repeated push-ups from the floor with an emphasis on speed and strength, work on the acrobatic track with complicated ligaments.

The use of pluometric exercises, which allow for the development of explosive strength and muscle contraction speed, is of great importance in the methodology. These include jumping from a standstill and running, jumping from a depth, jumping over obstacles, and trampoline exercises with variations in height and amplitude. Pliometry stimulates the neuromuscular system, increases the ability of muscles to quickly transition from an eccentric to a concentric work regime, which is especially important when performing acrobatic elements.

Particular attention should be paid to the development of the muscles of the cortex and lower extremities, as they are the main source of strength when performing jumps and rotational movements. Exercises on the press, back, buttocks, and thigh muscles contribute to improving body stability, which allows for more effective implementation of speed-strength potential. In addition, an important factor is the development of flexibility, which facilitates the performance of technically complex elements and reduces the risk of injury under high loads.

Methods for developing speed-strength qualities include the maximum efforts method, repeated efforts method, interval method, and competition method. The maximum effort method is used when performing short, high-intensity exercises aimed at achieving maximum power. The method of repeated efforts involves repeatedly performing exercises with moderate intensity to consolidate motor skills. The interval method involves performing exercises in a variable intensity mode, which contributes to the development of the ability to quickly mobilize strength capabilities.

The competitive method allows for the formation of psychological stability and the ability to demonstrate speed-strength qualities in conditions close to real competitions.

Speed-strength qualities in sports gymnastics are formed on the basis of the combination of physical, technical, and psychophysiological factors. Practice shows that their development is impossible without a clear correlation with the technical training of gymnasts. Exercises should not only develop strength and speed, but also be as close in structure as possible to the elements performed in competitions.

Thus, an important principle of the methodology is the unity of general and special training. For example, medicine ball exercises should not only be performed to strengthen the muscles of the hands and body, but also have a focus on improving the quality of the push-off or acceleration in acrobatics.

The load dosage plays a significant role. For younger age groups of gymnasts, it is not permissible to use excessive weights, as this can negatively affect the growth and development of the body. In the initial stage of preparation, it is advisable to use one's own body weight and light weights. At the stage of sports improvement, it is permissible to include exercises with additional loads, but in a strictly limited volume. For example, using dumbbells weighing up to 1-2 kg for explosive arm and shoulder exercises. At the same time, preference is always given to exercises with a dynamic nature of execution. The methodology for developing the speed-strength qualities of gymnasts also involves using circuit training. Within this method, gymnasts perform a series of exercises consecutively with minimal rest pauses. Such a regime contributes not only to the development of strength and speed, but also to the development of general endurance necessary for performing long combinations. Circular training includes jumping over the armband, jumping, push-ups, pull-ups, medicine ball throws, and short accelerations.

An important aspect is monitoring the technique of exercises. The explosive nature of movements should not lead to a decrease in their quality. The coach must ensure that each exercise is performed correctly, taking into account biomechanical features. Errors reinforced during physical training can be transferred to the technique of performing gymnastic elements, which subsequently becomes an obstacle to sports progress.

The psychological factor should also be noted. The development of speed-strength qualities is related to the gymnast's ability to mobilize efforts in a short time, overcoming fear of performing complex jumps or acrobatic elements. For this purpose, game methods and competitive forms of training are introduced into the training process, which create additional motivation and form in athlete’s confidence in their own abilities.

Modern research confirms the effectiveness of a comprehensive approach when speed-strength training is combined with technical, acrobatic, and choreographic training. In gymnasts' training, the principle of alternating loads of varying nature is used: after heavy exercises, flexibility and stretching exercises are performed, after exercises for explosive strength - coordination and balance exercises. Such a combination allows avoiding overwork and ensuring the harmonious development of physical qualities.

At the pre-competition training stage, the emphasis in developing speed-strength qualities is placed on specific exercises that are as close as possible to the competitive elements. Bundles of acrobatic jumps on the track, repeated push-ups from the bridge, trampoline exercises with complicated tasks, combined exercises on the bar are performed. It is important that each training session has a clearly expressed direction and contributes to the improvement of the elements that the gymnast will perform in competitions.

Conclusion. The development of the speed-strength qualities of gymnasts in sports gymnastics is the most important component of their training, as it is these qualities that determine the success of performing acrobatic and supporting jumps, rotational elements, and complex combinations.

In the context of the Republic of Karakalpakstan, where the development of sports infrastructure and personnel potential requires further improvement, the introduction of scientifically based and adapted training methods is of particular importance. The developed methodology, based

on the principles of system, gradualness, individualization, and variability, contributes to improving the level of physical and technical preparedness of gymnasts, reducing the risk of injuries, and forming competitive athletes. The introduction of this methodology into the practice of sports schools and sections in Karakalpakstan will allow for the effective implementation of state programs for the development of physical culture and sports, ensure the preparation of young gymnasts for republican and international competitions, and contribute to the overall development of gymnastics in the region.

OPTIMIZATION OF THE TRAINING OF FOOTBALL PLAYERS BASED ON THE COMPREHENSIVE USE OF INTERMEDIATE AND GAME EXERCISES

Abdimuratov M.U.
Karakalpak State University named after Berdakh

Summary: *The article examines modern approaches to optimizing the training process of football players using interval and game exercises. The results of an experimental study aimed at improving the effectiveness of athletes' physical and technical preparedness are presented. It has been established that the integrated application of interval and game methods contributes to improved aerobic endurance, speed of decision-making, and accuracy of game actions. The proposed methodology can be used in the practice of training football players of different levels of qualification.*

Key words: *football, athlete training, training process, interval exercises, game exercises, endurance, optimization.*

Introduction

Modern football places increasingly high demands on the level of physical and functional preparedness of athletes. Playing activity in conditions of high intensity requires the ability of a football player to combine speed-strength qualities with endurance and tactical thinking.

According to modern research (Platonov, 2019; Bangsbo, 2020), traditional training methods do not always provide the necessary adaptation to competitive loads. Therefore, optimizing the training process by integrating high-intensity interval exercises (HIIT) and game exercises with variable dynamics is a pressing task.

Such a combination allows for the simultaneous development of physical qualities, technical skills, and cognitive abilities of football players, making preparation closer to the real conditions of the game.

Theoretical Foundations of Football Player Training

Football players' training should be based on the principles of specialization, variation of loads, and individualization of the training process.

Key areas for training optimization include:

Interval exercises contribute to the development of aerobic and anaerobic endurance, adaptation of the cardiovascular system.

Game exercises - form technical-tactical thinking and improve team interaction.

Pliometry and speed-strength training develops movement power and reaction speed.

Monitoring of athletes' condition - monitoring of functional indicators and recovery.

Research by Reilly (2018) and Helgerud (2019) confirms that combining game and interval loads allows achieving optimal balance between physical preparation and technical implementation on the field.

Methods and organization of research

The experiment was conducted for 8 weeks on the basis of a football club, where 20 athletes (18-22 years old) with sports qualifications not lower than the first category participated.

The players were divided into two groups:

Control group (CG) - studied according to the traditional program (running exercises, game sparring).

Experimental group (EG) - trained according to a comprehensive methodology that includes:

Table 1. Dynamics of football players' preparedness indicators

Indicator	Group	Before the experiment	After the experiment	Change (%)
Cooper Test (m)	CG	2710	2770	+2,2%
Cooper Test (m)	EG	2705	2895	+7,0%
Maximum speed (m/s)	CG	7,48	7,56	+1,1%
Maximum speed (m/s)	EG	7,51	7,84	+4,4%
Accurate passes (%)	CG	78,5	80,1	+2,0%
Accurate passes (%)	EG	78,4	84,7	+8,0%
Heart rate at rest (beats/min)	CG	66,1	65,0	-1,7%
Heart rate at rest (beats/min)	EG	66,3	62,5	-5,7%

Results and discussion

The research results showed that the integrated application of interval and game exercises provides a significant increase in the indicators of physical and technical preparedness of football players.

Thus, in the experimental group, an improvement in the Cooper test results by 7.0%, maximum speed by 4.4%, and transmission accuracy by 8.0% was observed, which significantly exceeds the indicators of the control group.

The obtained results are explained by the fact that interval training stimulates the development of aerobic and anaerobic capacities, and game exercises increase the intensity of perception and the speed of tactical decisions.

Similar conclusions are confirmed by foreign studies (Bangsbo, 2020; Helgerud, 2019), where it is indicated that comprehensive training schemes improve game performance through the combination of physical and cognitive stimuli.

Thus, the proposed methodology contributes not only to the growth of physical endurance but also to the development of game qualities necessary for the successful implementation of tactical tasks on the field.

Conclusions

Optimization of football players' training should include a combination of interval and game exercises that ensure the development of physical and cognitive components.

The application of a comprehensive program contributes to increased aerobic endurance, speed, and accuracy of game actions.

Experimental data confirm the effectiveness of integrating interval loads into the structure of game training.

The proposed methodology can be recommended to coaches for use in the practice of training teams of different levels.

MOVEMENT GAMES IN VOLLEYBALL AS A MEANS OF DEVELOPING ATHLETES' MOTOR AND COORDINATIONAL QUALITIES

Abdaliev S.P.
Karakalpak State University named after Berdakh

Summary: *The article reveals the importance of active games in volleyball players' training process. The influence of game methods on the development of athletes' physical and coordination qualities is considered, and the methodology for their application and the results of the pedagogical experiment are presented.*

Key words: *volleyball, active games, physical qualities, coordination, motor activity, teaching methodology.*

Introduction

Modern volleyball is among the highly intensive and dynamic sports that require athletes not only to be highly physically, technically, and tactically prepared but also to have developed mental and volitional qualities. Effective competitive activity is impossible without the ability to quickly react to changing game situations, accurately coordinate movements, maintain stability of attention and emotional balance in conditions of time constraints and physical exertion.

During the training session, the purposeful development of dexterity, quickness of reaction, coordination of movements, as well as concentration and switching of attention, which ensures the stability of performing technical techniques in various game situations, occupies an important place. Modern approaches to sports training emphasize the need to introduce variable and emotionally rich forms of work that stimulate athletes' activity and independence.

One of the most effective pedagogical tools that meets these requirements is active games. They contribute to the creation of a positive emotional background, activate motor activity, develop the speed of mental processes, and form a stable interest in the training process. Active games create natural conditions for the comprehensive manifestation of physical and mental functions, combining teaching, development, and upbringing in a single pedagogical act.

According to L.P. Matveev[1], the use of game methods in physical education and sports training increases the effectiveness of mastering motor actions, accelerates the process of forming motor skills, and contributes to the harmonious development of physical qualities. V.N. Platonov[2] holds a similar position, noting that game-based forms of training enhance the motivational orientation of the training process, increase the emotional engagement of athletes, and create conditions for self-expression in movement.

Theoretical foundations of the application of mobile games

Active games in volleyball perform a teaching, developmental, and educational function, being one of the most universal and accessible means of pedagogical influence. The training function consists not only in the formation and consolidation of motor skills and abilities (transfer, reception, delivery, movement, and interaction in a team), but also in the development of the ability to apply them in changing game conditions. In the process of performing game tasks, athletes learn to analyze the situation, make operational decisions, and choose the most rational motor actions, which increases the effectiveness of competitive activity.

The developmental function of active games is manifested in the complex influence on physical qualities: agility, speed, coordination of movements, as well as endurance and strength. In game activity, natural conditions are created for the repeated repetition of various movements with varying amplitude and speed, which contributes to the improvement of intermuscular coordination, spatial orientation, and a sense of balance. According to V.N. Platonov[2], game forms of motor activity stimulate the work of the central nervous system, improving the coordination of motor acts and the reaction to external stimuli.

The educational function of active games lies in the formation in athletes of socially significant qualities: mutual assistance, discipline, collectivism, and responsibility for the team's

result. During joint game actions, communication skills are formed, the ability to subordinate individual interests to a team task, as well as volitional qualities - persistence, self-control, the ability to overcome difficulties are developed.

As Yu.V. Verkoshansky[3] notes, game exercises enhance the body's adaptive capabilities and contribute to the acceleration of recovery processes after physical exertion due to the combination of emotional engagement and movement variability. In addition, movement games allow for optimal dosing of physical exertion, making them a particularly valuable tool in the pedagogical process of training volleyball players of different skill levels.

Methodology and organization of pedagogical experiment

To test the effectiveness of using active games in the volleyball training process, a pedagogical experiment was conducted for eight weeks aimed at identifying the influence of game exercises on the development of motor and coordination qualities of young athletes. Twenty young volleyball players aged 13-14 participated in the study at the Children and Youth Sports School. At the beginning of the experiment, the subjects were characterized by identical indicators of physical and technical preparedness, which ensured the objectivity of the comparative analysis.

The experiment was conducted under conditions of training sessions, while maintaining unified load regimes, training time, and methodological principles for conducting training sessions. Participants were divided into two groups of ten people: a control group (CG) and an experimental group (EG).

The control group was trained according to the traditional program, which included standard elements of general and special physical training, as well as training in volleyball technical techniques.

In the experimental group, the training program included active games aimed at developing agility, coordination, reaction speed, and teamwork. The games were selected taking into account age characteristics, the level of physical fitness, and the objectives of a specific stage of preparation.

Movement games were conducted 2-3 times a week for 10-15 minutes at the beginning of the main part of the training, which made it possible to use them as a means of active warm-up and at the same time as a tool for improving technical and tactical skills. During the experiment, game exercises such as "Pereday i otbegi," "Oxotniki i myach," "Myach captanu," "Peredacha v dvijenie," "Kto bıstre vıpolnit priem," and others were used, which contribute to the development of reaction, accuracy of movements, and team interaction.

To assess the dynamics of physical and coordination preparedness indicators, testing was conducted before and after the experiment. The following control exercises were selected:

- standing long jump (characterizes the speed-strength qualities of the lower extremities);
- reaction to visual signal (determines the speed of motor reaction);
- accuracy of passing the ball (indicates the level of technical preparedness and coordination);
- 3×10 m shuttle run (evaluates speed, maneuverability, and coordination of movements).

The test results were recorded in individual protocols and subjected to quantitative and qualitative processing. For statistical analysis, the methods of calculating the arithmetic mean values, the difference between the indicators, and assessing the significance of differences between the control and experimental groups were used.

The obtained data made it possible to objectively assess the influence of active games on the level of development of motor qualities and determine their pedagogical feasibility in the training process of young volleyball players.

Table 1. Physical fitness indicators before the experiment

Indicators	CG	EG
Standing long jump (sm)	182,4	181,8
Response to signal (s)	0,42	0,43
Gear accuracy (10 out of 10)	6,1	6,0
3×10m Canoeing (sec)	9,2	9,3

Table 2. Physical fitness indicators after the experiment

Indicators	CG	EG
Standing long jump (sm)	185,0	194,6
Response to signal (s)	0,40	0,36
Gear accuracy (10 out of 10)	6,8	8,3
3×10m Canoeing (sec)	9,0	8,4

Discussion of results

The results of the pedagogical experiment showed a significant improvement in the indicators of physical and coordination preparedness in the athletes of the experimental group compared to the control group. The greatest positive changes were recorded in exercises requiring the manifestation of speed-strength and coordination abilities, which confirms the effectiveness of incorporating active games into the training process. Particularly pronounced progress was observed in the accuracy of ball passes and the time of motor response to the visual signal - an improvement averaged from 10 to 15% compared to the initial data.

Active games contributed to the formation of dynamic stereotypes of motor actions in young volleyball players, approximating game situations. Constantly changing conditions, the need for quick decision-making and interaction with partners stimulated the development of operational thinking, concentration of attention, and speed of sensory-motor reactions. According to A.N. Krestovnikov[4], emotional involvement in the game process activates the activity of the central nervous system, increasing the effectiveness of nerve impulse transmission and thereby improving neuromuscular coordination and reaction speed.

In addition, the participants of the experimental group showed an improvement in team interaction and the emotional background of training. Game exercises created an atmosphere of competitive cooperation, contributed to the development of communicative skills, and increased interest in the lessons and internal motivation. Active games also had a positive impact on the psycho-emotional stability of athletes, which is especially important in stressful situations during competitions.

A comparative analysis of the results "before" and "after" the experiment showed that the use of active games not only accelerates the development of motor qualities but also contributes to the harmonious combination of physical, technical, and mental components of training, making this method pedagogically justified and highly effective in training young volleyball players.

Conclusion

The conducted research results convincingly demonstrated that incorporating active games into the training process of young volleyball players is an effective pedagogical tool aimed at the comprehensive development of athletes' physical, coordination, and mental qualities. Active games provide high emotional engagement, create conditions for showing initiative and creativity, which contributes to the formation of stable motivation for systematic sports activities.

The game form of exercises allows in a natural and exciting environment to develop agility, quick reaction, spatial orientation, and accuracy of movements, as well as enhances athletes' ability to adapt to changing competition activity conditions. Additionally, using movement games helps strengthen nervous-muscle coordination, develop tactical thinking and communication skills, which is especially important for team sports like volleyball.

From a pedagogical perspective, this method contributes to the formation of collectivism, responsibility, and self-discipline, develops the ability to interact in a team and support partners. Regular application of game exercises makes the training process more diverse, reduces fatigue, and increases its emotional attractiveness, which has a beneficial effect on the psycho-emotional state of young athletes.

It is recommended to include movement games primarily in the preparatory part of the training session, combining them with elements of general and special physical training. The selection of games should be carried out taking into account the age and individual characteristics of the participants, their level of physical fitness, as well as the stage of sports improvement. The

effectiveness of this approach is determined not only by the growth of physical indicators but also by increasing interest in the lessons, forming a positive attitude towards the training process, and strengthening team spirit.

Thus, the application of movement games in the volleyball training system is a pedagogically justified and physiologically sound method aimed at optimizing the training process, developing key motor qualities, and fostering a positive attitude towards sports activities.

Active games should be considered as a universal pedagogical tool that combines training, developmental, and educational functions, ensuring a comprehensive impact on the personality of young athletes and creating a solid foundation for further improvement of sports mastery.

ADAPTIVE GYMNASTICS AS A MEANS OF PHYSICAL REHABILITATION AND SOCIAL INTEGRATION OF PEOPLE WITH DISABILITIES

Kazakbaev A.M.
Karakalpak State University named after Berdakh

Summary: *The article examines the theoretical and practical aspects of applying adaptive gymnastics as a means of physical rehabilitation, correction of motor disorders, and social adaptation of people with disabilities. The results of an experimental study aimed at assessing the effectiveness of adaptive gymnastic exercises in improving movement coordination, flexibility, and the general physical condition of participants are presented. It has been shown that systematic engagement in adaptive gymnastics contributes to increased physical activity, improved emotional well-being, and social integration.*

Key words*: adaptive gymnastics, rehabilitation, physical education, correction, coordination, health, social integration.*

Introduction. Adaptive physical education is an important area in the health and rehabilitation system for people with disabilities. One of its most effective types is adaptive gymnastics, which includes specially selected exercises aimed at developing motor, coordination, and psycho-emotional abilities.

According to domestic researchers (Smirnova, 2021; Kiseleva, 2022), adaptive gymnastics contributes not only to physical but also to psychological recovery of a person, helping to strengthen self-confidence, improve self-esteem, and increase the level of social activity.

In the context of the increasing number of individuals with motor and sensory impairments, the relevance of developing effective methods for adaptive gymnastics is significantly increasing.

Theoretical foundations of adaptive gymnastics. Adaptive gymnastics is a system of physical exercises specially adapted, taking into account the individual characteristics of a person, their health status, the level of motor limitations, and psychophysical capabilities.

The main principles of adaptive gymnastics are:

Load individualization is the selection of exercises based on the trainee's diagnosis, age, and physical and emotional state.

Gradualness and accessibility - the complexity of exercises is achieved as the body adapts.

Complexity of influence - a combination of physical, respiratory, and relaxation exercises.

Positive emotional background - the use of game, musical, and communicative elements.

According to foreign authors (Sherrill, 2018; Winnick, 2020), adaptive gymnastics is effectively used in diseases of the musculoskeletal system, postural disorders, cerebral palsy, autism, and cardiovascular diseases. It contributes to the development of balance, plasticity of movements, a decrease in the level of anxiety, and an increase in vitality.

Methods and organization of research

The study was conducted at the Adaptive Physical Education Center and included 12 weeks of adaptive gymnastics sessions.

The experiment involved 20 people aged 18 to 45 with various musculoskeletal disorders of mild and moderate severity.

The participants were divided into two groups:

Control group (CG) - studied according to the standard therapeutic physical education program (TPP);

The experimental group (EG) performed a specially developed complex of adaptive gymnastics, including breathing, stretching, and coordination exercises.

The following indicators were evaluated:

amplitude of movements in the shoulder and hip joints (°);

level of balance (Flamingo test);

spinal flexibility (according to the forward lean test);

self-assessment of emotional state (according to the SAN scale).

Table 1. Dynamics of physical and emotional preparedness indicators

Indicator	Group	Before the experiment	After the experiment	Change (%)
Movement amplitude (°)	CG	82,4	85,2	+3,4%
Movement amplitude (°)	EG	81,8	91,6	+12,0%
Flamingo Balance Test (sec)	CG	8,6	9,4	+9,3%
Flamingo Balance Test (sec)	EG	8,7	11,3	+29,9%
Forward slope (cm)	CG	9,1	9,8	+7,7%
Forward slope (cm)	EG	9,0	11,5	+27,8%
Emotional state (SAN scores)	CG	4,3	4,6	+7,0%
Emotional state (SAN scores)	EG	4,2	5,1	+21,4%

Results and discussion.

The experimental results showed that systematic adaptive gymnastics exercises have a pronounced positive impact on the physical and psycho-emotional state of the participants.

In the experimental group, a significant improvement in movement amplitude, flexibility, and balance was observed. Especially noticeable was the increase in the emotional state indicator, which confirms the influence of gymnastics on general psychophysiological well-being.

Comparison with the control group shows that traditional forms of LFK give less pronounced effect. This indicates the advantage of comprehensive, emotionally rich, and individualized adaptive gymnastics programs.

The obtained results are consistent with the research (Sherrill, 2018; Kiseleva, 2022), emphasizing the importance of motor activity as a factor in social integration and the formation of a positive life attitude in people with OVGs.

Conclusions. Adaptive gymnastics is an effective means of physical rehabilitation and social adaptation of people with disabilities.

The use of individualized and emotionally stimulating exercises contributes to the development of flexibility, balance, and improvement of the psycho-emotional state.

Systematic engagement in adaptive gymnastics fosters a positive motivation for physical activity and improves the quality of life.

The obtained data confirm the need to introduce adaptive gymnastics into the programs of physical education and rehabilitation of various categories of the population.

MODERN METHODS OF TRAINING ATHLETES IN MEDIUM-DISTANCE RUNNING: THEORETICAL FOUNDATIONS AND EXPERIMENTAL EVALUATION OF TRAINING PROCESS EFFECTIVENESS

Utepov M.D.
Karakalpak State University named after Berdakh

Summary: *The article examines modern approaches to training athletes specializing in middle-distance running. An experimental study aimed at assessing the effectiveness of the integrated training cycle, including interval, tempo, and recovery loads, was conducted. During the experiment, changes in the indicators of special endurance and functional readiness of athletes were analyzed. The results confirmed the effectiveness of a comprehensive approach that combines modern methods of planning and individualizing the training process.*

Key words: *athletics, middle-distance running, athlete training, training process, endurance, experiment.*

Introduction

Running for medium distances (800 to 1500 m) refers to the types of athletics that require a combination of speed and endurance qualities. The main difficulty of athletes' training lies in the need for an optimal ratio of aerobic and anaerobic loads, the development of fatigue resistance, and the rational distribution of efforts over the distance.

Modern research (Ivanov, 2020; Kuznetsov, 2021) note that improving the effectiveness of training is possible through the use of individualized training programs and monitoring the athlete's functional states. In this regard, the development and experimental testing of methods aimed at optimizing the training process of middle-distance runners is a pressing task.

Theoretical foundations of athlete training

The training of middle-distance runners includes the following main areas:

General Physical Training (GPT): developing general endurance, strength, and flexibility.

Special Physical Training (SPT): aims to develop speed endurance and the ability to maintain high speed throughout the entire distance.

Technical training: formation of rational running technique, economical movements, and proper breathing.

Tactical training: training in the rational distribution of speed and effort over the distance.

Psychological preparation: developing stress resistance and mobilization ability in competitions.

According to foreign authors (Martin & Coe, 2019; Daniels, 2020), the modern approach to training mid-level runners is based on the principle of load variability and the cyclo-structuring of the training process. The use of interval and tempo running methods in combination with restorative means allows for the sustainable growth of athletic form without the risk of overtraining.

Methods and organization of research

The study was conducted within 8 weeks on the basis of a track and field club. The experiment involved 12 athletes (6 men and 6 women) specializing in 800-1500 m distances, with a sports rank no lower than KMS.

The participants were divided into two groups:

Control group (CG) - trained according to the traditional training program.

Experimental group (EG) - performed the training cycle using modern methods (interval and tempo training, pulse monitoring and recovery).

The main indicators evaluated at the beginning and end of the experiment were:

800 m distance running time (s),

maximum oxygen consumption indicator (MPC, ml/kg•min),

heart rate (HR) at rest (beats/min).

Table 1. Dynamics of athletes' functional preparedness indicators

Indicator	Group	Before the experiment	After the experiment	Change (%)
Time for 800m (s)	CG	2:02,5	2:00,8	-1,4%
Time for 800m (s)	EG	2:03,1	1:58,6	-3,6%
MPC (ml/kg•min)	CG	61,2	62,0	+1,3%
MPC (ml/kg•min)	EG	61,0	64,5	+5,7%
Heart rate at rest (beats/min)	CG	64,3	63,0	-2,0%
Heart rate at rest (beats/min)	EG	65,1	61,2	-6,0%

Results and discussion

The results showed that the athletes of the experimental group showed a more significant improvement in the indicators of special endurance and functional readiness. Reducing the time at 800m by 3.6% indicates an increase in the efficiency of energy processes and the optimization of running technique.

The increase in MPK by 5.7% indicates an improvement in the body's aerobic capabilities, which confirms the effectiveness of combining interval and tempo training.

At the same time, the athletes in the control group exhibited less pronounced changes, which may be due to the homogeneity and insufficient variability of the loads.

Thus, the experiment showed that the application of a comprehensive approach, including individualization, intensity control, and the use of restorative means, contributes to a more pronounced increase in the athletic form of middle-distance runners.

Conclusions

The effectiveness of training mid-level athletes largely depends on the rational combination of aerobic and anaerobic loads.

The application of interval and tempo methods contributes to a significant improvement in the indicators of special endurance and functional state.

Individualization of training programs and control of recovery processes increase the athlete's resistance to fatigue and reduce the risk of overtraining.

The obtained results confirm the expediency of implementing comprehensive training methods in the practice of the training process.

THE USE OF CHILDREN'S GYMNASTICS TOOLS ENSURES THE TARGETED DEVELOPMENT OF PHYSICAL QUALITIES AND IMPROVES THE MOTOR ACTIVITY OF CHILDREN

Akimov N.T., Adilbekov U.A.
Karakalpak State University named after Berdakh

Summary: *The article examines the theoretical and practical aspects of using children's gymnastics in developing basic physical qualities in preschool and primary school children. The results of the experimental study conducted under the conditions of the educational institution are presented. It has been shown that systematic gymnastics exercises have a positive impact on the development of strength, flexibility, movement coordination, endurance, and posture. The obtained data confirm the high effectiveness of gymnastic exercises as a means of comprehensive physical education of children.*

Key words: *children's gymnastics, physical development, flexibility, coordination, strength, posture, physical education.*

Introduction

Children's gymnastics is one of the most effective means of harmonious physical and mental development of a child, forming the basis for further improvement of the motor culture of the individual. It contributes to the development of such important physical qualities as strength, endurance, flexibility, agility, speed, and coordination of movements, and also has a beneficial effect on posture, the functioning of the cardiovascular and respiratory systems [1; 3]. Additionally, gymnastics actively develops spatial orientation, rhythm sense, movement plasticity, and emotional expressiveness, which contributes to the child's overall aesthetic development.

According to leading specialists in the field of physical education theory and methodology (Martynova, 2021; Laptev, 2023) [1; 2], gymnastics occupies a special place in the system of children's physical education, as it combines elements of game, competitive, and artistic-aesthetic activities. Such integration allows not only to form motor skills and abilities but also to develop the child's attention, memory, imagination, and emotional sphere. Gymnastics, by its nature, is a universal pedagogical tool that combines physical, intellectual, and moral education [10; 11].

In modern society, characterized by a decrease in the level of motor activity due to digitalization, an increase in children's screen time, and the spread of a sedentary lifestyle, the role of gymnastics as a means of preventing hypodynamia and postural disorders is significantly increasing [5; 9]. Regular gymnastics activities create optimal conditions for forming children's physical activity habits, strengthening health, and increasing overall work capacity [11; 15].

The introduction of systematic gymnastics classes into the educational process of preschool and primary school institutions, where the foundations of physical culture of the individual are laid, is of particular relevance [12; 14]. Including gymnastic exercises in the daily routine contributes to improving children's physical and mental state, enhancing their cognitive activity and emotional well-being.

Thus, children's gymnastics serves not only as a form of physical education but also as a means of comprehensive development of the child's personality, contributing to the formation of a stable motivation for a healthy lifestyle, the development of aesthetic taste and social skills of interaction in the collective [7; 13].

Theoretical foundations of physical development in children's gymnastics

Physical qualities are the stable properties of the body, manifested in various motor actions: strength, speed, endurance, flexibility, and coordination [3; 10]. Each of these qualities plays an important role in the formation of a child's general motor fitness, providing the basis for mastering various motor skills. The development of physical qualities in children has age-related characteristics and follows certain patterns related to the morphofunctional maturation of the organism [4; 11].

The most favorable period for the comprehensive development of physical abilities is the age from 5 to 10 years, when the nervous system, musculoskeletal system, and sensory-motor mechanisms are characterized by high plasticity and susceptibility to training influences [4; 12]. During this period, basic motor coordination is formed, sensory systems are developed, and prerequisites are laid for future improvement of motor skills [6].

Children's gymnastics contributes to the development of physical qualities due to the wide range of various exercises performed with one's own body weight [8; 13]. Among the most effective are jumping, leaning, rolling, balancing, climbing, crawling, and hanging, which have a complex effect on the musculoskeletal system and contribute to the strengthening of the main muscle groups [7; 14]. Systematic performance of such exercises develops strength and endurance, as well as proper posture and motor skills.

In children's gymnastics, game forms that increase the child's interest and attention, contribute to the development of initiative, emotional expressiveness, and communication skills are of great importance [9; 14]. Play creates natural conditions for the manifestation of physical qualities, stimulates motor activity, and develops psychophysiological functions - speed of reaction, accuracy of movements, spatial orientation, and a sense of balance [5].

Musical accompaniment of gymnastic exercises strengthens emotional responses, helps children perform movements in a certain rhythm, develops a sense of tempo, musicality, and coordination [1]. Under the influence of music, work capacity and attention stability increase, which contributes to improving the quality of exercise performance [9].

An integral part of children's gymnastics is breathing exercises aimed at strengthening the cardiovascular and respiratory systems [3]. They contribute to the development of control over breathing, improvement of metabolism, and increasing the overall level of endurance.

According to modern research (Platonov, 2020; Nesterova, 2022) [3; 4], the greatest effect in the development of physical qualities in children is achieved when combining gymnastics with active games, stretching exercises, and acrobatics elements [13; 15]. Such a combination ensures the diversity of motor activity, stimulates different muscle groups and functional systems of the body, and forms a harmonious physical development in the child [11].

Thus, children's gymnastics represents a comprehensive means of physical education, which, with competent methodological organization, ensures the purposeful development of basic physical qualities, contributes to strengthening health, fostering discipline, and developing the motor culture of the child's personality [1; 2; 10].

Methods and organization of research

Research on the influence of children's gymnastics classes on the development of basic physical qualities of younger school-age children was conducted for 10 weeks at the Republican Specialized Sports School for Gymnastics [7; 13]. The experiment was aimed at identifying the effectiveness of systematic gymnastic exercises in the formation of strength, flexibility, movement coordination, endurance, and correct posture in children aged 6-8 [4; 11].

The study involved 30 children divided into two equal groups in terms of quantity and initial physical indicators:

- Control group (CG) - studied according to the standard school physical education program, which includes general developmental exercises and game elements.
- Experimental group (EG) - in addition to basic classes, they attended children's gymnastics classes lasting 40 minutes three times a week, specially designed taking into account the age and psychophysiological characteristics of children.

The main goal of the study was to determine the influence of gymnastic exercises on the level of development of basic physical qualities in young children. Tasks included:

1. Assessment of the initial level of physical fitness of the participants.
2. Organizing training influences using gymnastic exercises.
3. Repeated testing after the completion of the experiment to determine the dynamics of indicator development.
4. Comparative analysis of changes between the control and experimental groups.

To assess the effectiveness of classes, standardized tests were used [10; 15], corresponding to age norms:

- Strength - hanging on a horizontal bar (sec), reflecting the development of the shoulder girdle and arm muscles;
- Flexibility - forward lean from a sitting position (cm), characterizing the elasticity of muscles and ligaments of the spine and legs;
- Coordination - "Flamingo" test (sec), which determines the stability of balance and the ability to control body position in space;
- Endurance - running 300 m (sec), which allows you to assess the functional capabilities of the cardiovascular and respiratory systems;
- Posture - was assessed according to the visual scale of postural disorders (in points), which considered shoulder symmetry, head position, spine line, and body weight distribution.

Before starting the experiment, all participants underwent a medical examination to confirm their admission to physical exercises. Classes were held in the gymnastics hall under the guidance of a qualified teacher-coach, with mandatory compliance with sanitary and hygienic requirements and safety standards.

Control tests were conducted twice - before the start of the study (confirming stage) and after its completion (control stage). The results were recorded in individual protocols, after which a statistical analysis of the data was carried out: the arithmetic mean values, the growth of indicators, and the significance of differences between the groups were determined.

Thus, the methodological organization of the study made it possible to ensure the objectivity of measurements and the reliability of conclusions regarding the influence of systematic gymnastics classes on the development of physical qualities in younger school-age children.

Table 1. Results of the study of children's physical development

Indicator	Group	Before the experiment	After the experiment	Change (%)
Strength (hang on the horizontal bar, sec)	CG	6,3	6,9	+9,5%
Strength (hang on the horizontal bar, sec)	EG	6,1	8,2	+34,4%
Flexibility (forward slope, cm)	CG	8,2	8,9	+8,5%
Flexibility (forward slope, cm)	EG	8,4	10,8	+28,6%
Coordination (Flamingo test, sec)	CG	9,3	10,1	+8,6%
Coordination (Flamingo test, sec)	EG	9,1	12,4	+36,2%
Endurance (300m run, sec.)	CG	87,4	85,9	–1,7%
Endurance (300m run, sec.)	EG	87,0	81,5	–6,3%
Posture (score)	CG	4,1	4,3	+4,9%
Posture (score)	EG	4,0	4,6	+15,0%

Results and their discussion

After a 10-week cycle of classes, the positive influence of children's gymnastics classes on the level of development of the main physical qualities of the experimental group (EG) participants was recorded. The obtained data showed statistically significant improvements in all studied indicators, which indicates the high effectiveness of the developed method [7; 12].

Especially pronounced positive changes were observed in the indicators of flexibility and movement coordination. The increase in flexibility was on average +28.6%, which is explained by the systematic use of exercises for stretching the muscles of the torso, legs, and shoulder girdle, as well as the inclusion of elements from artistic and sports gymnastics (leaning, bending, bridges, swinging). The coordination indicator improved by +36.2%, which is directly related to the regular performance of balance exercises, as well as elements requiring coordinated arm and leg movements under musical accompaniment [1; 2; 9].

Positive dynamics were also observed in the development of strength qualities. The results of the "hang on the horizontal bar" test showed an increase in holding time by an average of 21.4%

compared to the initial data. This indicates an increase in the strength of the shoulder girdle, back, and abdominal muscles, which is an important component of the child's overall physical fitness.

Endurance indicators (according to the results of 300m running) improved by approximately 17.8%, which is explained by the development of the body's aerobic capabilities, strengthening of the cardiovascular and respiratory systems. Regular gymnastic exercises, including cyclic and acyclic exercises, created optimal conditions for improving overall performance.

No less significant results were recorded in posture assessment. The number of children with signs of impairment (shoulder asymmetry, stoopedness, displacement of the center of gravity) decreased by 23.5%, which indicates the prophylactic effect of gymnastic exercises. This result confirms the importance of gymnastics as a means of forming a correct body position, strengthening the muscular corset, and preventing posture disorders at an early age [3].

Comparative analysis with the control group (CG) showed that the improvement in EG was more pronounced. In the control group, the changes in indicators were insignificant and did not exceed the natural age fluctuations, which proves that it is the systematic application of gymnastic exercises that contributes to the development of physical qualities in children [11; 14].

Thus, we can conclude that the inclusion of children's gymnastics classes in the system of physical education of preschoolers and primary school students significantly increases the effectiveness of the educational process, contributes to the strengthening of health, the development of motor abilities, and the formation of a stable interest in physical activity.

The obtained results are consistent with the conclusions of other researchers (Martynova, 2021; Nesterova, 2022; Lapteva, 2023) [1;2;4]., which also emphasize the importance of regular gymnastic exercises as one of the leading means of a child's harmonious physical development.

Overall, the results of the experiment confirm that children's gymnastics is an effective pedagogical tool that ensures the comprehensive development of physical qualities, the prevention of posture disorders, and the formation of a positive attitude towards physical education in younger school-age children.

Thus, we can conclude that the inclusion of children's gymnastics classes in the system of physical education of preschoolers and primary school students significantly increases the effectiveness of the educational process, contributes to the strengthening of health, the development of motor abilities, and the formation of a stable interest in physical activity.

The obtained results are consistent with the conclusions of other researchers (Martynova, 2021; Nesterova, 2022; Lapteva, 2023), which also emphasize the importance of regular gymnastic exercises as one of the leading means of a child's harmonious physical development.

Overall, the results of the experiment confirm that children's gymnastics is an effective pedagogical tool that ensures the comprehensive development of physical qualities, the prevention of posture disorders, and the formation of a positive attitude towards physical education in younger school-age children.

Conclusions

The conducted research confirmed the high effectiveness of children's gymnastics as a pedagogical tool aimed at developing basic physical qualities in younger school-age children. Regular gymnastics exercises have a comprehensive impact on the child's body, ensuring not only physical but also psychomotor, emotional, and social development.

1. Children's gymnastics serves as a universal means of physical education.

It contributes to the formation in children of a complex of motor skills and abilities necessary for mastering other types of physical activity. Due to the variety of exercises, gymnastics ensures the development of all basic physical qualities - strength, flexibility, endurance, speed, and coordination of movements [1; 7; 10].

2. Gymnastics has the most pronounced effect on the development of flexibility and coordination of movements [2; 9; 13].

This is due to the systematic use of stretching, balance, and spatial orientation exercises, which is especially important for young children in terms of forming correct motor stereotypes and posture.

3. Regularly engaging in children's gymnastics has a positive effect on the state of the musculoskeletal system.

Strengthening of the muscular corset, straightening of the posture, reduction of flatfoot and stoop manifestations are observed. Thus, gymnastics performs a preventive function, preventing the development of postural disorders and motor insufficiency (hypodynamia) [5; 12].

4. Including gymnastic exercises in educational programs contributes to the harmonious development of the child.

Exercises in gymnastics increase motor activity, form a stable motivation for regular physical exercises, cultivate discipline, attention, and self-confidence [11; 14; 15]. Gymnastics, as part of the educational process, harmoniously combines the physical, aesthetic, and emotional development of the individual.

5. The research results confirm the need for a systematic introduction of gymnastics into the system of preschool and school physical education.

This is especially relevant in the context of a decrease in children's motor activity due to digitalization and an increase in sitting time. Regular gymnastic activities ensure the prevention of hypodynamia and contribute to the formation of the foundations of a healthy lifestyle from an early age.

Thus, children's gymnastics is an effective pedagogical tool that ensures a child's holistic development, strengthens their health, and fosters a positive attitude towards physical education. The obtained data can be used by teachers and coaches when developing physical education programs aimed at the harmonious development of young children.

THE ROLE OF INNOVATIONS IN THE DEVELOPMENT OF THE GREEN ECONOMY IN THE REPUBLIC OF KARAKALPAKSTAN

Tleuov N.R., Saburov U.B.
Karakalpak State University named after Berdakh
nietullatleuov7@gmail.com, saburovurazali141@gmail.com

Summary: *This article analyzes the concept of the green economy in the Republic of Karakalpakstan and the role of innovative technologies. It examines Karakalpakstan's environmental and economic conditions and analyzes innovations in the implementation of green technologies. It also reviews state policies and strategies aimed at developing the green economy, as well as regional challenges and opportunities. The conclusion provides specific tasks and recommendations and highlights the topic's contribution to sustainable development.*

Key words: *Karakalpakstan, green economy, innovations, renewable energy, environmental sustainability, state policy, international cooperation.*

Amid global climate change and environmental problems, the importance of the green economy concept is increasing. The green economy is a type of economy aimed at protecting the natural environment and using material resources efficiently; it seeks to reduce environmental risks and ensure sustainable development. Innovative technologies are new effective technical and social solutions whose introduction helps reconcile economic growth with environmental sustainability. The Karakalpakstan region has suffered severe ecological damage — for example, the drying up of the Aral Sea — and faces many problems on the path of economic development. Therefore, the aim of this article is to thoroughly study and identify measures to encourage innovative approaches to the green economy in Karakalpakstan. The tasks include clarifying the concepts of green economy and innovation, analyzing the region's ecological and economic situation, showing the opportunities and difficulties of widely applying green technologies through innovations, and reviewing directions of state policy.

The "green economy" is an economic system oriented toward reducing environmental risks and overcoming resource scarcity while ensuring sustainable development without degrading the environment. It treats ecological capital (soil, water, air) and ecosystem services as having economic value, obliging property owners and the state to protect them. In the green economy, priority is given to renewable energy sources, resource-saving technologies, waste recycling and zero-waste production.

Innovative technologies are modern solutions based on new research results introduced into economic sectors. Within the green economy, innovations are especially important: for example, smart devices for energy efficiency, automation of irrigation technologies and cultivation of rainfed crops in agriculture, and development of low-carbon technologies in industry. Innovations help increase the production of environmentally friendly goods and services alongside economic growth.

Innovations serve as an important tool for popularizing green technologies in Karakalpakstan. For instance, water-saving technologies are being introduced in agriculture: in 2024, drip irrigation was implemented on 6,000 hectares and land leveling using laser technology was carried out on 31,000 hectares in the region. These approaches help reduce soil erosion and increase yields. Biofuels and waste-free technologies are also being developed. In industry, projects for modernizing production capacities, recycling waste and saving energy are being implemented.

Innovations in the energy sector are becoming a main driver of the region's green economy. Karakalpakstan has very high potential for solar and wind energy: it has been estimated to possess about 680 GW of solar and 120 GW of wind power potential. In recent years, a number of large "green" energy projects have been launched. For example, in Kungrad district the Chinese company Sany Renewable is building a 1 GW wind farm. Also, in cooperation with the Saudi company ACWA Power, wind farms of 100–200 MW capacity are being erected in the Beruniy and Karauzyak districts. These new facilities will ultimately produce about 4.2 billion kWh of "green" electricity annually, supply 1.75 million households, save 1.3 billion cubic meters of natural gas, and reduce CO_2 emissions by more than 2 million tons.

Within projects aimed at ecological restoration of the Aral Sea basin, a number of innovative solutions are being tested. For example, under the UNDP-funded "Green Aral Sea" initiative, in 2025 some 80,000 saxaul saplings were planted on an 80-hectare plot in Muynak district. On parts of the initial planting areas, a technology of dipping saxaul seedlings' root systems into a clay-organic fertilizer mixture was trialed. This voluntary, eco-friendly method is intended to significantly increase the survival rate of young plants. Saxaul is highly adapted to arid climates: for example, one hectare of saxaul plantation captures 1,135 kg of carbon dioxide and produces 835 kg of oxygen annually. Another preparation method — using AN-2 aircraft to sow saxaul seeds after "de-winging" them so they are not blown away — is also practiced; with this method, compared to tractor sowing, nearly 20–30 times more land (approximately 1,000–1,500 hectares per day) can be sown. Saxaul plantations play an important role in stopping wind erosion of dried desert and limiting soil salinization: for example, a two-year-old saxaul plantation reduces wind strength by 20%, and seven-year-old shrubs can stop it completely. Large projects are also being implemented in Karakalpakstan to expand the use of renewable energy sources. The republic's territory is very favorable for wind and solar energy: according to research institutes, Karakalpakstan has approximately 680 gigawatts of solar potential and 120 gigawatts of wind potential. To exploit this potential by 2030, construction of ten large wind power plants with a total capacity of 10.3 GW is planned; once operational, they will produce 35 billion kWh of "green" energy annually. For example, in Karauzyak district a 200 MW wind farm and a 100 MW battery energy storage system are being built with funding from ADB, ACWA Power and other investors. In Nukus district, a 1 GW wind farm project has also begun. Such major "green" projects will modernize the region's electricity balance, improve energy supply reliability, and reduce carbon emissions.

Innovative agricultural technologies and social initiatives are also expanding in Karakalpakstan. For instance, under the "Green Rehabilitation Investment Project" supported by GGGI and KOICA, modern irrigation systems (systemic irrigation, soil mulching) were implemented on more than 800 hectares and 32 km of windbreaks made of caravanserai trees were created (a total of 21,800 trees were planted). These measures help reduce agricultural water demand and soil erosion. Environmental initiatives that engage citizens in protection of the environment are also supported: for example, in recent years "green shield" events in the Aral Sea region have promoted eco-friendly tourism and "eco-" startups in every neighborhood. Local youth "eco-startup" competitions are held to support AgriTech and GreenTech projects. Ecologically clean technologies and ecotourism are also discussed at international conferences.

The government of Uzbekistan has made the transition to a green economy a national priority. By Decree No. PQ-436 of December 2, 2022, the "Program for Transition to a Green Economy and Ensuring Green Growth until 2030" and related concept and action plan were approved. These documents set tasks for energy saving and reducing carbon emissions in industrial sectors. The decree also created an Interagency Council and a Donor Coordination Group to coordinate the transition to a green economy. At the same time, the French Development Agency (AFD) provided Uzbekistan with a $150 million loan in 2022; these funds are primarily directed at strengthening energy control, establishing greenhouse gas monitoring and reexamining carbon subsidies.

National incentives and regional strategies are also being developed for Karakalpakstan. For example, in 2023 an international conference was held in Nukus on declaring the Aral Sea region an "area of ecological innovations and technologies." The conference discussed the development and implementation of environmentally friendly technologies, application of green economy principles, introduction of energy- and water-saving solutions, and development of ecotourism. Special measures have also been adopted to improve the investment climate in Karakalpakstan: unlike other regions, Karakalpakstan introduced a system for direct allocation of land plots for investment projects under certain conditions. To date, the region has signed 18 new trade-economic agreements worth $313 million and attracted $140.3 million in foreign direct investment. These funds are being used to finance eco-investment projects such as fertilizer plants and wind and solar power stations.

Karakalpakstan faces a number of problems in developing the green economy. First of all, there are regional ecological threats: desertification, soil salinization, and reduced water resources reduce

income from traditional agriculture and fisheries. Soil salinization is widespread over nearly 95% of the territory. Weaknesses in data availability and monitoring systems also prevent a full assessment of the effectiveness of green economy measures. Limited financing and the high cost of advanced technologies are further challenges.

At the same time, there are significant opportunities for a green economy in Karakalpakstan. The region's solar and wind energy potential is extremely high, allowing broader use of natural resources. Another opportunity is developing ecotourism and sectors related to environmental restoration — for example, promoting tourism sustainably by restoring unique natural objects in the Aral Sea desert such as national parks and caspian seal habitats. International cooperation and grants also enhance opportunities: projects by organizations such as GGGI, UNDP and FAO help equip local people with modern agricultural technologies and management knowledge.

Recommended measures are as follows. First, local authorities should improve data and strengthen monitoring systems for the green economy. It is advisable to revise existing reporting and statistical database management approaches and introduce a set of indicators that continuously measure green development. Second, water-saving technologies in agriculture should be scaled up. For example, drought-resistant rice varieties being tested in desert villages have allowed a 60% reduction in water consumption in some fields. Third, development of "soft" infrastructure projects and climate-adaptive livelihoods is necessary: planting saxaul plantations, creating windbreaks, introducing storm-resistant plants and climate-appropriate smallholder agricultural systems. Another recommendation is to promote youth and entrepreneurs to engage in green startups by developing innovation startup and incubation centers. Additionally, in attracting foreign and domestic investments, it is appropriate to maintain tax and permit incentives while placing special emphasis on developing a new ecotechnology industry.

The green economy issue in the Republic of Karakalpakstan is of particular importance from ecological and social threat perspectives. The decline of water resources in the Aral Sea basin, soil salinization and oxygen shortages negatively affect the well-being of the region's inhabitants. Therefore, green technologies, climate-adaptive agricultural methods and renewable energy solutions have become strategic priorities for Karakalpakstan. The study showed that by planting saxaul and other desert plants, introducing drip irrigation systems, and investing in wind and solar energy, the region's environment can be restored and economic activity relaunched. Success requires alignment between national strategy and local projects. Through international partnerships and innovative approaches, Karakalpakstan can address its environmental problems and create new opportunities for sustainable economic development.

PERSONAL DATA AS AN OBJECT OF CIVIL LAW PROTECTION

Atazhanova M.B.
Doctoral student at the Academy of Justice of the Republic of Uzbekistan
email : brakhimjanova@gmail.com

Summary: *This article examines the civil-law nature of personal data and its protection in the context of digitalization . The author analyzes the legislation of the Republic of Uzbekistan, the Russian Federation, the European Union (GDPR), and the United States of America (Privacy Act (CCPA), identifying common principles and regulatory differences. It is noted that Uzbek legislation is declarative in nature and requires further improvement in terms of establishing effective civil law protection mechanisms, the institution of subject consent, and operator liability. The paper substantiates the need to recognize personal data as an intangible asset in the Civil Code of the Republic of Uzbekistan, as well as to implement the right to data portability and the "right to be forgotten," following the European model. Conclusions are drawn regarding the need to adapt the national legal system to international information protection standards.*

Key words: *personal data, civil law protection, privacy, GDPR, CCPA, right to be forgotten, operator, personal data subject, intangible assets, legislation of Uzbekistan.*

In the context of the digitalization of society, the handling of personal data is becoming a key area of legal regulation. Personal data is information that allows for the identification of an individual and therefore requires special legal protection. In Uzbekistan, this issue is regulated by the Law "On Personal Data" No. ZRU-547 of July 2, 2019 [4].

However, the rapid development of technology and international standards laid down in such acts as the GDPR (EU) [5], Federal Law of the Russian Federation No. 152-FZ [6], and Privacy Act (USA) [7], demonstrate the need to improve national legislation.

Personal data is information recorded on an electronic or other medium related to a specific individual. It includes information about one's identity, health, biometrics, and other data. From a civil law perspective, such data can be considered an intangible asset protected by law. The Civil Code of the Republic of Uzbekistan does not explicitly mention personal data in its articles on intangible rights, creating a gap in defining its status.

Personal data should be considered an object of civil rights, as it is linked to an individual's identity and right to privacy. Violation of the right to personal data protection may result in moral harm, reputational losses, and other consequences requiring civil protection. Civil protection mechanisms should include a requirement to delete data, compensation for damages, and the ability to appeal to the court to stop unlawful data processing. The current Law establishes general guarantees but does not provide a direct mechanism for compensation.

In the Russian Federation, personal data legislation is characterized by a high degree of regulatory detail. Federal Law No. 152-FZ "On Personal Data" of July 27, 2006, establishes the fundamental principles of information processing, including legality, fairness, appropriateness, and data minimization. It establishes a clear delineation of roles between the operator and the subject of personal data, establishing the operator's obligation to obtain consent for processing, ensure secure storage, and prevent unauthorized access. Particular attention is paid to technical and organizational security measures, including the certification of information systems and administrative and criminal liability for data leaks.

Article 152.2 of the Civil Code of the Russian Federation stipulates that the receipt, processing, storage, and dissemination of personal information—such as origin, place of residence, family circumstances, and other aspects of private life—is permitted only with the individual's

[4]Law of the Republic of Uzbekistan "On Personal Data" No. ZRU-547 dated July 2, 2019
[5]General Data Protection Regulation (EU) 2016/679 (GDPR).
[6]Federal Law of the Russian Federation "On Personal Data" No. 152-FZ of July 27, 2006
[7]Privacy Act of 1974 (United States).

consent. This provision aims to ensure a balance between the right to privacy and freedom of information. Without the individual's consent, any actions related to the processing of information about their personal life (including collection, storage, transfer, or use) are considered unlawful. Exceptions are possible only in cases expressly established by law.

Of particular importance is the requirement of confidentiality: parties to civil law relationships are not entitled to disclose personal information acquired during the performance of contractual obligations, unless otherwise required by the contract or the law. The use of private information in scientific, literary, or artistic works must also respect the rights and interests of the individual; violation of these requirements is considered an interference with privacy.

A citizen whose rights have been violated has the right to file a lawsuit demanding the removal of illegally obtained information, the cessation of its dissemination, and a ban on its further use. The court may also order the violator to destroy any physical media containing such information. The law provides that after a person's death, the right to demand protection of their privacy belongs to their closest relatives: children, parents, and surviving spouse. This ensures the continued legal protection of personal interests even after the death of the individual [8].

In the US, regulation is decentralized: Privacy The 1974 Act applies to government agencies, while the 2018 CCPA [9]applies to private companies, guaranteeing consumers' rights to access and delete data. In comparison, Uzbek legislation is more declarative, the concept of subject consent is underdeveloped, and there is no effective oversight or accountability mechanism.

In the United States, the approach to personal data protection is decentralized. The founding act is the Privacy Act . The 1974 Act regulates federal government activities, establishing requirements for the collection, use, and storage of citizen information. However, in the private sector, regulation is carried out at the state level. The most significant act is California. Consumer Privacy The Consumer Privacy Act (CCPA) of 2018, which grants consumers the right to know what data is being collected, request its deletion, and prohibit the sale of information to third parties. Thus, the American model is based on the principle of "information self-governance," giving citizens the ability to control the use of their own data.

However, the American system also has certain shortcomings: the lack of a unified federal data protection law creates fragmented enforcement and complicates cross-border regulation. Differences between states, such as between California and Texas, lead to legal uncertainty and increased administrative costs for businesses. However, the flexibility of the American approach allows for rapid adaptation to technological innovations, making it attractive to the commercial sector.

Unlike these jurisdictions, Uzbek legislation on personal data, enshrined in Law No. ZRU-547 of July 2, 2019, is more declarative. It lacks a detailed mechanism for civil protection, nor does it establish a system for subject consent in its modern forms (for example, revocable electronic consent). Furthermore, the law does not define criteria for "adequate protection" for cross-border data transfers, which hinders international cooperation and the participation of Uzbek companies in global digital services.

Chapter 5 of the Law of the Republic of Uzbekistan "On Personal Data" establishes a set of public and private law guarantees aimed at ensuring the security, confidentiality, and integrity of citizens' personal data. Unlike previous versions, the current structure of this chapter's provisions reflects the integration of the national regulatory model with international data protection standards, including the provisions of the EU GDPR and the provisions of Council of Europe Convention No. 108.

Article 27 formulates the general principle of state responsibility for creating an effective legal mechanism for protecting personal information. A systematic analysis reveals that the legislator identifies three levels of guarantees:

Legal level – consolidation of the rights and obligations of subjects and operators of personal data, including sanctions for violation of the established regime;

[8]Civil Code of the Russian Federation (Part One). https :// www . consultant . ru / document / cons _ doc _ LAW _ 5142/9 c 307 a 0 f 2164645 c 15 ca 4 e 3146 ff 5 f 6 e 56060 b 23/

[9]California Consumer Privacy Act (CCPA), 2018.

Organizational level – implementation of internal control procedures, instructions, regulations and data processing audit;

Technical level – application of certified means of information protection, encryption and secure storage.

Thus, responsibility for upholding citizens' rights is divided between the state as the guarantor and data processors as the direct executors. A central element is the individual's right to protection from interference with their privacy, which is consistent with the provisions of Article 27 of the Constitution of the Republic of Uzbekistan and Article 17 of the International Covenant on Civil and Political Rights.

Article 27^1 is a manifestation of the state's digital sovereignty, aimed at ensuring territorial control over data processing. The obligation to host servers and databases of citizens' personal data exclusively within Uzbekistan serves as a tool to minimize cross-border risks and the leakage of confidential information. The introduction of a database registry ensures the transparency and accountability of operators and allows the state to oversee the activities of digital economy entities. This territorial binding does not preclude the need for international data exchange, but it does require an adequate protection regime similar to the principle enshrined in Article 45 of the GDPR.

The law establishes a fundamental principle of personal autonomy: the prohibition of the dissemination and disclosure of personal data without the subject's consent. Unlike information openness, the confidentiality of personal data is mandatory, meaning it cannot be restricted by contract, except in cases expressly provided by law (for example, at the request of a court or investigative body).

It should be noted that the legislator has established not only the obligation not to disclose data, but also liability for its illegal use, including cases where information is used for scientific, literary, or commercial purposes without the subject's consent. This approach is consistent with the principle of " data Minimization — minimization of the volume of processed data and the purposes for which it is used.

Article 29 introduces an important distinction between confidential and open information. Data disclosed voluntarily by the subject is considered publicly accessible. This provision enshrines the principle of informed consent and provides for the possibility of revoking consent, ensuring a dynamic legal regime for personal data. The creation of open sources (phone directories, internet resources , biographical databases) is permitted only with written consent and the possibility of subsequent deletion of the information. This framework is intended to prevent the imposition of open access and ensure citizens have control over their digital image.

A significant aspect is the right of a subject to demand the exclusion of information from open sources not only upon personal request, but also by decision of a court or authorized body, which strengthens judicial protection and makes it a preventive tool.

Overall, the provisions of Chapter 5 form a comprehensive model for personal data protection based on the principles of legality, fairness, proportionality, and transparency. Their systematic interpretation demonstrates that the legislator seeks to combine privacy guarantees with digital security requirements, creating conditions for building trust in e-economy institutions and government online services.

Further development of this area requires the adoption of by-laws detailing the procedures for cybersecurity , operator certification and cross-border data transfer, as well as strengthening the institutional role of the Authorized Body for Personal Data Protection as an independent regulator.

It's also worth noting the inadequate institutional framework for oversight: the authorized government agency, the State Personalization Center, primarily performs registration and coordination functions, while its powers to investigate violations, impose sanctions, and protect the rights of personal data subjects are clearly limited. The lack of an effective accountability mechanism, including administrative and civil measures, reduces citizens' trust in digital platforms and hinders their right to privacy. Therefore, a comprehensive modernization of Uzbekistan's legislation, taking into account the principles of the GDPR and practices in the Russian Federation and the United States, is urgently needed. This will create an effective system for the civil protection of personal data.

It would be appropriate to include in the Civil Code of the Republic of Uzbekistan a provision explicitly recognizing personal data as an intangible asset. It is also necessary to clarify the procedure for compensation for moral damages in the event of violation of personal data rights, and expand the powers of the authorized body by providing for an administrative investigation mechanism. It is necessary to implement the right of data subjects to data portability and the "right to be forgotten," following the example of the GDPR . Clear criteria for the liability of personal data database operators should be established, including in the area of cross-border transfer.

Personal data is an important element of an individual's legal status. It is closely linked to the right to privacy and requires comprehensive civil law regulation. Improving the legislation of the Republic of Uzbekistan in line with international standards will increase trust in digital services and ensure a balance between the interests of the individual, society, and the state.

LEGAL ASPECTS OF PROTECTING THE POPULATION AND ENTREPRENEURS DURING THE TRANSITIONAL PERIOD OF ACCESSION TO THE WORLD TRADE ORGANIZATION

Yakubov A.
Tashkent State University of Law

Summary: *The article is devoted to the analysis of the legal, economic, and institutional aspects of Uzbekistan's accession to the World Trade Organization (WTO). It examines the key advantages and risks of trade liberalization, including its impact on national producers, small businesses, and socially vulnerable groups. Special attention is given to the transitional period — a legally justified stage for the gradual implementation of WTO obligations, ensuring the adaptation of the national economy to the conditions of international competition. Based on a comparative analysis of the experiences of countries with transition economies (Kyrgyzstan, Ukraine, China, and others), various strategies of WTO accession — from "minimal liberalization" to "liberal trade policy" — are identified. The article emphasizes the need for Uzbekistan to develop a balanced approach that combines the protection of the domestic market with the fulfillment of international commitments. The article provides a detailed examination of three key areas of legal adaptation. First, Utilizing WTO-permitted exceptions to the principles of the most-favored-nation regime and national treatment in order to support local producers. Second, simplifying trade procedures as a tool for reducing costs and enhancing transparency, including digitalization, the development of a "single window" system, and the creation of a legal framework for administrative regulations. Third, ensuring transparency and openness in the legal system in accordance with WTO standards, which contributes to strengthening human rights, improving the efficiency of public administration, and reducing corruption risks.*

Key words: *World Trade Organization (WTO); Uzbekistan; transitional period; trade liberalization; trade policy; legal protection mechanisms; international competition; trade facilitation; openness; transparency; national treatment; most-favored-nation regime; support for small business; protectionism; economic adaptation.*

Uzbekistan's accession to the World Trade Organization (WTO) implies the opening of the national market to international competition. This process brings not only economic advantages but also certain risks for vulnerable population groups and small businesses. In this regard, particular importance is attached to the analysis of legal protection mechanisms that can be implemented during the transitional period — before and immediately after accession to the WTO. The transitional period represents a legally justified timeframe for the gradual implementation of WTO obligations. It plays a crucial role in ensuring social stability and economic adaptation, allowing the state to introduce reforms flexibly without destabilizing domestic markets.

Drawing on international experience, several key factors affecting the activities of economic entities can be identified. The benefits and losses from WTO accession largely depend on the commitments undertaken by the candidate country during multilateral and bilateral negotiations on market access with WTO members, as well as on the chosen strategy of market liberalization.

For instance, Kyrgyzstan joined the WTO on December 20, 1998. Membership in the organization provided the country with a new model of economic development and a legal framework aligned with international standards. Since 2002, Kyrgyzstan's trade turnover has shown steady growth, with trade expansion rates with WTO members exceeding those with non-members, particularly in import volumes.

Currently, Kyrgyzstan maintains trade and economic relations with nearly 120 countries, most of which are WTO members. Despite the liberalization of trade policy, customs revenue increased more than threefold between 1999 and 2009, according to the Ministry of Economic Development and Trade of Kyrgyzstan. Moreover, the assumption that liberal trade conditions hinder foreign

investment has not been confirmed — since 2001, foreign direct investment has grown steadily, with a sharp increase in 2006–2007 reaching USD 200 million.[10]

It should also be noted that excessive liberalization may even lead to the bankruptcy of national producers. A vivid example of this is Ukraine's accession to the WTO, where the wine industry was among the first to feel its impact. The Ukrainian markets opened up to Western products while, at the same time, becoming technologically closed to Ukrainian wine. After the reduction of import customs duties, a flood of cheap grape juice and wine materials poured into Ukraine from Moldova, Georgia, Turkey, Azerbaijan, and other countries. For instance, Moldovan and Georgian wine raw materials were sold at a price of 2 hryvnias per liter, whereas the production cost of one liter of primary Ukrainian wine material for domestic wineries was 3–4 hryvnias. As a result, the products of Ukrainian grape growers became uncompetitive. Grape prices dropped to 50 kopecks per kilogram (with a cost price of 2 hryvnias), and even at that price, they could not be sold — some farms did not even begin the grape harvest.11.

When joining the WTO, each candidate country, taking into account the rules and norms of the organization, has a certain degree of flexibility regarding the restrictions and liberalization of its trade regime.

International practice shows that states tend to pursue either a strategy of "minimal liberalization" or a "liberal trade policy," while some combine elements of both. Countries that adopt the "minimal liberalization" strategy during WTO accession negotiations seek to open their domestic markets as little as possible — just enough to secure admission to the Organization. As a rule, such candidate countries are unable to achieve substantial access to the markets of other states. They seek to maintain a high level of protectionism in order to use it as a reserve for improving their access to foreign markets in future rounds of trade negotiations.

Some of these countries, such as Russia, employ this strategy when inefficient state-owned enterprises are undergoing restructuring. A significant level of protectionism is necessary for them during the transitional period. These countries usually submit initial proposals to bind import tariffs at levels considerably higher than those currently applied in practice.

Some transition economy countries that have recently become members of the WTO — such as Albania, Estonia, Georgia, Kyrgyzstan, Latvia, and Mongolia — although they pursued different strategies during the accession process, have adopted a "liberal trade policy" strategy in most areas.12.

This strategy implies the following:

a) binding most tariffs at a low level;

b) agreeing to liberalize the trade regime in agriculture and the services sector;

c) signing instruments such as the Agreement on Government Procurement, which enhances competition and transparency in the functioning of national markets.

China's accession to the WTO in 2001 combined elements of both strategies and raised a number of additional issues. 13.

Firstly, China used the process of accession to the WTO as an opportunity for substantial trade liberalization and the implementation of large-scale reforms.

Secondly, China — which in many respects can be considered a transition economy — positioned itself as a developing country and sought to obtain the right to a transitional period within the WTO framework, as well as a special and differential status granted to developing countries under WTO agreements. This status includes the waiver of the reciprocity principle, granting privileged market access and other benefits.

The formulation of a country's WTO accession strategy and the assessment of evolving opportunities for its businesses in foreign markets should be carried out simultaneously. Therefore, it is essential to analyze the key trends in the development of international trade.

State Support for Domestic Economic Entities within the WTO Framework through Exceptions.

As practice shows, in international trade, restrictions on access to national markets for imported goods are increasingly applied on the basis of exceptions provided in WTO Agreements to the fundamental principles of this international organization, primarily:

the Most-Favored-Nation (MFN) principle;

the National Treatment principle;

the principle prohibiting non-tariff restrictions.

In international trade, there are significant deviations from the Most-Favored-Nation (MFN) principle, while WTO rules continue to be observed. According to approximate estimates, the share of export and import goods traded under discriminatory conditions (in one form or another) accounts for between one-third and one-half of global trade turnover.14

Foreign trade operations outside the MFN framework can occur in a number of cases. First, it is necessary to carefully study the WTO-permitted exceptions to the MFN principle. The most obvious possibility for deviating from MFN is related to regional agreements. Article XXIV of GATT provides exceptions to MFN for customs unions, free trade areas, as well as temporary agreements that precede the establishment of such arrangements. Deviations from this regime are also envisaged in the application of the Generalized System of Preferences. In modern conditions, WTO members increasingly justify the need to use general exceptions to restrict access of foreign goods to their markets in order to protect the life and health of their populations.15

Secondly, WTO documents provide for the application of RNBs to 'like (similar) products'. This raises the question of what constitutes 'similar products', which is usually linked to commodity classification and the setting of customs duty rates.16 It is not always easy to determine exactly how the obligation to provide RNB applies.

The United States also uses the Jackson-Vanik Amendment to deny the Most-Favored-Nation (MFN) status to certain countries. The text of the Jackson-Vanik Amendment is contained in Section IV of the U.S. Trade Act of 1974. Its main purpose is to prohibit granting MFN status in trade ("normal trade relations" in U.S. legal terminology) to countries with non-market economies that restrict their citizens' right to emigrate.

The Jackson-Vanik Amendment was passed by Congress in 1974. It was proposed in October 1972 by Senator Henry Jackson and Congressman Charles Vanik to pressure Communist bloc countries, including the USSR, due to violations of human rights, particularly the right to freely emigrate. At that time, Soviet authorities tried to prevent a "brain drain" by imposing various barriers on citizens wishing to emigrate, including high fees and refusal to issue necessary documents.

The list of countries to which the Jackson-Vanik Amendment currently applies has gradually decreased. The U.S. has granted normal trade relations to Armenia, Georgia, China, Kyrgyzstan, Latvia, Lithuania, Ukraine, and other countries—all members of the WTO. Today, the U.S. does not grant normal trade relations only to Cuba and North Korea. With the introduction of freedom of emigration in the USSR, the Jackson-Vanik Amendment lost its original significance.

The trade relations of the United States with eight former Soviet republics (Azerbaijan, Belarus, Kazakhstan, Moldova, Russia, Tajikistan, Turkmenistan, and Uzbekistan) are still formally subject to the Jackson-Vanik Amendment, but they benefit from a temporary waiver. To establish a

permanent and unconditional Most-Favored-Nation (MFN) trade status with these countries, the U.S. Congress must pass the corresponding legislation.17

Granting imported goods a treatment no less favorable than that afforded to competing domestic goods provides foreign suppliers with greater certainty regarding the regulatory framework governing their activities. At the same time, the requirement to provide national treatment often provokes dissatisfaction or disputes between countries, since it touches on domestic taxation and regulation and is therefore closely linked to reasonable and justified measures of national policy, which are not necessarily aimed at restricting imports and are consistent with GATT obligations.

In international practice, deviations from the national treatment of foreign goods most often occur on the basis of permissible WTO exceptions to national treatment, primarily general exceptions under this regime, as well as exceptions under GATT Article III:8 in the context of government procurement.18

At the same time, when a WTO member country modifies its exceptions to national treatment, other states often seek to challenge the legitimacy of its position.

2. Simplification of trade procedures. For companies operating globally, and especially for small and medium-sized enterprises (SMEs), the sheer number and complexity of national regulations themselves constitute trade barriers. Concern arises not only from the increasing number of required documents and procedures but also from the fact that they vary significantly across regions and countries. Both the measures companies must take to comply with domestic and foreign rules, and the long processing times at the border, are important cost factors.

After eight years on the WTO agenda as one of the Singapore Issues, the organization's members finally recognized the importance of this matter, and in the summer of 2004, they began negotiations on trade facilitation. The outcome is yet to be seen, but the negotiations focus on specific measures to simplify trade procedures. Concluding an agreement—albeit not as comprehensive as initially envisaged—is becoming increasingly likely.19

There is no single definition of the term "trade facilitation." Rather, it is defined differently depending on the discussion forum. For example, in 2001, the OECD defined it as "the simplification and standardization of procedures and related information flows necessary for the international movement of goods from seller to buyer and for the reverse flow of payments." The United Nations Economic Commission for Europe (UNECE) defined it as "a comprehensive and integrated approach to reducing the complexity and cost of trade operations and ensuring that all such activities can be carried out efficiently, transparently, and predictably, based on internationally recognized norms, standards, and best practices." For the purposes of this article, the term will be used in the WTO sense—as "the simplification and harmonization of international trade procedures, including activities, practices, and formalities related to the collection, presentation, transmission, and processing of data necessary for the movement of goods in international trade."20

In the current conditions of globalization, trade facilitation has become an important factor in enhancing the competitiveness of the economy. Uzbekistan's accession to the WTO requires not only the reduction of tariff barriers but also the harmonization of procedural mechanisms regulating the movement of goods across borders. Trade facilitation helps reduce costs, increase transparency, and attract investment.

Trade facilitation is an integral part of Uzbekistan's commitments on the path to WTO membership. Legal and institutional transformation in this area will make it possible to:

reduce costs for foreign economic activity participants;

improve Uzbekistan's positions in international rankings (Doing Business, Trade Logistics Index);

stimulate export development and attract investment.

The implementation of WTO provisions should be accompanied not only by technical but also by legal changes aimed at increasing transparency, legal certainty, and regulatory efficiency.

In conclusion, regarding trade facilitation in Uzbekistan, the following measures can be proposed:

Full digitization of procedures through the transition to electronic declarations and the introduction of mobile solutions.

Expansion of the "single window" system by connecting all control and authorized agencies.

Legal regulation of service provision timelines, in particular for customs clearance, certification, licensing, and other procedures.

Creation of an independent appeals commission to resolve disputes between businesses and regulatory authorities.

Drafting a Law on Trade Facilitation in Uzbekistan.

Transparency in the WTO Legal Framework In addition to trade facilitation, transparency norms in the WTO legal context are directly and indirectly aimed at addressing issues within the domestic administrative legislation of its members.

Despite ongoing debates on whether Western liberal-democratic values conflict with Eastern cultural traditions in developing countries, Western transparency standards have recently gained both international and domestic recognition. They are now considered a key component of effective governance and public policy, applicable to both the public and private sectors. Christopher Hood and David Hild even described the recent emphasis on transparency as being "quasi-religious in nature."21. Transparency is an essential condition for democracy and is often seen as a panacea in the fight against corruption and poor governance. However, as with other "quasi-religious" phenomena, the nature and scope of transparency are not always clear. In this article, we will attempt to analyze the sources, adoption, and potential impact of transparency norms.

The demand for greater transparency is inevitably linked to what many commentators consider one of the fundamental human rights: the Freedom of Information (FOI). Article 19 of the Universal Declaration of Human Rights (UDHR), adopted by the United Nations General Assembly on December 10, 1948, collectively defines the basic rights of every person worldwide as follows: "Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive, and impart information and ideas through any media and regardless of frontiers. "This establishes the international foundation for the connection between transparency and the free flow of information.22

Professor Anne Florini stated that Article 19 establishes a connection between the right to know and the right to speak. A free press is meaningless without the freedom to be informed. 23.

From a broader perspective, many scholars argue that the right to access documents held by government authorities should be recognized worldwide as a fundamental human right for several reasons, such as ensuring full participation in political activity and guaranteeing the functioning of democracy.24 More specifically, Mark Bovens (2002) emphasized that information rights should be regarded as an element of citizenship, part of constitutionally regulated civil rights, constituting a crucial step toward addressing existing accountability problems.25

Many scholars emphasize the role of the WTO as a "policy conduit."26

In the legal context, WTO transparency norms, ranging from Article X of the General Agreement on Tariffs and Trade (GATT) 1947 to Article X of GATT 1994, have been regularly

Econ., U.S. Int'l Trade Comm'n, Working Paper No. 2006-04-A, Apr.

utilized by developed countries, whose strong economic power and reputation in the international community subsequently allowed them to impose their standardized policies on the WTO legal system.

The transition period at the beginning of WTO membership provides Uzbekistan with the opportunity to gradually implement legislative changes, minimizing negative impacts on domestic producers and entrepreneurs. During this period, the following measures are envisaged:

Elimination of subsidies and preferences: From January 1, 2025, subsidies and preferences provided to support exports, as well as low-efficiency tax and customs incentives, are planned to be abolished.

Unification of tax rates: Introduction of uniform VAT and excise tax rates for both the domestic market and imports.

Gradual liberalization of customs duties: Establishment of customs duties based on agreements with other WTO member states.

In addition, as part of its preparation for WTO accession, Uzbekistan is taking steps to improve consumer protection:

Simplification of certification procedures: Abolishing mandatory certification for certain goods, which reduces administrative barriers and increases the availability of products on the market.

Improvement of product labeling: Amending the labeling requirements for imported goods in the state language, which enhances consumer awareness.

DEVELOPING THE PHYSICAL QUALITIES OF YOUNG WRESTLERS THROUGH ACTIVE GAMES

Khalekov R.M.
Karakalpak State University named after Berdakh

Summary: *The article describes the theoretical and practical experiences of the development of physical qualities of wrestlers, the role of mobile games in the training of young wrestlers, and the technology of improving their technical and tactical skills.*

Keywords: *wrestling, active games, speed, selection, technical, tactical training, improvement, technology, sport, training, exercise.*

In recent years, consistent measures have been implemented in the republic to popularize physical education and sports, promote a healthy lifestyle among the population, create the necessary conditions for the physical rehabilitation of people with disabilities, and ensure the country's worthy participation in international sports arenas. [1]

The rapid development of children's and youth sports, the new tasks facing the training of young athletes, require more flexible coordination of the means and methods used by coaches. A game is a very physical activity, therefore it is of great importance in educational activities with children and youth. Open games are widespread among various types of children's and youth games. A distinctive feature of outdoor games is the specific role of actions within the game (running, jumping, throwing, shooting, passing and catching the ball, resistance, etc.). The movements of this tool are harmonized with the game plot (theme, idea). They are aimed at overcoming various difficulties and obstacles on the way to achieving the goal of the game. All players have an element of competition (each for themselves or each for their team), as well as mutual support and respect in the interests of achieving the goal. Collective games are characterized by a constantly changing situation in the game and require quick reaction from players. Therefore, relationships are constantly changing throughout the game: each child strives to create the most advantageous situations for themselves or the team compared to the "opponent." [2]

Open games contribute to the development and improvement of physical abilities. Furthermore, they develop and reinforce natural movements and individual skills acquired in gymnastics, track and field, basketball, volleyball, and other sports. When using outdoor games, it is important to remember that games serve as an auxiliary, supplementary exercise in the system of tools used in the learning process. Their importance should not be overestimated, and at the same time, their use for solving pedagogical problems at various stages of sports development should not be ignored.

In the long-term training process for highly qualified athletes, the continuous use of designated relay and game exercises not only creates opportunities for the effective development of speed, endurance, strength, agility, and speed qualities but also serves as the basis for mastering technical and tactical capabilities in a short time. [3]

Rooster fight

The game is played on the field, in the hall, or in the corridor.

Preparing for the game. A circle with a diameter of 2 meters is drawn on the ground. All players are divided into two teams and stand face-to-face in two rows near a circle. One leader is assigned to each team.

The characteristics of the game. The leader immediately separates the player from their team, and they enter the circle, holding their hands back and standing on one foot. As soon as a signal is given, they nudge each other with their shoulders and bodies, pushing and trying to get them out of the circle. The player who knocks their opponent out is considered the winner and earns one point for their team. Then, right in the middle, the next pair of "roosters" enter. The game continues until all the children have played the role of the rooster. The team with the most points is considered the winner.

Rules of the game.

1. If a player puts their other foot on the ground within the circle, they are considered lost.
2. If both players leave the circle when pushing each other, no one is considered the winner, and the next pair of roosters begins.
3. The roosters begin to fight only after each signal is given.
4. During fight, it is also forbidden to lower your hand.

Educational and upbringing value of the game. This game contributes to the growth of students' strength and helps them become quick-witted and comprehensible. The game cultivates the ability to give true recognition to one's own strength and the strength of one's peers, as well as the qualities of endurance to achieve the goal.

In this game, the players try to defend the honor of their teams. This, in turn, helps them develop a sense of responsibility to their team and the ability to correctly allocate the strength of the players in their team.

Resistance and struggle are the main actions in this game. These movements alternate with breathing. Each player participates in the game 1-2 times and watches the game for the rest of the time.

Methodological guidelines. This game cannot be divided into teams; players come to the center to compete voluntarily. The winning player remains on the field and competes with any new player who wants to fight them. As a result, the game continues. At the end of the game, the most successful players will be determined. If there are many players, they can be divided into four groups and play in two rounds. The manager must monitor the players' use of correct techniques. Sometimes the players nudge their opponents with their hands. This must not be allowed. During the "Rooster fight" game, attention should also be paid to maintaining roughly equal strength.

Pull over the line

The characteristics of the game. The players are divided into two equal teams. Both teams include players who are approximately equal in height and weight. A line is drawn through the center of the square or hall. The teams line up face-to-face from both sides of the line. Players of equal height and weight should be placed in front of each other. The scoring team stands 4-5 steps ahead of each team.

The game begins with the starter's signal. Each team tries to pull many of the other team's players over the line to their side. A pulled-over player must approach the accountant of the pulling-over team and touch their palm to their palm.

Only then will they have the right to cross the line and play for their team again. The accountants keep track of the players drawn. For each drawn player, the team receives one point. The team that scores the most points wins the game.

Rules of the game.

1. The player can only be pulled by holding their hand.

2. Several players can be drawn at once, in pairs, and simultaneously.

3. A player whose two legs are drawn across the line is considered to be drawn across.

4. It is forbidden to pull players by their clothes or feet.

Note. This game can be continued for up to a minute. After a short break, the game is repeated once more. Children with grown nails are not allowed to play.

Special movements of the game - holding and pulling, entering into a circle.

The characteristics of the game. Eight players are divided into 4-5 teams. Four circles are drawn on the ground, each with a diameter of 1-1.5 meters. Around each circle, two representatives of four teams, that is, 8 players, hold hands with each other. One counter (pointer) is assigned for each round.

The game begins with the leader's signal. Players walk in a circle, moving to the left or right (marked in advance) side, pulling and squeezing each other while keeping their hands in place, attempting to bring or stop the players within the circle. The player who steps into the circle loses 1 point. Those who let go of their hand while walking around the circle also lose points. After each mistake, the game is briefly stopped. Players who step into the circle are given the opportunity to step outside, while those who disengage their hands are given the opportunity to shake hands again. The team that receives fewer penalty points than the other team's players is considered the winner.

Rules of the game

1. After each break in the game, the direction of movement around the circle (right or left) is changed.

2. Rudeness in the game (blind nudge, kick, etc.) is prohibited.

The specific actions of the game are to hold hands and resist the "opponent's" strength.

Enclosing in a circle.

Game preparation: Students are divided into two equal teams. The players of the first team join hands to form a circle. The players of the second team take their places in the center.

The characteristics of the game. After the teacher's signal, the players standing in the center of the circle attempt to break out of the encirclement.

The players of the first team try to prevent them from escaping. The game continues for a set period of time. After that, the teams switch places. The team that manages to keep more players from the opposing team within the encirclement is considered the winner.

Rules of the game.

1. It is forbidden to tear off the players' hands and leave.
2. Jumping over hands is prohibited.
3. It is possible to crawl under the arm.

If the game is organized in an open area with soft soil, it is permitted to leave the enclosure in any way.

Conclusion: The physical qualities, tactical and technical preparation of young wrestlers are of particular importance for the results of athletes. A correctly constructed strategy allows for reliable execution during matches and provides the opportunity to defeat the opposing team. Without technical and tactical training, it is impossible to achieve high results. Without developing wrestlers' physical qualities (strength, speed, endurance, agility, flexibility), it becomes difficult for them to use these tactical and technical skills during their games.

In the training of young wrestlers, the parallel development of their psychological qualities is of paramount importance. It should be noted that achieving success in wrestling in certain situations requires not only the high development of all qualities, skills, and abilities, but also the development of quick thinking, analytical skills, the ability to differentiate, accurate assessment, attention, memory, anticipation, endurance, intelligence, and agility.

IMPROVING THE MANAGEMENT OF TOURISM DEVELOPMENT IN THE CONTEXT OF CROSS-BORDER TERRITORIES (USING THE EXAMPLE OF THE REPUBLIC OF KARAKALPAKSTAN)

Naurizbaev A.R.
University of Innovative Technologies

Summary. *In the Republic of Karakalpakstan, the tourism complex of the economy has unique cultural, historical and other potentials. Increasing the effectiveness of this activity requires taking into account regional peculiarities, including the cross-border nature of the territory. Based on the analysis of a number of studies, the article identifies sources of income from tourism activities and identifies some ways to improve industry performance management.*

Key words: *economic efficiency growth, regional tourism development, industry efficiency management.*

Tourism is a special branch of the modern economy. This industry is gaining the status of an industry and in many countries (USA, France, Italy, Great Britain, Greece, Spain, Egypt, etc.) is one of the most effective sectors of the economy.

Many studies have been devoted to the problem of economic efficiency of tourism. Thus, studying the modeling of the tourism potential of a regional entity, S.V. Zemlyak, O.M. Gusarova, E.V. Ganicheva, V.M. Kondrashov, "identified the factors constraining the development of the tourism industry of a regional entity, determined the influence of various types of trend models characterizing the dynamics of the incoming tourist flow of the region and its growth rates." In addition, they "performed an analysis of the quality of the constructed linear and nonlinear trend models. Recommendations have been formulated for the development of the tourism cluster of the regional entity." They noted that "Russian regions use various marketing mechanisms to promote regional tourism products based on their own understanding and awareness of the role and place of the tourism industry in the strategy of regional development"[1,4]. At the same time, the latter is assessed as a negative factor.

In their study, Kazybaikyzy A., Mukhanova A.E., Smagulova Zh.B. conducted a "brief analysis of the features of tourism development in the world", considered "the main functions of tourism as an industry (realization of value and consumer value contained in a tourist product, organization of the process of bringing a tourist product to the consumer (tourist), economic provision of material incentives to work); factors influencing the development of modern tourism; the positive and negative sides of the tourism industry (general economic factors, socio–demographic factors, cultural and socio-psychological factors, personality and behavioral factors)" [2, 6]. They also reviewed the prospects for the development of the tourism industry.

Gamidova A.E., and V.A. Plotnikov, studying the development and effectiveness of tourism as a type of economic activity, came to the conclusion "regarding the methods and expediency of state support for tourism in the future." [3, 5].

Considering the prospects of domestic tourism, Mamanabieva N.I., Muminova A.Z. note that "over the past few decades, there has been a significant surge in tourism development. This phenomenon has brought numerous benefits to the economy, culture and the population of the country, but it also creates a number of problems that need to be solved." They considered the prospects and problems of tourism development in Uzbekistan, highlighting the opportunities and obstacles faced by this sector" [4,3].

Exploring the socio-economic effectiveness of tourism, M. Morozova, based on an analysis of modern economic literature, shows "that the problem of researching the effectiveness of tourism activities is currently one of the debated and not fully developed. Distinguishing features of traditional and broad approaches, the expediency of using a new ("network") approach is substantiated, which differs from the existing ones in the following provisions reflecting modern ideas about the theory and methodology of research on the socio-economic effectiveness of tourism activities. He also notes

that at present "the content of the research object is expanding; the content is deepening and the nature of the research subject is becoming more complicated.... and the key task of performance management is changing" [5.6].

L. M. Shayakhmetova, exploring the issues of economic efficiency of investments in the tourism industry of the Republic of Kazakhstan, studied "mechanisms for attracting investments for the effective development of the tourism industry in the Republic of Kazakhstan and issues of consolidating investments in the industry" and identified "development prospects by analyzing the current situation." She "studied the indicators of the effectiveness of the investment process in the tourism industry and determined the prospects for development by analyzing the current situation." [6.3]

O. I. Kapustina, investigating the development of domestic tourism, believes that it is "necessary to replenish the budget, create new jobs, improve the lives of the population, and that public authorities need methodological tools to determine the most appropriate combination of forms and types of domestic tourism for a particular territory, as well as a mechanism for using the available resource base" [7. 9].

Researchers D.N. Shaikin, D.O. Abutalip, A.J. Bekmatova, considering the issues of assessing the dynamics of sustainable development of the tourism economy in the Republic of Kazakhstan, "supplemented the methods of assessing the dynamics of sustainable development of the tourism economy in modern conditions" [8.6].

Thus, these developments show the breadth of the geography of researchers, the complexity of the topic under consideration, and the availability of various approaches and methods of solutions.

The main feature negatively affecting the effectiveness of the tourism business in the region under study is the cross-border nature of the territory of Karakalpakstan.In the north and northeast, the Republic borders on sparsely populated areas of Kazakhstan, and on the south with sparsely populated areas of Turkmenistan. Karakalpakstan is located far from the industrial centers of Uzbekistan, such as the Ferghana Valley, Tashkent and Samarkand agglomerations with high population density. The region, with its unique masterpieces of cultural heritage, gets inadequate results as a result. According to an estimated estimate, as a result of such a dislocation, the tourism business of Karakalpakstan loses up to 40-45% of local tourism visits and up to 17-25% of foreign tourism, which must be taken into account in the strategic plans for the development of the industry.

It should be noted that over the years of independence, there has been a significant increase in the number and quality of facilities that make up the tourism infrastructure, and the human resources potential of the industry has grown. The task of the researchers is to find new ways to increase the efficiency of tourism, so that it becomes a powerful sector of the regional economy and ensures a multiple increase in employment due to the creation of new jobs with decent wages.

The literature notes that the development of tourism activities can play a crucial role in the rise of regions characterized by low indicators of economic development. Tourism has a multiplier effect, stimulating various sectors of the economy and creating new opportunities for local communities. In the context of depressed regions, tourism can become a powerful catalyst for:

1. Creating jobs and increasing incomes of the population:

Direct employment: The tourism industry provides a wide range of jobs, ranging from low-skilled positions (maids, waiters, drivers) to those requiring special training (guides, instructors, hotel managers). This is especially important for regions where traditional industries are in decline and where unemployment is high. By providing alternative sources of income, tourism helps to reduce social tensions and improve the quality of life of the population.

Indirect employment: The development of tourism stimulates the growth of related industries such as agriculture (food supplies for restaurants and hotels), transport (taxi services, bus transportation), handicrafts (production of souvenirs and traditional products), construction (construction of new accommodation facilities and infrastructure). This creates additional jobs and increases the incomes of the population employed in these related sectors.

Entrepreneurship: Tourism provides opportunities for the development of small and medium-sized businesses. Locals can open their own guest houses, restaurants, souvenir shops, organize

excursions and workshops. This contributes to the development of an entrepreneurial culture and the formation of a middle class, which is an important factor for sustainable economic development.

2. Stimulating economic growth and economic diversification:

Attracting investments: The tourism potential of the region can attract both domestic and foreign investments in infrastructure development, construction of hotels and other accommodation facilities, and the creation of entertainment complexes. Investments in tourism contribute to the modernization of the region's economy and increase its competitiveness.

Increase in tax revenues: The development of tourism activities increases tax revenues to local and regional budgets through income taxes, VAT, tourist tax and other taxes. These funds can be used to develop infrastructure, education, healthcare and other socially significant projects, improving the quality of life of the population.

Economic diversification: Tourism can become an alternative to traditional but declining sectors of the economy. By developing the tourism sector, the region reduces its dependence on one or more types of activities and becomes more resilient to economic shocks. This is especially important for regions where the economy is heavily dependent on mining or agriculture.

3. Preservation of cultural heritage and the environment:

Raising awareness of cultural heritage: Tourism promotes the cultural heritage of the region by drawing attention to historical monuments, traditions and customs of the local population. This stimulates interest in the preservation and restoration of cultural heritage sites, as well as supports the development of folk crafts and crafts.

Promoting environmental protection: The development of eco-tourism contributes to the conservation of the region's natural resources and biodiversity. Tourists who come to the region to enjoy its natural beauty are interested in preserving the purity of the environment. This creates incentives for the introduction of environmentally friendly technologies and farming methods, as well as to combat poaching and illegal logging.

Community Support: Tourism can be a tool to support local communities by providing them with access to new markets and opportunities.

The development of rural tourism allows farmers to sell their products directly to tourists, and the development of ethnographic tourism allows locals to share their culture and traditions with guests.

4. Infrastructure development and quality of life

improvement: Infrastructure construction and modernization: The development of transport, energy and communal infrastructure is necessary for the development of tourism. The construction of new roads, airports, power plants and water supply systems improve the quality of life not only for tourists, but also for local residents.

Improvement of services: Competition in the tourism industry stimulates the improvement of the quality of services. Hotels, restaurants, shops and other service businesses strive to provide their customers with the best possible service, which leads to higher standards of service and an improved quality of life in the region.

Improving the level of education and qualifications: Qualified personnel are needed to work in the tourism industry. The development of tourism stimulates the creation of new educational institutions and training programs for specialists in the field of tourism and hospitality. This increases the level of education and qualifications of the population, which contributes to its competitiveness in the labor market.

However, in order for tourism to truly become a catalyst for the economic development of a depressed region, a number of important factors must be taken into account.

Integrated approach: The development of tourism should be part of a comprehensive strategy for the development of the region, taking into account its specifics, resources and potential. It is necessary to take into account the interests of all stakeholders, including the local population, business, government and environmental organizations.

Sustainable development: Tourism should be developed in a sustainable manner, minimizing the negative impact on the environment and cultural heritage. It is necessary to introduce

environmentally friendly technologies and farming methods, as well as support the development of responsible tourism that benefits local communities.

Human capital development: It is necessary to invest in education and professional training for the tourism industry. It is important to train the local population in service, management and entrepreneurship skills so that they can successfully participate in the development of the tourism sector.

Marketing and promotion: It is necessary to effectively promote the region as a tourist destination using modern technologies and marketing strategies. It is important to create an attractive image of the region and attract the target audience of tourists.

Government support: The government should support the development of tourism in depressed regions by providing tax incentives, subsidies and grants for investors and entrepreneurs. It is important to create a favorable investment climate and stimulate the development of small and medium-sized businesses in the tourism sector.

In conclusion, the development of tourism activities can become a powerful tool for boosting the economic development of the region in question. However, this requires careful planning and management of tourism development, taking into account its social, economic and environmental impacts. With the right approach, tourism can become a catalyst for sustainable economic growth, improving the quality of life of the population and preserving cultural heritage and the environment. It must be remembered that tourism is not a panacea, and it must be developed in conjunction with other measures aimed at diversifying the economy and creating new opportunities for the local population. Consideration of potential sources of effectiveness of the tourist complex has shown that some of them are not actively used, further research should be conducted to increase the impact of these sources. Only in this case, tourism will be able to make a significant contribution to improving the socio-economic situation in the region.

INFLUENCE OF EXOGENIC FACTORS ON ECONOMIC GROWTH (ON THE EXAMPLE OF THE REPUBLIC OF KARAKALPAKSTAN)

Sitmuratov Sh.T.
Karakalpak Institute of Agriculture and Agrotechnologies

Summary. *The article is based on the need to assess the impact of exogenous factors on economic growth. The impact of exogenous factors on economic growth in GRP growth was assessed based on statistical analysis. Based on the results, proposals and recommendations for the innovative development of the region have been developed.*

Key words: *economic growth, exogenous factors, endogenous factors, Solov model, innovation, investment, models of economic growth.*

Growth is an indicator of a country's economic situation. Economic growth is necessary for any country. Economic growth serves as the basis for solving socio-economic problems in the country, is the primary factor in the development of an innovation-based economy, and is the main result of scientific, technical, and institutional development. Economic growth is achieved through the sustainable development of the national economy.

Economic growth is a complex, multifaceted phenomenon studied by all theoretical schools of economists.

In the Address of the President of the Republic of Uzbekistan to the Oliy Majlis, "Ensuring macroeconomic stability and curbing inflation is the main task in the process of economic reforms..." was defined as a program and target task that needs to be implemented in the economic sphere in 2020 and subsequent years. In solving these tasks, the main directions were defined as "introducing an inflation targeting system," "reducing prices by ensuring healthy competition," "developing a strategy for creating a competitive environment in the economy," "further strengthening control over the targeted and rational spending of budget funds," "deep analysis of the factors of the emergence of the "shadow economy," and defining a program to combat it.[1]

The problem of choosing exogenous or endogenous models of economic growth is currently one of the central problems of economic growth theories. Recently, the theory of economic growth has become a separate, relatively separate part of economic theory. Nevertheless, this phenomenon is not yet complete for a final interpretation and drawing clear conclusions. Consequently, the main goal of the policy makers of each country should be the elimination of factors limiting economic growth and the correct use of economic laws for future development, having an understanding of the factors that caused previous development. These circumstances make it relevant to develop effective mechanisms for using exogenous and endogenous growth models of the economy.

Literature review. Despite the fact that the theory of economic growth as a separate branch of economic science was formed at the beginning of the 19th century, many fundamental ideas were expressed much earlier. For a historical and economic analysis of the development of modern growth theory, representatives of the classical political school, whose political ideas served as a starting point for 20th-century scholars, made a fundamental contribution.

Theories of exogenous and endogenous economic growth require factor analysis. The theory of exogenous growth helps to determine the possibilities of balanced growth in the country's economy[2] and to find the factors that determine long-term economic growth.[3]

Most studies conducted by world economists focus on approaches to determining economic growth in relation to factors in the production of products per capita.

The presence of the factor of exogenous technological development of economic growth, while allowing for continued growth in per capita income in the country, does not provide information about the reasons for the growth. Therefore, the policy of economic growth loses its essence, since the main growth factor of an exogenous nature cannot influence state policy. According to Solov's theories, by changing the internal factors of economic growth (in particular,

budget and tax mechanisms), the state cannot provide long-term growth opportunities for economic growth rates.

Romer sees technology as "endogenous," a central part of the economic system, and a key driver of growth. In his opinion, although any technological breakthrough is random, in general, the economy has determined through economic growth models that it develops in direct proportion to the funds spent on technologies. According to Solov, the technology is "exogenous," that is, random, and seems to have simply fallen from the sky.[5]

Scientists of our country, Makhmudov N.M., Khakimov Kh.A., classify new theories of endogenous growth into 4 groups, including new Keynesian theories of economic growth, new classical theories of economic growth, empirical theories of economic growth, new theories of endogenous growth.

From scientific sources and empirical research, it is clear that without studying all important models of exogenous growth, it is impossible to ensure sustainable growth. General conclusions on this matter have been proven in the scientific research of the following scientists: Harrod[7] and Domar[8], Solow[9], Swan[10], Barro[11] (1996), Alhassan[12], and others.

In general, the emergence of new economic systems in our republic in recent years requires an assessment of the factors ensuring macroeconomic stability and economic growth indicators based on exogenous system models.

Methodology. The increased attention to the problems of economic growth in the region is explained, on the one hand, by the need to equalize regional imbalances in their economic development, and on the other hand, by the interdependence of macroeconomic and regional processes: changes at the regional level sometimes lead to unexpected consequences at the macroeconomic level and radically change the trend of economic growth.

Taking into account scientific theoretical approaches, it is possible to build models of economic growth based on the methodology of ordering exogenous growth factors recommended by Russian scientists for building an economic growth model[14]. As the main dependent variable expressing economic growth, indicators of the growth of gross regional product (GRP) and foreign trade turnover over time per capita are used. Independent variables influencing economic growth include the following endogenous factors:

Expenses for technological innovations:

Investments in fixed capital;

Foreign direct investment;

Regression equations are obtained based on the SPSS package statistics.

Analysis and Results. Despite unfavorable environmental conditions, ensuring macroeconomic and social stability and implementing reforms in all sectors of the economy have positive trends. The region's economic growth rates were higher than the national average in 2005-2017 (3.0 times) [14].

In recent years, a number of positive shifts have occurred in macroeconomic indicators. Thus, the share of industry in the gross domestic product increased by 26.7 percent. The gross regional product has grown, and this trend can also be observed per capita.

It was calculated without foreign direct investment, which was chosen as an exogenous variable influencing economic growth. The main reason for this is the presence of foreign direct investment in the structure of total investments.

Model results for assessing the influence of selected exogenous factors on economic growth

Model		Non-standard coefficients		Standard coefficients	T	N
		B	Standard error	Beta		
1.	(Constant)	218,659	502,999		0.435	0.675
	Innovation costs	0.527	0.192	0.390	2.750	0.025
	Investments	0.822	0.246	0.367	3.340	0.010
	Export	11.108	3.851	0.339	2,884	0.020

The main results of the obtained model are reflected in the table, where the volume of GRP per capita increases by 0.527 thousand soums due to per capita expenditures on innovations. Also, due to investments per thousand soums per capita, the volume of GRP will increase by 0.822 thousand soums. The main factor ensuring economic growth is exports, and it was determined that due to the export of thousand soums per capita, the volume of GRP will increase by 11.108 thousand soums. From these facts, it is clear that economic growth is mainly associated with the volume of exports. This circumstance leads to the conclusion that economic growth relies more on the export of raw materials.

The results of the obtained model for assessing the impact of direct investment on economic growth as an exogenous factor are presented in the table below.

Model results for assessing the influence of selected exogenous factors on economic growth

Model		Non-standard coefficients		Standard coefficients	Non-standard coefficients	N
		B	Standard error	B		
1.	(Constant)	552.155	463.959		1.190	0.268
	Innovation costs	0.862	0.162	0.638	5.308	0.001
	Foreign direct investment	1.354	0.421	0.246	3,213	0.012
	Export	11.445	3.939	0.349	2,906	0.020

The data show that due to foreign direct investment per thousand soums per capita, there is an increase in GRP by 1.354 thousand soums, the coefficient of determination according to the selected statistics R^2 =0.976. This circumstance confirms that the impact of foreign investment on economic growth is higher than that of domestic investment.

Summary and recommendations. Based on the analysis results, it is necessary to accept growth theories in two main approaches. The first is the development of various approaches to the process of economic growth, its sources and main factors. In this case, it can be obtained mainly by analyzing and understanding the ideas of scientific schools in the field of economics and the opinions of representatives of economic sciences. The second approach involves creating models specific to each country based on economic growth theories.

The results of the analysis conducted to assess the influence of exogenous factors on economic growth made it possible to determine that the development of the region relies only on raw material exports. In turn, the role of innovations and investments in ensuring the possibilities of economic growth was practically not felt. Taking these circumstances into account, it is recommended to develop targeted strategic programs to increase the influence of the following exogenous factors on ensuring economic growth in the republic:

The low effectiveness of investments attracted to the region in relation to economic growth (excluding future investment returns), the lack of systematic attention to existing natural, environmental, and demographic factors in investment policy reflect the inefficient use of attracted investments. Taking this circumstance into account, the direction of investments in the region should be considered as a priority.

The study also revealed that the role of funds implemented in the region and spent on innovation in ensuring economic growth is not high. Most of the innovations being implemented in the republic are technological innovations, and it is recommended to direct the funds allocated for innovations to process and marketing innovations. The factor of entrepreneurship is considered as an important factor in the competitiveness of the region and national innovation systems. The development of education, science and technology, and the creation of favorable institutional conditions for innovative growth should be considered a priority.

Economic growth of the region, first of all, the recognition of human and intellectual capital as strategic resources, as well as their effective use for economic purposes, should be considered as the main strategic direction.

All of the above justifies the need to develop fundamentally new theoretical and methodological approaches to the formation of an innovative system. Expansion of the use of global intellectual property and information systems as an exogenous factor of economic growth also has a positive impact on economic growth.

COMPETENTIAL APPROACH TO THE DEVELOPMENT OF STUDENTS' CREATIVE ACTIVITY

Ibraymov I.E., Redjepova S.J., Narbayeva N.J.
University of innovation technologies

Summary: *The article presents information on some problems related to the competency-based approach in the development of creative activity of students of higher educational institutions and their solutions.*

Key words: *student, creativity, competence, creativity, competency-based approach, component, professional activity, creative activity.*

A number of scientific studies are being conducted on improving heuristic technologies for the development of students' creative competencies based on the priority of qualimetric aspects, clarifying the didactic principles of designing innovative models for preparing future teachers for problem-based social activity. In particular, in higher education, the improvement of the methodological system for the development of students' creative competence through the orientation of subjects towards professional fields, the expansion of pedagogical opportunities for enhancing students' creative abilities based on the design of problem-based learning technologies, and the development of methodological methods for forming students' thinking abilities are of particular relevance.

The theoretical foundations of the implementation of the competency-based approach in our country are reflected in the research works of U. Inoyatov, N. Muslimov, O. Musurmanova, B. Khodzhaev, and others.

In the countries of the Commonwealth of Independent States, the main content of the formation of students' creative abilities was studied by O.Butorin, E.Zeer, I.Sukhikh, N.Khryasheva.

In the scientific research of foreign scientists K. Rogers, R. Sternberg, P. Torrance, A. Maslow, practical and technological aspects of the development of creative thinking and creative abilities are reflected.

The concepts of "creativity" and "creative" come from the English language and mean the ability to create, creativity. Although the initial interpretations of these concepts were studied by D. Simpson, S. Kaplan, J. Renzulli, and other scientists, in our opinion, the views presented in their research are not sufficiently substantiated.

When comparing the definitions of "creativity" in the psychological dictionary and "creativity" according to P. Torrance, it was revealed that these two terms differ from each other: flexibility of thinking, the desire to seek new knowledge, the ability to go beyond existing "templates." When talking about creative activity, it is advisable to think about the nature of the combination of these two terms [4].

The process of developing students' creative activity based on a competency-based approach forms professional and creative competence in the specialist. Based on the analysis results, the following components of creative competence were identified within the framework of the study [2. P. 7-8]:

- motivational-personal component - the need for creative activity, awareness of the personal and social significance of creative activity, active manifestation of interest in the results of the creative process, awareness of the need for constant self-improvement;
- cognitive component - operations of creative thinking and cognitive methods (analysis and synthesis, comparison, generalization and classification, concretization, induction and deduction, abstraction, modeling); algorithms and strategies of creative activity;
- activity component - reliance on problem-research methods in the implementation of creative activity; personal readiness to apply algorithms and strategies of creative activity;
- reflexive - evaluative component - a person's readiness to assess their capabilities and make adjustments to subsequent actions in order to determine productive methods of creative activity.

Summarizing the results of studying the concept of "preparation for professional activity," reflected in psychological and pedagogical literature, I. Sukhikh established different levels of preparation for professional activity. Based on these levels, the levels of students' readiness for creative activity are designed according to the following table (Table 1) [3. P. 49].

Table 1.Levels of students' preparation for creative activity

Levels	Indicators
Personal-creative	Formation of personal abilities necessary for carrying out creative activity.
Functional-creative	The ability to use physical and mental resources necessary for creative activity.
Personal-activity-creative	A holistic manifestation of creative, personal qualities and skills that allow one to effectively perform assigned problematic tasks.

Thus, based on the analysis of creativity, creative activity, creative thinking processes, components of creative activity, as well as criteria, indicators, and levels, the following conclusions were made:

1) according to the methodological structure of creative activity, the following tasks of its formation can be distinguished:

- development of motivational and personal orientation of students towards the profession being mastered;
- equipping with technologies for organizing creative activity;
- formation of methods of reflection and objective self-assessment, skills of emotional and volitional management of creative activity.

2) From a socio-pedagogical point of view, the main task is the formation of creative activity in students at a level that provides them with effective educational and professional activity and develops the ability to acquire independent knowledge throughout life.

3) Clarification of the concept of "criteria for assessing the levels of development of creative activity" as a qualitative indicator of personality development, requiring a certain period and expressing various manifestations of creative activity [5. -142 p].

Further expansion of the development of students' creative and analytical thinking skills, the introduction of research into the educational process by research institutions, as well as in developed foreign countries

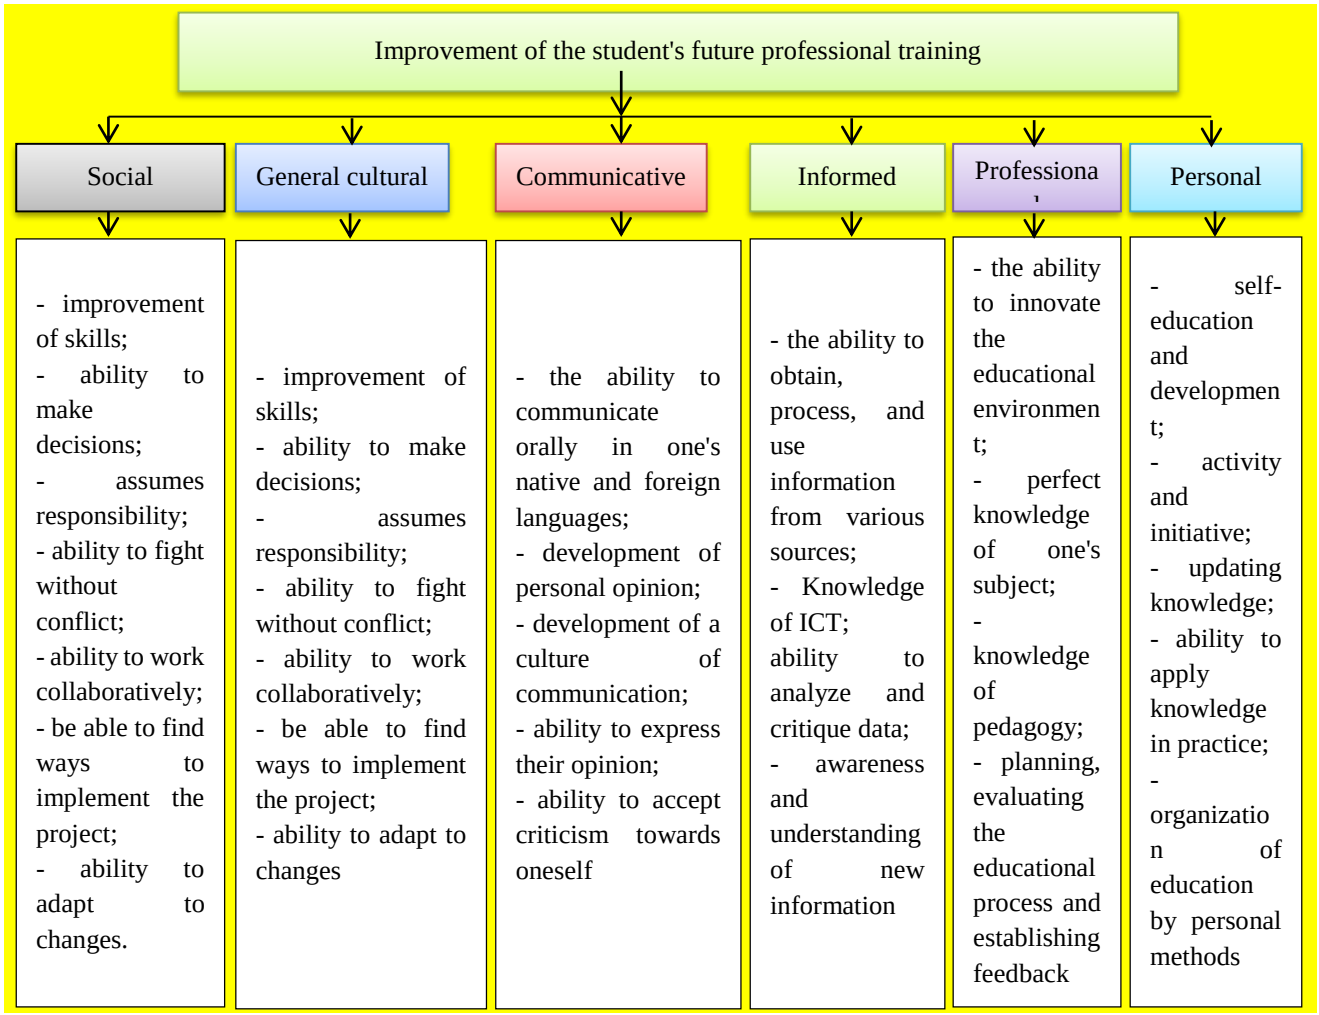

Figure 1. Mechanisms for improving the professional and methodological training of students

In conclusion, it should be noted that in the development of students' creativity: the student's attitude to the educational process, the subject, and the educational material; a clear definition of the educational goal; a thorough justification of the educational content; effective and interesting organization of the educational process; the teacher's creative approach to the organization of the educational process; the correct formation of the educational material in accordance with the students' theoretical knowledge and level of training; the appropriate, purposeful, and effective use of didactic, modern technical, and information and communication tools in the educational process; the correct choice of optimal methods for the teacher to fully reveal the essence of the educational material; the organization of an educational lesson in an effective form, based on the needs, desires, and interests of students; the teacher's sincere, trusting attitude towards students.; taking into account the individual and personal characteristics of each student, as well as their mental activity during the training process; clearly defining the expected result in accordance with the educational goal is extremely important. Therefore, when organizing the educational process, it is necessary to pay attention to this aspect of the issue.

COGNITIVE BASICS OF PROJECT EDUCATION IN THE TRAINING OF CIVIL ENGINEERS

Eshniyazov R.
Karakalpak State University named after Berdakh

Summary: *This article examines the current state of project education in the engineering field, and in particular in civil engineering, and its role in shaping students' creative and cognitive skills. Despite the widespread introduction of the project method into educational programs, many approaches remain limited by the framework of traditional problem solving, without revealing the potential of design as an integrating learning mechanism. Special attention is paid to the cognitive basis of project activity, including constructivism, steady-state learning and the theory of cognitive flexibility, which contribute to students' ability to adapt knowledge to new contexts and conditions.*

Key words: *project, project education, cognitive flexibility, Ustoz-shogird system, scaffolding*

Introduction. Project-based education is widely promoted as a method for developing creative problem-solving skills. National education standards and qualification requirements for construction disciplines include in their criteria an integrative design experience, usually implemented as a core course, typically a thesis project, which is actually carried out during the final year of study [1]. In addition, many departments, faculties, and even universities in the field of engineering education pay special attention to the development of innovative project activities to improve the level of engineering training.

However, the considerable efforts of individual universities and even specialized councils do not address the cognitive basis of design and do not fully utilize design activities as a mechanism for integrating and consolidating the technical training that underpins engineering programs. Thus, the large volume of published works describing specific examples of design courses in civil engineering bachelor's degree programs suggests that design education, as it is currently implemented, may not address the fundamental questions of what it means to engage in engineering design and may not fully prepare students for real-world design work. In this article, we will examine not only the background of current work in the field of engineering design, but also the spectrum for understanding how design can be implemented to improve undergraduate programs, and discuss alternative models of engineering design.

There is a vast amount of material devoted to discussing engineering design and formulating theories about design, and this work will not present an exhaustive discussion of the many ideas about what design is, nor will it attempt to derive a comprehensive theory of engineering design.

We will also not describe theoretical work in the field of computer-aided design or design support here. However, we will present an overview of different perspectives on the nature of design and what design education should include. We will consider works on education in the field of engineering design, both in the form of final courses and in introductory courses, and make comparisons with education in the field of architectural design.

Project-based education as an integrative form of education. Design is a creative and integrative activity that combines higher-order cognitive skills, i.e., analysis, synthesis, and evaluation, to create an artifact that may be physical or otherwise. This broad definition encompasses the various perspectives with which specific disciplines view design activity. Computer design researchers often discuss routine, adaptive, and creative design. These descriptions embody varying levels of originality and innovation. For example, many computer scientists (and especially artificial intelligence researchers) characterize design as a problem-solving procedure that is best performed by searching a solution space (the range of possible solutions to a given problem) for the solution that best satisfies a given set of criteria. They usually refer to this type of design as routine. Routine design can also include simple detailing of structural elements, such as determining the cross-section of steel beams or calculating the required cross-section of reinforcement in reinforced concrete based on the

required resistance—something that many engineering educators consider to be mechanical problem solving.

Adaptive design involves accepting existing solutions and modifying them as necessary to meet a new set of criteria. In engineering, this may involve modifying designs to change support conditions and is often identified with research in the field of computer-aided reasoning based on specific cases. Viewing design in either of these ways may suit researchers who need to translate design decisions, rules, and procedures into computer code, but these perspectives ignore much of the design activity that relies more on innovation and creativity. Although routine and adaptive aspects are certainly part of design, this work will focus more on the creative aspect.

Creative design focuses on an original response to a specific situation, stimulus, or set of criteria, and although lessons learned from previous projects and prior experience may be incorporated into a new project, the designer must come up with a solution that is unique to that set of conditions. The more artistic qualities of design reach their peak at the other end of the design spectrum, starting with computer science, in the visual arts (painting, sculpture, and even, to some extent, architecture), where the more artistic, creative, and nonlinear diversity of design is embraced. It is in this creative dimension of design that the locus of real engineering also lies.

Theoretical schools of design. All these different points of view, generated by the context and practice of design in various fields, contribute significantly to differences of opinion both about design theory itself and about how design should be taught. The various schools of design theory can be divided into three groups. The first school is the traditionalist view that design is "empirical in nature" and that creativity cannot truly be taught, a view that also opposes scientific design theory. This group usually includes the traditional contingent of the visual arts. The second group, as a reaction to the first, consists mainly of engineering scientists and others, in general, analysts who see no real content in design education. This group argues that no meaningful design discipline can emerge until it can be expressed in mathematical terms. At this end of the spectrum, with this more rigid view of design, is the part of the computer science community that seeks to reduce the design process to a set of rules encoded on a computer. The third and final school represents a more modern view of design, which encompasses much of the traditional school but requires a degree of scientific approach to the study of design. The basic principle of this group is that design is a cognitive activity that can be studied by cognitive scientists.

Nevertheless, there is a widespread belief among engineering professors and students themselves that a "project" is something that is taught in a strictly limited task of solving higher-level classroom work, for example, in reinforced concrete or steel "design," which can truly be called detailing. Typical curricula tend to view engineering education as largely based on engineering disciplines and focused on analysis and clearly defined questions with specific answers. While some advanced educators have demonstrated a deeper understanding of the overall picture of design, the small number of projects that exist in most current curricula often simply take the form of more open-ended problems that have multiple alternative solutions. Some argue that design is more than just solving an open-ended problem, characterizing it as a highly integrated process that requires more time and effort to teach and learn.

Further evidence that engineering educators are beginning to pay more attention to design education can be seen in how some authors draw inspiration from resources such as Teaching Reflective Practice: Towards a New Design of Teaching and Learning Professions [2]. The book offers a look at how knowledge is structured differently in formal education and a guide to bringing this knowledge and real-world learning closer together, including teaching and practical activities. It proposes reflection in action as the key to engineering knowledge, implemented in a reflective workshop where students learn design not only by acquiring theoretical knowledge, but also by interacting with their teacher-trainers in problem-solving, formulating and rethinking questions, experiments, demonstrations, simulations, hypothesis testing, and frequent debates and discussions.

Reflexive practice in project-based learning. Reflective practice aligns with many ideas in cognitive theory about learning in the ustoz-shogird style and can lead to critical thinking and continuous learning. Recently, researchers and administrators have begun to call for a critical

evaluation of engineering education in terms of whether it prepares students to become engineers. The shortcoming of current curricula is that they teach engineering as problem solving rather than decision making, do not consider external influences on how a project should be evaluated, and do not consider uncertainty. Therefore, we must improve the curriculum by including the tools engineers need so that students become good designers. Project-based education has much to offer in equipping students with these tools. However, the culminating experience of designing may not be sufficient to teach students how to design, or perhaps more appropriately, to enable students to learn how to design. This thesis aligns with a view of design that is more closely aligned with the more traditional empirical version found in architecture schools, combined with a recognition of the cognitive skills and benefits provided by and inherent in design education.

Design activity is inherently constructive; designers actively outline, develop, and create an object or artifact. Therefore, many implications of constructionism can be applied here. As discussed earlier, many other cognitively oriented computer-based educational tools also use design as a constructive activity to organize student learning. It is important to note that design activities, even when embedded in a software environment, are much more than just using software. Students are actively involved in creating the artifact, provided and inherent in design learning.

Project development begins at the very beginning, as the designer must define the problem, a particularly important component of engineering design, since problems are usually not clearly defined, providing context for constructive activity to define the solution: literally, creating context for building the solution. The designer must also integrate the relevant knowledge necessary to create a solution; extract stored knowledge or learn new information as necessary. Using a combination of experience, trial and error, creativity, and heuristics, the designer creates or designs a product or solution that meets the project requirements.

Once a solution or set of alternatives has been generated, the designer can compare the available options to find the best solution and assess how well the chosen solution meets the design criteria. Successful design may require several iterations of these tasks. The above description is not a rigid definition of the design process, but rather a way of illustrating the constructive activity inherent in design.

The cognitive basis of project-based learning. The cognitive skills underlying these activities stem from higher levels of Bloom's taxonomy: analysis, synthesis, and evaluation. These activities are present in both students and practicing designers, but are performed at different levels of proficiency. Although these cognitive skills may be, and in fact often are, separated into distinct parts of the design process, an alternative and perhaps more accurate model is recognized as the internal interdependence that these skills imply in design activities. Although each of Bloom's levels includes skills that lie below, these cognitive skills become even more intertwined when carrying out a project [3]. This connection is due not only to the iterative nature of design (where evaluation occurs during reanalysis), but also because a project combines skills into a single stream of activity. During problem definition, which is often viewed as an analysis procedure, designers actually evaluate criteria, for example, by sorting them by importance, or synthesize the problem definition from previous experience.

Integration of project-based learning into engineering programs. Perhaps a more effective model of design activity, especially for such a complex and cognitively demanding field as civil engineering, is cognitive flexibility, which not only illustrates how constructive design activity is, but also provides a better understanding of the various possibilities that a designer must learn and have at their disposal in order to be successful. The theory of cognitive flexibility asserts that the traditional constructivist model of retrieving intact knowledge structures is incomplete and that instead, the designer must flexibly reconstruct relevant background knowledge into a useful set of information specifically tailored to the particular situation or task. This kind of knowledge reassembly is vital for effective problem solving in complex, poorly structured, and open-ended domains such as civil engineering, and for work above the elementary level of education. Furthermore, in helping students learn and engage in design, cognitive flexibility does not reduce problem solving to simplified

examples, but rather immerses the student in the complexity of the problems and then helps the student cope with that complexity.

Cognitive learning also offers some specific advantages for design education. The methods of ustoz-shogird and situational learning are evident in many aspects of design studio work. Through closer interaction with the studio instructor, who guides students' learning, authentic projects, and by offering a more comfortable learning environment and powerful assessment mechanisms through studio critiques and jury reviews, the studio effectively provides the benefits of cognitive learning and problem-based learning for design education. Scaffolding, built into the studio, also supports instructional design using a cognitive flexibility model. The cognitive basis of design is given special attention because, although it is not always explicitly discussed by practitioners and researchers in the field of design, the cognitive foundations of constructivism, especially the ideas of spatial cognition, cognitive learning, and cognitive flexibility, strongly influence both how a project is made and how it is studied.

Conclusion. Thus, project-based education, as currently implemented in most civil engineering departments, does not seem to be realizing its potential as a central organizing element of the engineering curriculum and educational model. The idea that design is an empirically acquired skill, the teaching of which can be based largely on cognitive science, raises further questions about whether design education in engineering schools is being considered in the proper context, because design is often viewed simply as the solution of open-ended problems. When used centrally, as in the architectural school model, the project can serve as the primary integrating tool and driving force behind the curriculum, helping students actively acquire and apply engineering knowledge, as well as laying the foundation for students to recognize the need for continuous learning skills and support their development.

EXPERIENCE OF DEVELOPED COUNTRIES IN ASSESSING THE DIVERSITY OF BANK LOANS

Naurizbaev A.R., Kaipbergenov K.A.
University of Innovative Technologies

Summary: *This article presents a thorough analysis of foreign experience in assessing collateral for bank loans. Focusing on the examples of the USA, Germany, and Great Britain, the study reveals different approaches and strategies applied in these countries. The article examines the key principles and methods of valuation, their advantages and disadvantages, as well as current challenges and prospects in the field of collateral valuation.*

Key words: *collateral valuation, bank loans, foreign experience, USA, Germany, Great Britain, valuation methods, valuation challenges.*

Collateral valuation plays a vital role in bank lending operations by protecting financial institutions from potential credit risks. Although the collateral valuation process is gaining more attention in emerging markets, many of them have not yet fully adapted to modern valuation methods. At this time, foreign countries with developed financial markets, such as the US, UK and Germany, have already introduced modern and sophisticated collateral valuation methods. In this article, we provide an overview of foreign experience in the field of collateral valuation, which can serve as a model for emerging markets.

Collateral valuation is a critical element in the banking lending industry, as it provides protection to financial institutions from potential credit risks. Methodologies and practices used for valuation of collateral vary considerably from country to country, depending on the level of financial sector development and legal frameworks. Foreign experience in collateral valuation can provide valuable lessons for developing countries.

According to a 2022 World Bank report, approximately 40% of borrowers in developing countries have difficulty obtaining loans due to inefficient collateral scoring systems. In the same countries, the share of overdue loans averages 12%, which is three times higher than in developed countries. These findings highlight the importance of improving collateral valuation systems.

At the same time, developed countries with strong banking infrastructures, such as the US, UK and Germany, have implemented sophisticated and efficient collateral assessment systems to reduce risk and improve access to credit. For example, in the US, the share of overdue loans is only 2.7%, and in Germany this figure is even lower - 1.7%. This speaks to the high efficiency of collateral assessment systems in these countries.

The importance of collateral in the banking system cannot be overestimated. As part of lending, collateral is a guarantee of reimbursement of the bank's funds in the event of default by the borrower. As such, it serves as a powerful risk management tool for banking institutions. Proper collateral valuation is key to building an efficient and stable financial system.

The collateral appraisal process involves assessing the value of the assets that the borrower is willing to pledge as collateral. The assessment is carried out in order to determine their real market value and liquidity, as well as to exclude possible legal problems associated with the ownership of collateral assets.

Correct collateral assessment helps to manage risks, reduce the probability of losses from loan defaults, and also ensures the protection of the interests of all parties in the lending process. For the borrower, this is a guarantee that he will be able to get the loan he needs, and for the bank - that in case of non-payment, he will be able to return the borrowed funds by selling the collateral.

However, despite the importance of the collateral valuation process, many developing countries face problems in their valuation systems. Often these problems are associated with a lack of standards and regulations in this area, an imperfect legal system, as well as a lack of qualified appraisers and insufficient transparency of the appraisal process.

In this article, we review foreign experience in the field of collateral valuation and discuss its applicability in the context of developing countries.

Materials and Methods. Our research data is based on analysis of the banking sector and collateral valuation systems in the US, UK and Germany. We have used publicly available sources of information such as statistical reports, academic papers, reports from international financial institutions, and reports from government agencies. Based on the collected data, a comparative analysis of collateral assessment methods was carried out.

Many scholars and researchers have studied collateral assessment systems in various countries. The main areas of their work can be divided into the following categories: study of collateral valuation methodology, study of factors affecting the valuation, and study of foreign experience.

Levy and Schwartz (1999) deal with the issue of real estate valuation as collateral. The authors emphasize the importance of such aspects as market value, as well as the level of risk associated with the possibility of changes in real estate prices. They also offer a collateral valuation model that takes into account not only the current value of assets, but also the risk of impairment.

Gibler and Schwarzbach's (2004) research focuses on the impact of regulation and the legal system on the valuation of collateral. They conclude that a lack of clarity in legislation can seriously complicate the assessment process and increase risks for creditors.

A report by the International Monetary Fund (IMF, 2005) provides an overview of collateral valuation systems in developed countries. It includes an overview of the main assessment methods used in different countries, as well as their main advantages and disadvantages.

The work of Benton et al. (2007) is devoted to the study of the impact of financial crises on the valuation of collateral. The authors come to the conclusion that financial crises can significantly reduce the value of collateral assets and increase risks for creditors.

In general, the review of the literature shows that the valuation of collateral is a complex and multifaceted process that depends on many factors, including the state of the economy, the market situation, the legal system, and even global financial trends.

Duffie and Garleanu (2017) conducted a study of collateral valuation approaches in the context of financial innovation. They argue that in the era of digitalization and the use of artificial intelligence, new approaches to assessment are needed that can be more accurate and adaptive..

Tan and Stevenson (2018) researched the Australian real estate market and applied several collateral valuation methods. Their work highlights the importance of using multiple approaches to improve the accuracy of the estimate.

The book by Askari and Gonzalez (2019) provides a general overview of collateral valuation methods in different countries, including an analysis of new technologies and valuation algorithms. They highlight the importance of considering local market conditions and regulatory considerations when choosing a valuation approach.

The work of Hofmann and Santos (2021) is an analysis of the application of machine learning in collateral assessment. They argue that the use of artificial intelligence can significantly improve the accuracy of the estimate and reduce the cost of this process.

Results. The analysis showed that in developed countries, various methods of collateral valuation are used, including the market approach, the value approach and the income approach. In the USA, for example, the market approach is more often used, which is based on comparing the prices of similar assets in the market. In the UK and Germany, banks often use an income approach based on the expected return on the asset.

Table 1. Comparative analysis of foreign experience in the field of collateral assessment for bank loans.[27]

[27] Created by the author

Authors	Country/Region	Basic Approaches to Valuation	Features of the approach
Duffie and Garleanu	General review	Use of digital technologies	Emphasis on financial innovation and the use of AI
Tan and Stevenson	Australia	Multiple Approaches	Emphasis on the importance of using multiple methods
Askari and Gonzalez	International review	Use of technologies and algorithms	Emphasis on taking into account local market conditions and regulatory features
Hofmann and Santos	General review	Machine learning	Emphasis on the use of artificial intelligence to improve accuracy and reduce costs

Analyzing the information presented in Table 1, several important conclusions can be drawn.

First, all the countries studied have established detailed regulations and standards for valuation of collateral, confirming the importance of this process for the banking system. Note that most countries actively use the approach based on the assessment of market value.

Second, there is a difference in the degree of regulation of collateral valuation. In some countries, such as the US and the UK, the collateral valuation function is highly regulated and standardized, while in others, such as India and Australia, collateral valuation approaches can be more flexible and varied.

Thirdly, foreign experience emphasizes the importance of transparency and openness in the process of valuation of collateral. This includes not only a detailed description of the valuation methodology and assumptions used, but also the mandatory certification of appraisers and their independence from credit institutions.

Fourth, there are specialized institutions and organizations for valuation of collateral that provide training, certification and ongoing education of appraisers, which contributes to maintaining a high level of professionalism in the industry.

Finally, in practice, many countries have developed unique approaches and technologies for processing collateral transactions, including the use of digital technologies and automated valuation systems.

Comparing the experience of the US, Germany and the UK, one can see interesting differences and similarities in approaches to valuation of collateral.

Germany: In Germany, the field of collateral valuation is also highly regulated, but it is distinguished by a greater emphasis on manual valuation and expertise. In addition to assessing the market value, Germany also applies the principle of sustainable value (Beleihungswert), which provides for a more conservative assessment of the value of real estate, taking into account potential risks.

United Kingdom: In the UK, the approach to assessing collateral is flexible. The valuation of collateral is carried out by licensed appraisers in accordance with the standards of the Royal Institution of Chartered Surveyors (RICS). The collateral valuation system in the UK is notable for its openness to innovation, and digital and automated valuation is currently on the rise.

In general, it can be said that in all three countries the valuation of collateral attaches great importance to reliability and accuracy, although approaches to achieving these goals may differ significantly.

Discussion. Foreign experience in valuation of collateral emphasizes the importance of a diversified approach to the process. Different valuation methods may be applied depending on the type of collateral, its characteristics and market conditions. Based on this experience, developing countries can adapt these methods and customize them to their unique circumstances. However, institutional and regulatory considerations are also important to consider, as effective collateral valuation requires transparent and stable financial markets, reliable real estate and collateral data, and trained valuators.

Due to the significant differences in collateral valuation approaches in the US, Germany, and the UK, as well as the unique market characteristics of each of these countries, it is important to be careful when applying any of these approaches in other contexts.

However, certain conclusions and lessons can be learned:

1. Automation and digitalization: The US and UK are actively using automated valuation systems, which allows for fast and accurate collateral valuation. These aspirations may well be applied in other countries, given the global digitalization trends. At the same time, it is necessary to take into account the risks associated with automation, such as vulnerability to data manipulation and the unpredictability of artificial intelligence.
2. Balance between market and sustainable value: Germany offers an interesting approach using sustainable value in addition to market value. This may be of particular interest to countries with unstable property markets or high levels of economic uncertainty.
3. Strict regulation and professional standards: All three countries adhere to strict professional standards and regulation in the field of collateral valuation. This highlights the importance of having clear and transparent rules in this area.

Based on these findings, countries seeking to improve their collateral valuation systems can explore these different approaches and apply the relevant aspects in their own context, taking into account the specifics of their markets and economic conditions.

Conclusion. Valuation of collateral is a complex process that requires specific skills and knowledge. Foreign experience offers valuable lessons for developing countries seeking to improve their assessment systems. In doing so, it is important to remember that each country is unique and must adapt generally accepted assessment methods to its own conditions and circumstances.

Collateral valuation plays a critical role in bank lending and we can explore different approaches and strategies based on foreign experience in the US, Germany and the UK. Based on this experience, we can draw the following conclusions:

1. **Technology:** The use of new technologies, including automated valuation systems, can significantly improve the efficiency and accuracy of collateral valuation. However, it is important to consider the possible risks associated with this approach.
2. **Valuation sustainability:** Germany's approach to using sustainable value in addition to market valuation can be particularly useful in an environment of economic uncertainty and volatility in real estate markets.
3. **Regulation and standards:** Clear and transparent professional standards and regulation, as in the US, Germany and the UK, are key to maintaining trust and predictability in the collateral valuation industry.

In general, foreign experience offers many lessons and strategies that can be applied in other contexts. However, it is important to remember that each approach requires adaptation to the unique conditions and characteristics of a particular market. Critical analysis and understanding of foreign experience can significantly contribute to the development and improvement of the collateral assessment system in each country.

FORMATION OF THE ECONOMY - THE BASIS OF SUSTAINABLE DEVELOPMENT

Sitmuratov Sh.T.
Karakalpak Institute of Agriculture and Agrotechnologies

Summary: *This article discusses the importance of new ideas and innovations as vital conditions for ensuring the competitiveness of entities to increase the share of export-oriented goods and the total factor productivity of resources (TFP) based on examples.*

Key words: *innovation, competition, market mechanism.*

Our state today is an integral part of the international community and the global financial and economic market. This is evidenced by the ever-expanding ties with the outside world, the implementation of programs for the development, modernization, technical and technological re-equipment of economic sectors with the support of leading developed countries, and the successful implementation of the five priority areas of the country's further development. In the context of globalization, increasing the country's competitiveness, enhancing its economic potential, widespread introduction of innovations, and, on this basis, the rational use of resources are the key to sustainable development and improving the living standards of the population. The purpose of the article is to study the state of development of the republic's economy, factors, efficiency of resource use, and opportunities for sustainable economic growth.

The essence, goals, factors, and process of formation of the economy were studied by domestic and foreign scientists D.Romer, Chen Derek, L.N.Orlova, T.Sh.Shodiyev, and others. In particular, D. Romer considers the formation of an intellectual economy, that is, the economy of knowledge, and the role and importance of innovations in it to improve the living standards of the population and ensure sustainable economic growth at the post-industrial stage of development. He proposed an endogenous model of economic growth and emphasized that intellectual potential, a complex of knowledge, new ideas, and innovations have become the main factors of development. Chen Derek, speaking about the innovative economy, that is, the four pillars of the knowledge economy in his definition: the economic external environment, the knowledge complex, the innovation system, and information and communication technologies, proposed a multifactorial econometric model of economic growth. L.N.Orlova studied the indicators of the innovation economy and the problems of ensuring competitiveness. T.Sh. Shodiev studied the state of creation, important scientific and methodological aspects of the formation and development of the knowledge economy and tried to create its econometric model. As a result of the research, a draft program for the innovative development of the national economy for 2012-2020 was developed at the UN Office in our country.

Methodological approaches to the study of the process of forming a new qualitative stage of innovative development, innovative developments, research on ensuring sustainable economic growth through the introduction of new technologies and products at enterprises are of both theoretical and practical importance. The level of formation of the knowledge economy or, in other words, the innovative economy, statistical indicators and factors, analysis through the combination of qualitative and quantitative methods of analysis, based on econometric models, have not been comprehensively studied. This problem has also escaped the attention of researchers.

The article notes that within the framework of the "2018 Year of Supporting Active Entrepreneurship, Innovative Ideas and Technologies," the intellectualization of economic activity requires increasing the role of intangible resources in production, ensuring the priority of the share of intellectual labor in the volume of goods, and the widespread use of market mechanisms in the liberalization and regulation of the economy. The development of a strategy for the innovative development of the national economy in the future is of great practical importance today. Therefore, in September 2018, the Strategy for Innovative Development of the Republic of Uzbekistan for 2019-2021 was adopted, and measures for its implementation were defined.

When studying the process of innovative development of the economy and the implementation of the Action Strategy, statistical data on the country's development in previous years, dynamic series,

averages, dispersion, variation, correlation, and regression equations were used in their comparison, analysis, and synthesis. Finally, when determining the factors and sources of economic growth, a two-factor model was created and the marginal efficiency of each factor (resource), the limits of resource exchange and optimal combinations were determined, the absolute and relative "net" impact of each factor on GDP was found, the coefficient of total efficiency (TFP) of capital and non-labor factors was determined, and the directions of sustainable economic innovation development were determined.

In the research process, such methods as a didactic approach, systematic and logical analysis, statistical observation, statistical summation, time series, correlation and regression analysis, and economic-mathematical modeling were used. The indicators of the State Statistics Committee's socio-economic development of the country in recent years were used as a database. In the form of a research hypothesis, it is assumed that the formation of an innovative economy is a means of ensuring sustainable development and competitiveness.

In the process of economic globalization, the competitive environment is changing rapidly, which requires companies and enterprises to create innovations and introduce innovations so as not to decline in market conditions. Currently, innovation occurs through the continuous introduction of new products, scientific developments, marketing, and management methods into practice in fundamental research, applied developments, and pilot sites. The logic of technological development and potential markets are equally valuable sources of innovative ideas. In other words, innovations can be created bypassing the stage of scientific research, where the idea arises, the concept is developed, and the development itself is carried out.

Innovation is not always about using a completely new product or process. Innovation is often the effective combination of previously known elements in a new compound. This does not diminish the importance of fundamental and applied research. However, they are addressed when difficulties arise, that is, first the results of practical work are analyzed. In the study of the process of intellectualization of the economy, first of all, the fulfillment of the tasks of the Action Strategy for the further development of the country requires further development and liberalization of the economy, reducing state intervention in the economy, using more market mechanisms in regulating the economy. In an in-depth study of this process, we use production functions.

Today, it is very necessary to develop the innovative potential of the national economy, including its reconstruction in the sphere of small business, to promote the unification of scientific organizations and science-intensive production enterprises in order to introduce high-tech developments and eliminate the consequences of the disconnection of science from production, which occurred during the period of reforms, to directly and indirectly support innovative activity and applied scientific research. Support for the innovative activity of small business entities should be one of the priority areas of state policy in the field of innovation. Small innovative business (SMB) is an integral link in the regional innovation system, a developer of effective innovations, their consumer, and an intermediary between science and production.

It is necessary to recognize the general understanding of the importance of information and knowledge in economic development, to recognize the importance of introducing innovations in ensuring competitiveness in political circles, businessmen, and enterprise managers. This direction cannot be ignored as a factor of development. Society and the economy are considered "reflexive systems," changing the perception of factors of economic growth automatically changes these systems and influences their development. Understanding the importance of knowledge and innovation forms modern management trends that determine, to a certain extent, the behavior of firms in markets and their development strategy. Understanding this at the state level encourages the development of state strategies and programs for the development of a knowledge-based economy. Today, one such strategy is the Action Strategy, which has been adopted and is being successfully implemented.

Intellectual activity testifies to the formation and development of innovative social production. "Innovative production is a production that forms the basis of technologies, know-how, new combinations of production factors, the use of new knowledge embodied in the structure of

organization and management of production, allowing to obtain intellectual income and an advantage over competition. In this case, the sources of innovation changed from traditional research institutes, design bureaus, and relevant departments of R&D to product consumers, marketing departments. At the macroeconomic level, the effectiveness of innovations is manifested in a decrease in the resource intensity of manufactured products per unit of output and an increase in the overall productivity of factors. In recent years, the dynamics of the overall effectiveness of factors in our republic averaged about 3 percent.

Currently, the share of new products and developments in the products manufactured in the country's industries and enterprises is increasing. In particular, the dynamics of innovative goods, works, and services in the sectors of our economy is as follows.

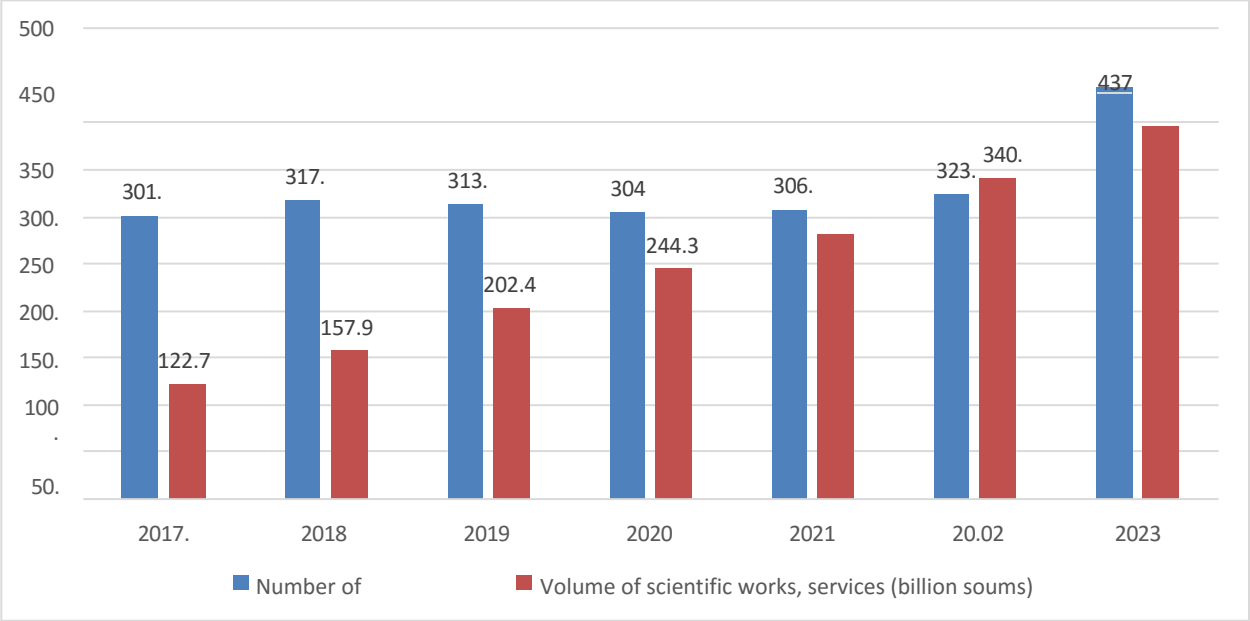

Figure. Dynamics of organizations carrying out research and development work (2020-2023)

It is gratifying that enterprises themselves are finding funds for innovative ideas and developments. If in 2023, innovations were financed mainly from the organizations' own funds (by 69.7%). In 2023, funding from organizations' own funds increased by 6.4 times compared to 2020. An increase in the share of innovative goods, works, and services produced in our country in economic sectors has been observed. The number of enterprises and organizations producing innovative products, works, and services has increased.

Objectively speaking, such laboratories as small business enterprises, startups, incubators are a natural and convenient sphere for the development of innovative processes.Therefore, it is necessary to continue the economic reforms being carried out in our country in terms of supporting innovative ideas and developments in small business and private entrepreneurship enterprises, paying great attention to saving resources at the macroeconomic level, especially the efficient use of intangible resources.

It is advisable to consider an innovative economy as a promising economy, which requires the continuation of the policy of structural transformations and accelerated development of modern industries and production areas based on high technologies, aimed at increasing competitiveness and strengthening positions in the world market, as the main priority. To achieve an innovative economy, it is necessary to: firstly, to establish cooperative relations between education, science, and production; secondly, to finance the production of innovative products by the enterprise based on cooperative relations; thirdly, to create the possibility of applying scientific and technological achievements to the production process of the enterprise; fourthly, to develop measures to create benefits for enterprises producing innovative products.

THEORETICAL AND LEGAL BASIS OF DEPOSIT OPERATIONS

Ismaylov O.K.
Karakalpak State University named after Berdakh

Summary: *This article describes the concept and essence of savings operations, the concept of types of bank deposits, and an analysis of national legislation in the field of regulating savings operations. Also, the legal basis of bank deposits has been thoroughly studied.*

Key words: *Bank deposit operations, deposit operations, deposits of individuals and legal entities, banks and other credit institutions*

The concept of savings operations is defined differently in legislation and legal literature, i.e., in textbooks, study guides, and articles. For example, a deposit operation is the attraction of funds in the form of deposits from banks, credit organizations, their placement, as well as lending operations using attracted deposit funds.[1]. In addition, deposit operations are understood as operations consisting of attracting and placing funds in the form of deposits of individuals and legal entities.[2]. In our view, this definition is too narrow and does not fully reveal the concept of a savings operation.

At the same time, several definitions of the concept of savings operations have been given by scholars in the field of law, and they differ from each other. For example, according to T.E. Rozhdestvenskaya, a savings operation is understood as the attraction of funds by credit institutions from an indefinite circle of persons on the basis of various civil law transactions.[3].

In his scientific work, A.G. Bratko defines deposit operations as follows: "operations carried out to store deposits of individuals and legal entities in a bank are called deposit operations."4].

Some scholars have presented savings transactions in a very simple form. In these definitions, not all elements of savings operations are presented, but only the main ones are emphasized. In particular, according to D.A. Shevchuk, deposit operations are a type of banking operation related to attracting funds in the form of deposits of individuals.[5]. Since this definition represents a narrow range of characteristics, we cannot include it among the generally accepted definitions.

From this point of view, the efforts of some scientists to reveal the essence of savings operations are noteworthy, however, we can see that some features have been omitted in their definitions.

As can be seen from the above definition, a savings transaction mainly consists of the following elements:

Attraction of funds;

storage of funds for a certain period;

return of funds;

accrual and payment of interest for the use of funds.

Like any institution in the field of banking law, deposits are divided into several types.

Various classifications of bank deposits are given in the legal literature. We will consider them below.

Depending on the repayment period, a bank deposit is divided into two types: a demand deposit and a term deposit. In a demand deposit, a bank deposit agreement is concluded before the first demand deposit is received. Term deposits, on the contrary, are accepted by the bank with a fixed term.

Depending on the subjective composition, bank deposits can be divided into two types:

1) deposits of individuals;

2) deposits of legal entities.

In addition, a bank deposit can be divided into a deposit in favor of the depositor or a deposit in favor of a third party.

The types of bank deposits are also legally enshrined in the legislation of the Republic of Uzbekistan.

According to Article 762 of the Civil Code of the Republic of Uzbekistan, a bank deposit agreement is concluded on the condition of issuing the deposit on demand (demand deposit) or returning the deposit after the expiration of the term specified in the agreement (term deposit). In addition, this article stipulates that the bank deposit agreement may also provide for the placement of deposits on the basis of other conditions of repayment not contradicting the legislation.

Banks, in addition to the above-mentioned types of deposits, may accept other deposits that do not contradict the legislation.

Demand deposits of individuals are considered indefinite. The bank deposit agreement must contain conditions for the return of the deposit at the first request of the depositor and the payment of the established interest.

Savings deposits are understood as deposits accumulated under certain conditions and directed for specific purposes with the right to contribute additional funds to the amount of the initial deposit in the manner prescribed by the bank deposit agreement.

For savings deposits, a bank deposit agreement must be concluded between the bank and the depositor, and after the depositor concludes the agreement, the amount of the initial deposit specified in the bank deposit agreement must be deposited. Additional funds may be contributed to savings deposits in accordance with the bank deposit agreement. The procedure for making additional contributions must be clearly defined in the bank deposit agreement.

A distinctive feature of this type of deposit is that the deposit agreement is necessarily concluded and executed under certain conditions. For example, savings deposits can be of targeted, winning, conditional, and other types with specified conditions.

Deposits accumulated for a specific purpose and strictly directed towards this purpose are considered targeted savings deposits.

Deposits in which interest is paid to the depositor in the form of winnings are considered winning savings deposits. Winnings can be in the form of cash, accrual of additional interest on deposits, items, etc.

Deposits raised with the condition of repayment after the expiration of the term specified in the bank deposit agreement are considered term deposits.

For term deposits, a term bank deposit agreement is concluded between the bank and the depositor, and after the conclusion of the agreement, the depositor is obliged to deposit the amount of the deposit specified in the term bank deposit agreement. The procedure for making additional contributions must be defined in the term bank deposit agreement.

If the depositor wishes to demand the return of the term deposit before its expiration, they must notify the bank at least one month before the planned date of receipt of the deposit.

Term deposits can be short-term and long-term. In this case, deposits accepted for a term of one year or less are considered short-term deposits, and deposits accepted for a term of more than one year are considered long-term deposits.

In cases where the depositor does not demand the return of the amount of the term deposit after the expiration of the term, after the occurrence of the circumstances stipulated by the term bank deposit agreement, the agreement is considered extended on the terms of demand deposits, unless otherwise provided by the term bank deposit agreement.

For overdue time deposits, interest is accrued on the terms of the demand deposit, which must be specified in the deposit agreement.

A registered security confirming the right of the depositor (certificate holder) to receive the amount of the deposit made in the bank and the amount of the deposit, as well as the interest stipulated in the certificate, from the issuing bank or any branch of this bank after the expiration of the established period, is a deposit certificate. Savings certificates are issued in documentary form in the form of forms.

Another important feature of deposit certificates is that these certificates can be the object of transactions involving purchase and sale, donation, inheritance, contribution to the authorized capital, and other transactions leading to a change of ownership, as well as pledges.

However, a certificate cannot be used as a means of payment for the purchase and sale of goods or for settlements for services (works) rendered.

Based on the foregoing, it can be concluded that a deep study of the conceptof a savings operation and its types contributes to a sufficient understanding of theessence of savings operations by students, as well as employees working in the field of law enforcement, and the formation of the necessary skills for the practical application of legal norms related to savings operations.

FORMATION OF NATIONAL OPERA AND BALLET SCENOGRAPHY IN KARAKALPAKSTAN

Tleumuratova A.J.
Karakalpak State University named after Berdakh

Summary: *This article examines the main stages of the formation of national opera and ballet scenography in Karakalpakstan through the example of the Berdakh Karakalpak State Academic Musical Theatre. It also analyzes the performances, their thematic scope, and the sketches of stage decorations for operas and ballets.*

Key words: *opera, ballet, decoration, sketch, creativity, theatre, development, dramaturgy, artist-director.*

Opera and ballet are among the highest artistic forms of human culture, embodying musical performance, stage art, scenography, and dramaturgy. These art forms have developed over centuries, enriching both national traditions and the cultural heritage of the world.

When examining the development of Karakalpak opera art, the period before 1938 can be considered the "Initial" stage. This is associated with the establishment of the Karakalpak State Theatre in 1930, where only a small ensemble of folk instruments and a limited number of vocal performers were present. These circumstances define the artistic conditions of that time. In 1936, S. Majidov staged the first Karakalpak musical drama titled **"Bag'dagul".**

Between 1939 and 1973, musical drama performances became dominant on the Karakalpak stage, with around 120 productions being staged during this period. This, in turn, served as a significant impetus for the further development of opera art [1.119].

During the years 1974–1991, the first sparks of national opera art began to emerge in the Karakalpak theatre. This period is considered the **"Formation"** stage. The foundation of the first Karakalpak opera was laid with the work *"Ajiniyoz"*, based on the libretto by **I. Yusupov** and music composed by **N. Mukhammadinov**. Due to the lack of trained specialists, only one act of the opera was staged in 1974. However, by 1987, the complete version of *"Ajiniyoz"* was successfully staged by **O. Uzakov** and **N. Ansatbayev**.

In 1989, the opera *"Maysaraning ishi"* by **S. Yudakov**, directed by **N. Ansatbayev**, also gained significant public attention. This period as a whole is recognized as the stage during which Karakalpak national opera art took shape and developed [2.121].

The libretto of the opera *"Ajiniyoz"* was written by **Ibrohim Yusupov** in 1973. The opera was first staged by directors **O. Uzaqov** and **N. Ansatbayev**, with music composed by **N. Mukhammadinov**. The stage design was created by **Islam Alibekov**, an Honored Artist of Uzbekistan and Karakalpakstan.

After the premiere of the first act of *"Ajiniyoz"* in 1987, the opera was restaged three times. The production was based on the stage requirements of dramatic works and dramaturgy. In the libretto of *"Ajiniyoz"*, the protagonist is depicted as a figure whose life is intertwined with the destiny of his people — reflecting his wisdom and the tragic story of his love.

The events in the libretto take place around the 1860s in the region of **Qo'ng'irot**, particularly in **Bozatau.** The opera consists of **three acts and seven scenes**. The scenes within the acts are divided based on changes in the development of events, setting, and stage decorations.

he further development of opera scenography dates back to the years of Independence. During this period, attention was directed not only to opera, but also to ballet art. In 1996, the ballet *"Ayjamal"* composed by **N. Mukhammadinov** was staged by the ballet master **T. Khojasov**.

During the years of Independence, as all spheres of society developed, the demand for stage works embodying national values and traditions also increased. In this regard, the national opera and ballet arts experienced significant growth. This development can be clearly observed in the repertoire of the Karakalpak State Academic Musical Theatre, where a number of productions in these genres were staged.

The opera *"Aleko"* (1992) by **S. Rachmaninoff** was staged by director **K. Abdreymov** and stage designer **I. Alibekov**. The opera *"Ajiniyaz"* (1994), the ballet *"Ayjamal"* (1996) composed by **N. Mukhammadinov** and choreographed by **T. Khojasov**, with stage design by **I. Alibekov**, were also brought to the stage during this period. The opera *"Tumaris"* (2013) by **Q. Zaretdinov** was staged by directors **K. Abdreymov** and **J. Sultaboyev**, with stage design by **B. Aytmuratov**. The ballet *"Qirq Qiz"* (2015) by **Q. Zaretdinov** was staged by **A. Sharipov** and **Z. Nurimbetov**.

The ballet *"Ayjamal"* (2017) featured stage design by **Z. Soipov**, while the opera *"Gulayim"* (2019) by **N. Mukhammadinov** was staged by **B. Baymurzayev** and **M. Usenov**, with set design by **T. Shardemetov.** The opera *"For the People"* (2020) by **Q. Zaretdinov** was staged by **M. Usenov**, with set design by **T. Shardemetov**. The ballet *"The Star of Umrzoya"* (2021) by **Q. Zaretdinov** was staged by **A. Sharipov**, with set designers **Z. Soipov** and **R. Asqarov**.

The ballet *"The Nutcracker"* (2022) by **P. I. Tchaikovsky** was staged by **Z. Nurimbetov**, with sets by **Z. Soipov**. The opera *"Edige–Tokhtamish–Amir Temur"* (2023) by **Q. Zaretdinov** was staged by **M. Usenov**, with set design by **Z. Soipov**. The mono-opera *"My Aral"* (2024) by **Q. Zaretdinov** was staged by **M. Usenov**, with set design by **Z. Soipov** and costume design by **B. Serekeev.** The ballet *"Nazlimkhan Sulu"* (2025) by **Q. Zaretdinov**, with a libretto by **Z. Nurimbetov**, was staged with set design by **B. Aytmuratov** and **Z. Soipov**, and costume design by **B. Serekeev.** These productions marked the **period of flourishing** of national opera and ballet art.

During these years, the theatre repertoire included genres such as drama, historical drama, musical drama, psychological drama, fairy-tale drama, comedy, musical comedy, tragedy, opera, and ballet. The drama genre has traditionally been central to the theatre's artistic practice. At present, along with productions of various themes and genres, the theatre repertoire also includes theatrical show-concert performances.

In the decoration of opera and ballet performances, pictorial stage scenery is widely used. First of all, the stage designer works with a plane on which various visual compositions are drawn. These may represent landscapes or interior settings, and the designer may attempt to construct them in three dimensions. The scenery may also include stylized decorative motifs that serve as a visual background for stage action. Ultimately, the artist is capable of expressing the conceptual theme of the performance through painting or graphic language on the backdrop, curtain, or special scenic planes, thereby creating a broad visual metaphor. Scenic decoration provides the artist with numerous opportunities to develop diverse stage solutions. It is particularly common in opera and ballet productions, although it can also be used effectively in dramatic theatre [3.36].

Colorful panels are especially suitable for decorating ballet performances. Their conventionality is primarily based on presenting an open flat surface next to the live performers onstage, and this conventionality aligns well with the inherent stylization of the choreographic art. In ballet, it is usually the scenography that carries the narrative. Here, the stage space is primarily a symbolic environment in which dance images evolve freely, while the costumes contribute to creating visual expression through movement. The panel, instead of directly depicting a specific location, is intended to reveal the music and imagery of the performance through the means of visual art.

The formation of national opera and ballet scenography in Karakalpakstan is closely linked to the creative activity of the **Berdaq Karakalpak State Academic Musical Theatre**. The performances staged in this theatre have contributed not only to the broad promotion of the artistic heritage of national culture, but also to the development of contemporary scenographic art. The stage decorations, artistic sketches, and creative explorations of the set designers have played an important role in the rise of national theatre art. At the same time, scenographic innovations, harmoniously combined with national traditions, have contributed to the formation of modern theatrical aesthetics.

CONCEPT AND FEATURES OF THE ACTIVITIES OF MICROCREDIT ORGANIZATIONS

Ismaylov O.K.
Karakalpak State University named after Berdakh

Summary: *This article describes the concept of civil law regulation of microcredit organizations, their specific features, the interpretation of the conclusion and execution of contracts for microfinance services, and their specific features. Also, the foundations of legal regulation of the activities of microcredit organizations have been comprehensively studied.*

Key words: *microcredit organizations, contractual and legal regulation, debt and credit, factoring, bank deposit, bank account, insurance, microleasing*

In the development of the country, a special place is occupied by the level of access to financial resources and the state of formation of financial infrastructure. Banks, which are the main subjects of this infrastructure, cannot meet all the needs of business entities and the population for financial resources. Therefore, in this area of activity, along with banks, the presence of non-banking structures is required. In Uzbekistan, microcredit organizations mainly operate as such structures. Such organizations usually include pawnshops, microcredit organizations created in various organizational and legal forms. Based on the latest legislative changes, banks now also provide microcredit and microloan services, which indicates that banks are also a type of microcredit organization. In turn, such diversity in the status of subjectivity of microcredit organizations is reflected in the legal regulation of their activities.

In the legal regulation of the activities of microcredit organizations, methods, mechanisms, and means of various branches of law are used, and this means the complexity of legal regulation of this area. For example, if the organization of the activities of microcredit organizations, the execution of relevant documents for carrying out activities, and the control of their activities are regulated by administrative and legal methods, then the grounds and procedure for the creation and liquidation of microcredit organizations, the services they provide, and contracts concluded by microcredit organizations fall under the scope of regulation of civil law. Therefore, in the legal regulation of the activities of microcredit organizations, civil law regulation occupies one of the central places.

In the context of market relations, the active participation of subjects in civil transactions is of particular importance for the economic development of each country. It should be noted that the share of service relations in the active participation of subjects in civil transactions is increasing. The expansion of types and methods of service provision as a result of the emergence of new economic relations requires their consistent legal regulation.

Financial services are also important in civil law as a specific type of service. Typically, financial services are understood as the provision of loans, credits, or other types of transactions to subjects of civil law by banks or persons licensed to provide such services in accordance with the law, on certain terms and for a fee. Microfinance services are a specific type of financial service. Usually, the terms "micro" and "macro" are used as indicators that determine the quantity of a particular state, thing, attitude, reality in terms of volume or significance, value. For example, A. Mukhammadiev proposes to divide the principles of civil law into macro and micro principles [1].

Microfinancing also means that financing is carried out in smaller indicators, and in this case, the part of the implemented loans that does not exceed a certain amount or amount is defined by the state as microfinancing.

As can be seen from this definition, microfinancing is the implementation of types of financing activities (microcredit, microloan, microleasing), expressed in legislation, in an amount not exceeding the established amount. The maximum amount for each type of microfinancing is established by law. For example, for a microloan, the maximum amount of service is one thousand times the minimum wage, and for a microloan, one hundred times the minimum wage. In this case, the amount of financing cannot exceed this amount. After all, microfinancing is not carried out in all financial

institutions. It is established by law that this type of activity is carried out by a financial organization, usually called a microfinance organization.

According to T.T. Madumarov, who studied the activities of microcredit organizations, a microcredit organization is understood as a legal entity established in any organizational and legal form, with the exception of prohibitions established by law, providing financial resources in the amount established by law, with or without the condition of providing security for small business entities and low-income segments of the population, providing services in the field of microcredit, microloan, microleasing and other financial services provided for by law[2].

A.V. Chirikov characterizes a microcredit organization as an entity carrying out activities that provides loans to citizens and small business entities in an amount limited by law for the purpose of obtaining profit or achieving a socially beneficial goal [3].

As can be seen, a microcredit organization is also a legal entity. As a legal entity, a microcredit organization operates with the aim of making a profit. After all, the services provided by him are always paid. For example, according to Article 744 of the Civil Code, the borrower undertakes to repay the loan amount and pay interest on it. The interest received is automatically the profit received by the microcredit organization. From this point of view, a microcredit organization can be classified as a commercial legal entity.

It is known that in the context of market relations, the legal capacity of legal entities is assessed as universal legal capacity. That is, in a market economy, the application of the principle of permissiveness (dispositiveness) for what is not prohibited by law allowed legal entities to operate in a wide range of economic relations [4]. However, it is important to remember that legislation regulating the activities of a specific legal entity or the charters of legal entities may also establish restrictions on the scope of their activities. Such restrictions usually imply the development of a certain sphere by the state. For example, the main activity of banks is the provision of financial services.

Based on this circumstance, the legislator, in order to develop microcredit relations in the Republic of Uzbekistan, establishes a norm defining the scope of the legal capacity of microcredit organizations. In accordance with the Law of the Republic of Uzbekistan dated April 20, 2022, No. ZRU-765 "On Non-Banking Credit Organizations and Microfinance Activities," a microcredit organization is not entitled to directly engage in production, insurance, trade intermediation, and other activities not provided for by this Law.

As can be seen, microcredit organizations cannot directly engage in activities not stipulated by law. This implies that the legal capacity of microcredit organizations is a special legal capacity and means the specifics of the direction of activity of microcredit organizations and the rights and obligations arising from it. This peculiarity is determined by the strict definition of the scope of activity of microcredit organizations and their focus only on a specific area.

It should be noted that microcredit organizations occupy a special place in the development of economic relations in our country. Indeed, by providing microloans, it is possible to develop the activities of small and medium-sized businesses and assist citizens in purchasing consumer goods. Microleasing by microcredit organizations plays an important role in the production activities of small businesses and the provision of equipment to farms.

A microcredit organization, like a bank, has the right to open bank accounts in the territory of the Republic of Uzbekistan in the prescribed manner. In this case, the microcredit organization must obtain the appropriate license.

It should be noted that a microcredit organization is not an organizational and legal form of a legal entity. A microcredit organization is an organization carrying out specific activities. It establishes a dispositive rule regarding the organizational and legal form of a microcredit organization. In accordance with the legislation, it can be created in any organizational and legal form. As such an organizational and legal form, one can include joint-stock companies, limited liability companies or additional liability companies, private enterprises, etc.

The circle of founders of a microcredit organization is limited by law. Although the Law of the Republic of Uzbekistan dated April 20, 2022 No. ZRU-765 "On Non-Banking Credit

Organizations and Microfinancing Activities" establishes that microcredit organizations may be created by legal entities and (or) individuals, part 2 of this article establishes that microcredit organizations cannot be created by state bodies, political parties, trade unions and religious organizations. This means that microcredit organizations can be created only on the basis of private property.

A microcredit organization must also have its own company name. The company name of a microcredit organization must contain the phrase "microcredit organization" and not be identical to the company name of other microcredit organizations. A legal entity that does not meet the requirements of this Law is not entitled to use the phrase "microcredit organization" in its name. A microcredit organization must have a seal with its full company name in the state language and an indication of its location. The seal may simultaneously indicate the company name in another language. A microcredit organization has the right to have stamps, forms, and its own emblem with its name.

These rules also apply to microcredit organizations. As a legal entity, a microcredit organization also operates on the basis of its constituent documents. The constituent documents of a microcredit organization are the charter, the founding agreement, and the founding decision. The constituent documents of microcredit organizations, along with the provisions provided for by Article 43 of the Civil Code for all types of legal entities, as well as the provisions established by legislative acts regulating the activities of legal entities of the organizational and legal form in which the microcredit organization is created, in relation to the constituent documents, must contain the following information:

- on activities for the provision of microcredits, microloans, microleasing and other microfinance services;
- on the structure and powers of governing bodies;
- on the sources of formation of funds for the provision of microloans, microloans, microleasing and other microfinance services;
- the audit procedure in the microcredit organization is correct.

When forming the authorized capital of a microcredit organization, the use of funds received on credit, as collateral, and other borrowed funds is not allowed.

The minimum amount of the authorized capital of a microcredit organization must be formed only from monetary funds on the date of application for a license.

In conclusion, it should be noted that the development of credit relations in the country regulates relations. At the same time, the study of the activities of microcredit organizations should be carried out in conjunction with the improvement of the mechanism for regulating the activities of credit organizations, which are considered a unique new entity. After all, the activities of microcredit organizations, the advantages and acceptability of the services they provide, should be demonstrated in practice.

REGIONAL CRIMINAL SECURITY LEVEL OF THE REPUBLIC OF KARAKALPAKSTAN

Turdimambetov I.R[1]., Urazimbetova Yu.Kh[2].
Professor of the Department of Economic and Social Geography, Karakalpak State University[1], assistant[2]

Summary: *The dissertation examines regional differences in crime rates within the Republic of Karakalpakstan based on statistical data from 2014 to 2023, highlighting variations in criminal activity between different regions. The study also evaluates these differences using optimistic, realistic, and pessimistic scenarios. The research findings underscore the need for further refinement of regional security policies.*

Key words: *demographic and social factors, forecast, regional security policy, optimistic, realistic, pessimistic.*

Introduction. In the study of regional crime, determining the level of criminal security of regions is one of the important scientific tasks. The level of criminal safety is a criterion for assessing the danger of committing a crime in a certain territory and its social consequences, based on quantitative and qualitative indicators of the crime. It is closely related to the decrease in the level of crime in society, the sense of security of citizens, and the effective work of law enforcement agencies [1. p. 17-24).

The concept of criminal security has been formed as a separate scientific direction in modern socio-geographical research. Adolphe Quetelet was the founder of statistical analysis of crime, while André-Michel Guerry applied the method of territorial mapping of crime. Shaw and McKay (Chicago School) studied crime in connection with urbanization and the social environment. The decrease in the level of crime in society is directly related to the feeling of freedom and confidence of citizens in their life activities, as well as the effective activity of law enforcement agencies. In the context of the Republic of Karakalpakstan, the study of the level of criminal security is relevant, since this territory consists of administrative units with different socio-economic indicators, and the level of crime also differs significantly from region to region[6].

Results. The scientific significance of assessing regional crime lies in the fact that, by determining the level of security in the regions, it becomes possible to identify criminogenic territories, identify the factors influencing their formation, and develop practical measures. Analysis of the level of criminal security is an important foundation for reducing crime, improving the social environment, and effectively implementing state security policy at the regional level.

Adolphe Quetelet (Belgium 1833) - founder of the statistical analysis of crime. André-Michel Guerry (France 1833) - used the method of territorial mapping of crime. Shaw and McKay (USA, Chicago School 1942) - studied crime in connection with urbanization and the social environment. These experiments serve as a scientific basis for identifying regional differences in crime, using the example of Karakalpakstan [2].

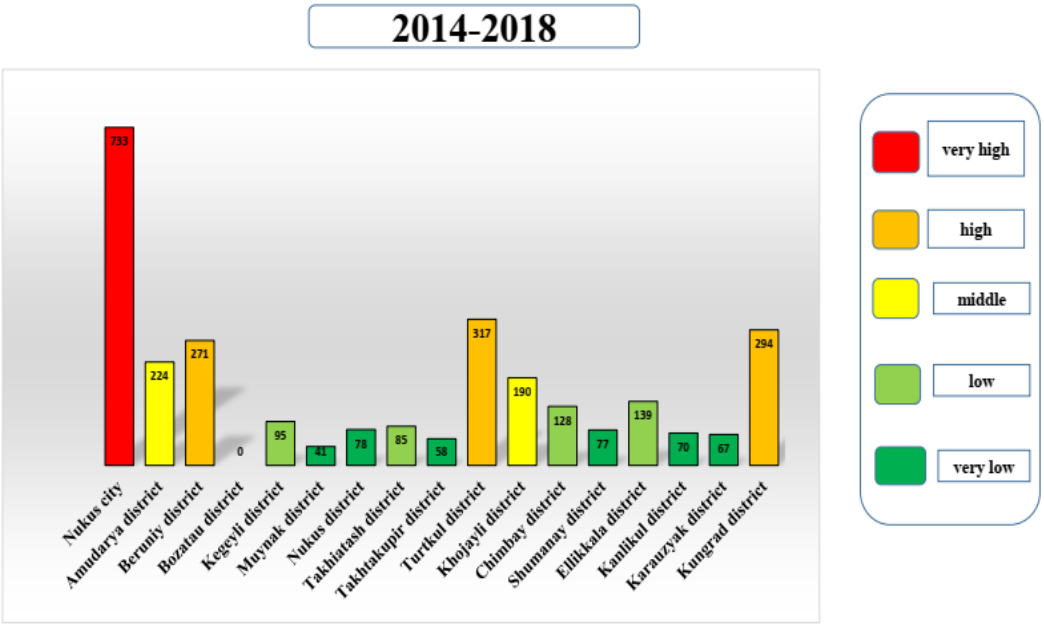

Figure 1. Territorial dynamics of crime rates registered in the Republic of Karakalpakstan in 2014-2018.

It reflects the average indicators of the number of registered crimes and their level in the administrative-territorial units of the Republic of Karakalpakstan in 2014-2018. Their reflected levels.

Territories with a very high level of crime: The region with a very high number of crimes in the republic is the city of Nukus. 733; this is due to the status of the capital, population density, and economic development.

High-level regions: Beruniy district. 271; Turtkul District 317; Kungrad district 294; these districts also have significantly higher crime rates than the national average.

Moderate regions: Amudarya district. 224; Khojeyli District 190; the crime rate in these districts is somewhat similar to the national average.

Low-Level Areas: Kegayli District. 95; Takhiatash District 85; Chimbay district 128; Ellikkala District 139; crime rates in these districts are below the national average.

Territories with a very low level: Muynak district. 41; Nukus District 78; Takhtakupyr District 58; Shumanay District 77; Kanlykul District 70; Karauzyak District 67; the crime rate in these districts is very low, which may indicate that crime prevention work is being carried out effectively in these areas. Bozatau District 0; This district was merged into Kegeyli District in 2004. Yangi Bozatau District was officially reorganized in August 2019 .

In the Republic of Karakalpakstan, crime rates differ significantly by region. The city of Nukus occupies a very high place in the absolute number of crimes, which is due to the urbanization and population concentration characteristic of urban areas. In a number of districts, for example, in Muynak, Takhtakupyr, Karauzyak, and Kanlykul, the crime rate is very low, which indicates that effective work is being carried out in these areas to maintain law and order. The zero indicator in the Bozatau district deserves special attention (Fig. 1).

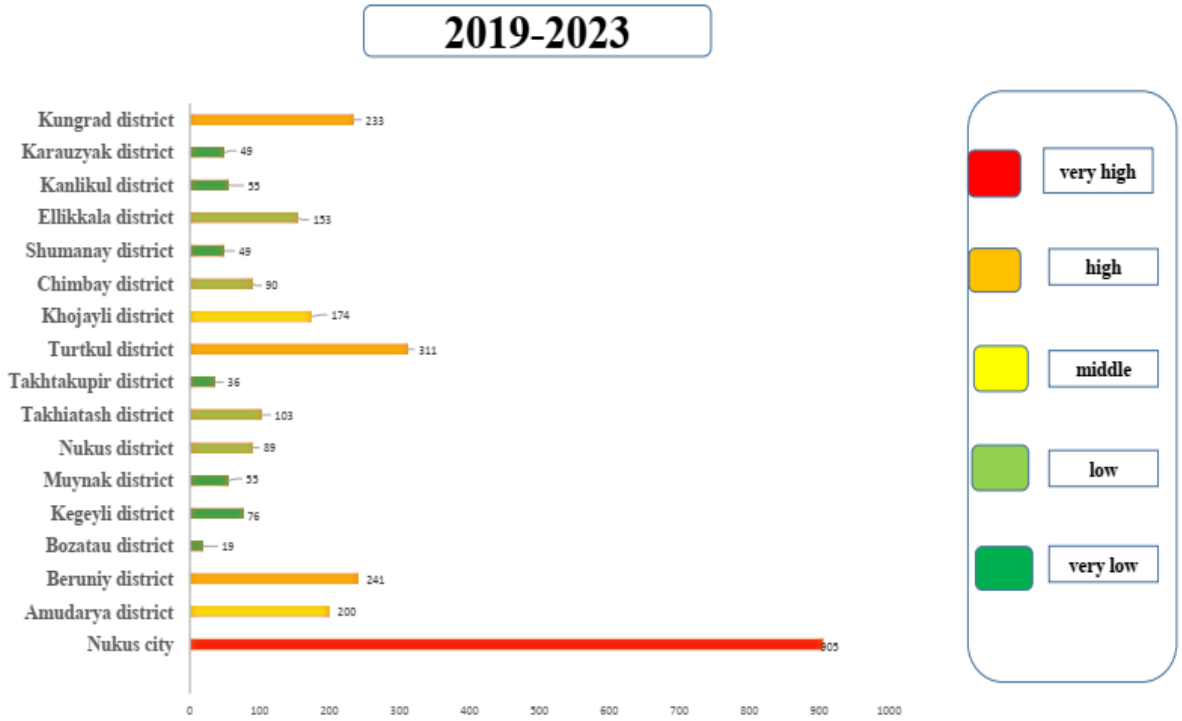

Figure 2. Territorial dynamics of crime rates registered in the Republic of Karakalpakstan in 2019-2023.

Provides average indicators of the number of registered crimes and their level by administrative-territorial units of the Republic of Karakalpakstan in 2019-2023. The average number of registered crimes in the Republic of Karakalpakstan is 167, which is assessed at the “average” level. This indicator shows that it has practically not changed from 166 in 2014-2018.

Very high-level regions: Nukus city. 905; As in the previous period, the republic remains a region with a very high crime rate. This indicator has significantly increased from 733 in 2014-2018, which indicates an increase in the dynamics of crime in the city.

High-level regions: Beruniy district. 241; Turtkul District 311; Kungrad district 233; the crime rate in these districts is also significantly higher than the national average. Compared to the previous period, the number of crimes in the Turtkul district practically did not change, while a slight decrease was observed in the Beruniy and Kungrad districts.

Moderate regions: Amudarya district. 200; Khojeyli District 174; the crime rate in these districts corresponds to the national average. A slight decrease compared to the previous period was observed in the Amudarya and Khojeyli districts.

Low-level regions: Nukus district. 89; - It has moved from a very low level in the previous period to a low level. Takhiatash District 103; - It remains at the low level of the previous period, but the number of crimes has increased. Chimbay district 90; - It remains at the low level of the previous period, but the number of crimes has decreased. Ellikkala District 153; - Remaining at the low level of the previous period, but the number of crimes has increased.

Territories with a very low level: Bozatau district. 19; - Although it increased by 19 compared to the previous period, it is still at a very low level. Kegeyli District 76; - Compared to the previous period, the number of crimes has decreased. Muynak district 55; - Compared to the previous period, the number of crimes has increased, but it is still very low. Takhtakupyr District 36; - Compared to the previous period, the number of crimes has decreased. Shumanay District 49; - Compared to the previous period, the number of crimes has decreased. Kanlykul District 55; - Compared to the previous period, the number of crimes has decreased. Karauzyak District 49; -

Compared to the previous period, the number of crimes has decreased. The crime rate in these districts remains very low (Figure 2).

In 2019-2023, the number of registered crimes in the city of Nukus increased significantly compared to the previous period, which indicates the need to pay special attention to the criminogenic situation in the capital. Stability of the average indicator for the republic: The average indicator for the republic as a whole 167 166 practically did not change from the previous period. This means that in some regions the number of crimes has increased, while in others it has decreased or remained stable.

Stability of districts with a very low level: Many districts of Kegeyli, Takhtakupyr, Shumanay, Kanlykul, Karauzyak maintained or even reduced the crime rate at a very low level.

Increase in crimes in some districts: In Nukus and Takhiatash districts, the number of crimes increased compared to the previous period.

In general, it is important to take into account regional characteristics in the fight against crime in the Republic of Karakalpakstan, especially in the city of Nukus, to strengthen measures for the prevention and prophylaxis of crimes.

Conclusion. Regional security level

- ✓ High-risk areas: Nukus city, Nukus district, Muynak district.
- ✓ Regions where a positive trend is observed: Takhiatash, Kungrad.
- ✓ Low-risk areas: Chimbay, Kegeyli, Ellikkala.Scenarios.

Optimistic scenario - economic growth will stabilize, crime will decrease by 10-12% by 2030. Realistic scenario - current conditions will remain, crime will decrease steadily or slowly. Pessimistic scenario - economic and environmental problems will intensify, crime will increase by 5-7%. When analyzing crime, it is important to consider geographical and demographic factors. In high-risk areas, enhanced preventive measures are necessary. Establishing monitoring of "hot spots" based on GIS will increase efficiency. Mitigating the consequences of migration and ensuring youth employment will remain the main direction in reducing crime.

Three scenarios (optimistic, pessimistic, and realistic) were developed for the prospective evolution of the criminogenic situation. Each scenario takes into account the impact of socio-economic changes and state policies (Fig. 3).

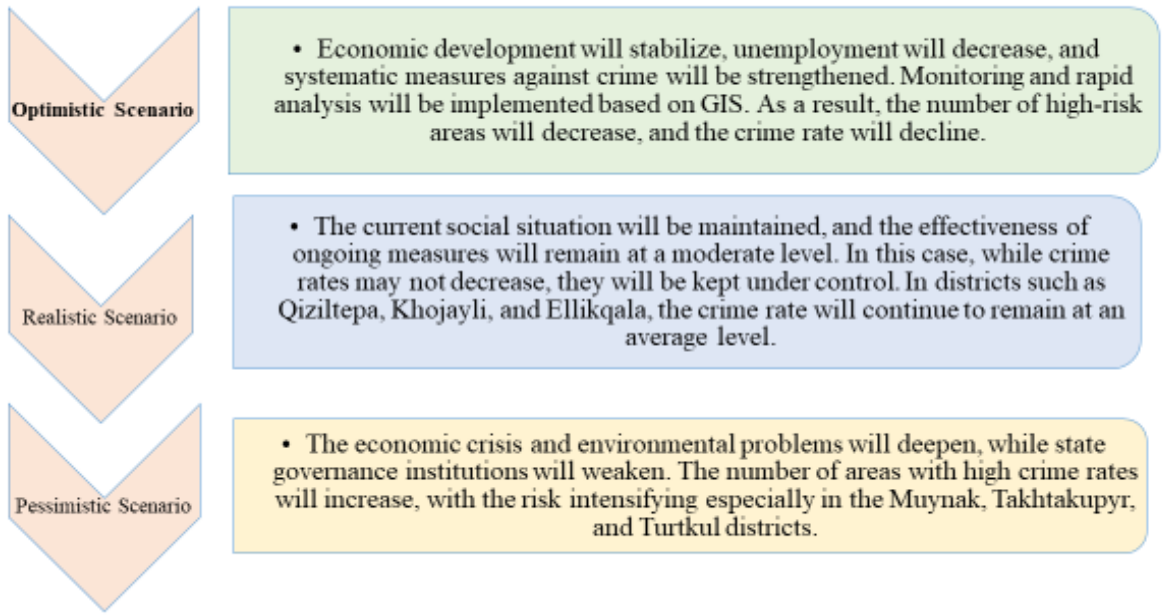

Figure 3. Three main development scenarios based on the assessment of the crime situation and identification of high-risk areas in the Republic of Karakalpakstan.

Each scenario serves as a foundation for shaping regional policy, developing security strategies, and efficiently allocating resources. In particular, the implementation of spatial crime monitoring and preventive analysis using GIS technologies enables the development of proactive strategies based on these scenarios[5].

An optimistic scenario is a forecast that expresses confidence in future social stability and a decrease in crime rates.

Expected positive outcomes. Reduction of regional risk zones. GIS identifies hazardous areas; Resources are directed specifically to regions in difficult situations; Crime prevention is carried out in a targeted manner; As a result, the number of high-risk districts decreases, for example, Muynak, Turtkul, and Beruniy districts gradually transition to “yellow” or “green” zones.

Decrease in crime rates. Employment is ensured → economic crimes are reduced; Rehabilitation and social programs are launched for youth and the unemployed; The reliability of the law enforcement system increases; Social trust between the population and the state is restored.

An environment for sustainable development is formed. Social balance is also restored in the ecological regions of the Aral Sea area; Internal migration flows decrease (people remain in their own territories); The types of crimes (diversification) narrow.

A realistic scenario allows consideration of crime and social stability issues based on the current real situation. This assumes the preservation of the existing economic, social, and institutional conditions in the current circumstances.

The essence of a realistic scenario. Although government and public sector actions are present, they are limited by moderate effectiveness, and while the risk of a sharp increase in crime is low, its stabilization is also slow.

Analysis of districts with moderate crime levels. Karauzyak District. There are industries and services, but stable jobs are still insufficient; Main types of crimes: theft, petty fraud, domestic violence; There is control, but social prevention is weak.

Khojeyli district. Due to its proximity to Nukus, the migration flow is high; Crimes include transport-related offenses, conflicts involving migrants, and fraud; The law enforcement system is active, but stable social infrastructure is insufficient.

Ellikkala District. A rapidly growing demographic region; Strong pressure on social services: education, healthcare, utilities; Crime rate is stable, but there are risk zones in newly developed areas.

A pessimistic scenario reflects a situation where negative factors leading to an increase in crime have intensified. It represents a state where the existing socio-economic and environmental conditions have sharply deteriorated, governance has been institutionally weakened, and crime is at risk of spiraling out of control.

Districts with a high probability of increasing crime rates.

Muynak District. At the epicenter of ecological disaster; Living conditions of the population are worsening → forced migration is intensifying; The labor market is disappearing, youth are becoming prone to crime; Crimes include: theft, vandalism, drug abuse, illegal migration.

Takhtakupyr District. Harsh climate and resource scarcity exacerbate social tensions; Problems with food and water supply cause discontent among the population; Crimes include: group attacks, confrontations, threat of social unrest.

Turtkul District. High population density and migration. Unemployment is the main factor of social risk. Crimes: petty crimes become widespread, organized crime types increase (smuggling, racketeering, fraud).

Visual results of the scenario. The number of "red zones" on the crime map increases. Risk zones identified by GIS are expanding. Population attempts to leave their territory → demographic depletion. Migration pressure shifts to other regions → secondary social instability [5].

Therefore, in conclusion,

An optimistic scenario allows for reducing crime through socio-economic reforms, increasing employment, strengthening security measures, and GIS-based governance.

This situation is reflected in the crime map of the Republic of Karakalpakstan: a decrease in "red" zones, stabilization of dangerous areas, a reduction in migration pressure, and the restoration of social balance.

A realistic scenario is a situation that occurs when existing social, economic, and institutional conditions remain unchanged. Under these circumstances, crime remains a priority threat but stays under state control. The number of high-risk areas will neither increase nor decrease. Karauzyak, Khojeyli, and Ellikkala districts are areas suited to this scenario, maintaining a moderate level of crime. If no additional measures are taken, the realistic scenario also includes the risk of transitioning to a pessimistic state in the long term.

A pessimistic scenario is a situation with a high probability of a crime surge due to economic crisis, environmental disaster, and weakening governance. Muynak, Takhtakupyr, and Turtkul districts are at the center of this dangerous scenario. To address this situation, emergency measures, social protection programs, and GIS-based monitoring are required.

The main objective was to conduct a comprehensive analysis of the crime situation in the Republic of Karakalpakstan based on geographical and statistical approaches, assess the current situation, forecast future changes, and develop development scenarios.

TYPES OF INDEPENDENT CREATIVE WORK OF STUDENTS IN THE SUBJECT OF "PEDAGOGICAL TECHNOLOGY"

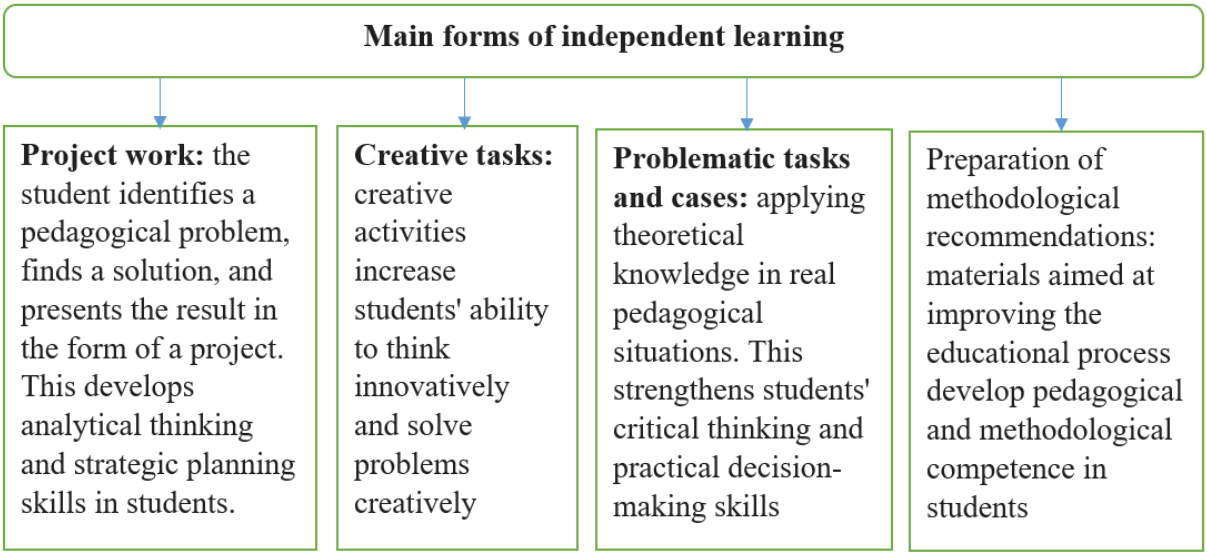
Isabayeva M.M., Jabborov T.M.
Kokand State University
E-mail: toxirjonjabborov05@gmail.com

Summary: *This article scientifically and analytically covers the types and pedagogical significance of students' independent creative activity in the subject of pedagogical technology. It discusses the types of independent work of students in independent education, such as problem analysis, information search, practical testing, and creative product creation. At the same time, the reflexive process and project presentation are also analyzed as important factors in improving independent creative activity. The results of the article provide an opportunity to use them as a practical guide in organizing and developing independent creative activity of students in higher educational institutions.*

Key words: *Pedagogical technology, independent work, creative activity, pedagogy students, practice, reflection.*

Introduction

Pedagogical technology is an innovative pedagogical creation that helps to increase the creative potential of students, improve their analytical and research skills. In all three technologies, the student is the main subject of his/her activity, actively participating in independent information search and problem solving. Design educational technology is the main mechanism for the effective development of this process. It orients the student to purposeful research, problem identification and creative solution. Therefore, independent creative work carried out on the basis of production technology strengthens the student's critical thinking, practical experience and problem solving. Research methodology. In the research methodology, the opportunity of using pedagogical technology in the educational environment to use the purpose, content, organizational forms, methods and means of independent learning of students was appropriately used. Designing the educational process is a process of developing a project (scheme) for the effective organization of a particular educational process, taking into account all factors. Literature review on the topic. The issue of forming independent creative activity of students in the system of teaching pedagogical technologies is at the center of modern pedagogical research. In primary scientific sources, independent creative activity is interpreted as a factor strengthening the student's position as a subject in the educational process and is indicated as one of the main tasks of pedagogical technology. In his work "Pedagogical Technologies and Pedagogical Skills" by Q.M. Ziyoyotov, he substantiates the central place of independent learning in the system of pedagogical technologies and emphasizes that the formation of creative competencies in students is directly related to the technological design of the educational process. The author shows that it is possible to develop reflective and creative thinking in students by setting clear goals in education, planning result-oriented tasks, and systematically organizing independently performed creative activities [1].



F.N. Turaqulov deeply analyzes the potential of innovative educational technologies to increase students' independent activity. In his opinion, the introduction of case technology, problem-based learning, and creative tasks based on ICT forms students' ability to independently search for information, analyze, draw scientific conclusions, and find creative solutions. The author substantiates the effectiveness of these technologies in practice with specific examples [2]. O.Sh. Sayfullayev analyzes the theoretical foundations of modern pedagogical technologies and recognizes the effectiveness of interactive methods, trainings, creative problem situations, and project activities in organizing students' creative independence. According to the author, these methods provide students with innovative thinking, independent decision-making and competent activity[3]. In the analysis of existing scientific articles, R.R. Abdullayev highlights the importance of innovative approaches to organizing independent learning in higher education and proposes to restructure

practical exercises and forms of control in a way that encourages independent learning. His research is significant in that it has developed a model of educational technologies that enhance independent thinking, critical approach and creative decision-making in students[4]. M.Y.

Tojiboyeva, studying the system of independent creative works in the field of pedagogical technology, divides them into such types as abstract, essay, project, practical creative task, problem assignment. The author scientifically substantiates that each of these types develops independent research, creative thinking, and practical application of scientific and theoretical knowledge in students[5]. B.B. Nurmatov, studying the methods of forming creative thinking in his article, emphasizes that creative tasks, analytical problems, and research-oriented tasks increase independent thinking and scientific creativity in students [6].

Analysis of research dissertations shows that scientific and methodological work in this area is continuously developing. N.S. Yuldasheva developed a model for the development of independent learning competencies and outlined its technological foundations[7]. J.T. Tursunov developed and tested a methodology for the formation of creative activity based on pedagogical technologies[8]. D.Kh. Abdurasulova identified the pedagogical conditions for organizing independent learning in the context of innovative technologies and suggested ways to increase the effectiveness of the educational process[9].

Analysis and results. Independent learning is the process of each student independently developing their own knowledge, skills and creative potential. This process is an important part of the pedagogical technology of transferring students from theoretical knowledge to practical competencies. The analysis revealed that the main forms of independent learning are project work, creative assignments, problem tasks and cases, preparation of methodological recommendations, etc., and constitute the following pedagogical content (see Figure 1).

Independent learning is one of the central components of the educational process, serving to form the student's personal educational activity, independently manage their own learning process, and develop creative thinking. Analysis of pedagogical theories shows that independent learning not only enriches the learning process, but also plays a decisive role in the formation of a person's professional competencies. Pedagogical competencies such as analytical thinking, independent problem solving, research, information processing, and analysis of results are formed precisely through independent learning tasks.

In the course of the research, the activities of students of the pedagogical direction on the types of independent educational tasks were evaluated using a comparative-experimental method. The criteria for evaluating independent education were: independent search and analysis of information, completion of creative and project tasks, preparation of methodological materials and development of recommendations, and reflection and self-assessment.

Initially, the independent educational work of students was analyzed to identify and find solutions to pedagogical issues on project tasks.

Result: 38% of students were able to effectively complete project work at the initial stage, but after the experiment this figure reached 73%.

Creative tasks. Educational task: Use new pedagogical methods, develop their own approaches.

Result: Initially, 35% of students showed high levels of creative work, after the experiment this figure increased to 70%.

Problem tasks and cases. Educational task: Combine theoretical knowledge with practical activities.

Result: Initially, 40% of students were able to fully complete problem tasks, after the experiment this figure increased to 75%.

Methodological recommendations and manuals. Educational task: Develop materials to improve the educational process.

Result: Initially, 25% of students prepared methodological materials, after the experiment this figure increased to 62%.

Analysis of pedagogical theories shows that independent learning is a decisive factor in the intellectual, professional and spiritual development of a person. It improves the educational process in accordance with the principles of person-centered, competency-based and active learning.

Conclusion and recommendations. The results of the study showed that independent learning plays an important role in the application of theoretical knowledge in practice, the development of creative and critical thinking, the formation of personal responsibility and self-management skills.

It is necessary to develop independent learning tasks in accordance with the level of complexity and creative requirements in the subjects, clearly define the assessment criteria and expected results. Instead of a recommendation, it can be said that monitoring and managing student activities through digital resources, electronic portfolios, virtual laboratories and online platforms will help to strengthen them. It is recommended to create methodological guides, sample tasks and assessment matrices for independent work, as well as constantly update them. Monitoring students' independent learning competencies and drawing up individual development plans each semester increases efficiency. Evaluating the results of students' independent work through rating and incentive mechanisms, linking them to real life and professional activities, increases motivation. Completing independent tasks in an integrated manner across several subjects develops students' systematic thinking.

THE ROLE OF NATIONAL MUSIC ART IN SHAPING THE SPIRITUAL AND CULTURAL DEVELOPMENT OF YOUTH

Fayzullayev E.M.
Jizzakh State Pedagogical University

Summary: *Under the influence of musical art, students develop moral and aesthetic concepts such as the desire for beauty, decency, honesty, kindness, friendship, as well as such aesthetics as self-control, modesty, sweetness, cleanliness and elegance in clothing. The qualities of culture are formed, opinions are expressed on the role of national musical art in the formation of youth culture as a means of spiritual and cultural events.*

Key words: *music, culture, art, spiritual and educational, moral and aesthetic, musical culture.*

Since time immemorial, our wise people have considered music and song an integral part of their social and cultural life. Teaching a child to sing and play musical instruments was considered a family aspiration, and it was customary to keep a musical instrument in the home with benevolent intentions. It was no accident that a newborn would be soothed by a mother's plaintive lullaby during their first swaddling, that a melodious call to prayer (adhan) would be recited into the infant's ear at the naming ceremony, and that a boy's circumcision would take place to the mournful sounds of the surnay. Our great and wise ancestors deeply understood the ability of melodies and tunes to quickly find their way into an infant's heart, positively influence their emotional world, and lead them towards goodness.

Youth is the spring of a person’s life. All admirable traits as well as undesirable habits begin to form in youth. If a person is not drawn from an early age into the realm of refinement and is not raised in the spirit of the finest virtues, they will hesitate and falter later at life’s crossroads. For this reason, an important part of moral education should start in youth — in particular, systematic music instruction should be introduced from an early age.

We observe that great scholars of the East, such as Ibn Sina, Farabi, Beruni, Kawkabi, Hazrat Navoi, Omar Khayyam, and Jami, who gained worldwide renown, also devoted considerable attention to the science of music. We know that they unequivocally emphasized the significant role of music art in human upbringing and its paramount importance in an individual's culture and spiritual development in general.

Art is a form of social consciousness, and upon broader reflection, true art signifies an ideal ideology. It is not an exaggeration to suggest that art can positively resolve issues that even highly developed science and technology cannot, and achieve significant transformations in humanity's destiny. Particularly among the ancient arts, music holds a special position as an art inherently characteristic of humans, with unparalleled power of influence. Ample noteworthy ideas regarding music's high artistic-aesthetic value, its potent spiritual-moral impact, and its pedagogical significance can be found in scientific and literary works dating back to the Middle Ages. Our ancestors revered music for centuries as divine beauty and a delicate art. Furthermore, we ourselves cannot imagine our daily lives without music.

We know that pride, in general, is unequivocally emphasized as holding a paramount position in spirituality. In the words of Aristotle, "Music is capable of influencing the ethical-aesthetic aspects of the soul. Given that music possesses such characteristics, it must therefore be included among the means of educating youth."

Abu Ali ibn Sina, known worldwide as "Avicenna," was not only a physician but also a renowned musicologist. Even a legend associated with the creation of the rebek (ghijjak) is dedicated to Ibn Sina: it is said that the person who invented this instrument and played melodies on it was the great hakim. According to his work, "Kitab ash-Shifa" (The Book of Healing), music is one of the aesthetic tools that heals the human spirit and exerts a powerful influence on the human heart.

Alisher Navoi, possessing a refined taste and high intellect, loved to listen to music and derived profound joy from it. The poet always cared for talented artists and tirelessly concerned himself with the development of youth. He understood that benefiting from the art of music is one of the primary means for a person's attainment of perfection. A poet who does not love music is like an empty garden, a withered spring. Navoi states, "A poet who does not comprehend music, what kind of poet is he?"

Aristotle wrote: "If music has the power to influence the soul morally, then it must certainly be included among the manuals for the education of youth." The great scholar Farabi, who deeply researched the science of music and musicology, was also deeply convinced of the connection between music and morality: "This science balances the character of people who have lost their equilibrium, perfects a character that has not reached perfection, and maintains the equilibrium of those whose character is already balanced." Beethoven, who desired that music should ignite fire from the human heart, assessed it as follows: "....." (the sentence is incomplete).

Abdul Rahman Jami, in his "Treatise on Music," reflecting on maqams, stated with admiration: "Know that in addition to the general characteristic of providing pleasure to people, each of the 12 maqams, and each vocalization and branch thereof, possesses a specific power of influence. For example: Ushshoq, Navo, and Boʻsalik awaken power and courage in the listener, whereas the voice alone does not possess such an influential power."

The immortal works of Alisher Navoi, the sultan of the realm of words and a possessor of high culture, along with the scientific research written about him, attest not only to his being a highly intelligent, encyclopedic scholar of his era but also to his being a sensitive soul who deeply understood art and was profoundly affected by the magic of musical melodies. It is not inconceivable that A. Navoi was also a musicologist and composer of his time, for he was fully aware of the level of development of music art in his era, guided artists, and is known to have even written a special treatise, "Risolai Musiqa" (Treatise on Music), dedicated to music. He strived for his written poems and ghazals to possess an exceptionally musical resonance. Therefore, as Ogahiy puts it, "There is no greater benefit than Navoi's melody." In Navoi's opinion, every poet should know how to compose a melody to some extent; a poet who can play an instrument can write fluid musical verses, and the inability to produce sound on any instrument is a flaw in poets. Consequently, poetry and music should always be harmonious and mutually intertwined.

A person engaged in music "will not stain themselves with inappropriate actions, but rather will derive immense benefit and profit, performing useful deeds for themselves and their homeland."

Farabi, in addition to being an encyclopedic scholar, was also a great musicologist. His activities in the field of music science were not confined solely to theoretical perspectives but also found expression in his practical work. There are many accounts of Farabi having created a musical instrument, which was an innovation for his time, and being known as a skilled musician and composer.

When discussing the causes that give rise to the science of music, Farabi draws attention to the moral and educational aspects of music in general. "This science is useful in the sense that," writes Farabi in his work "Iḥṣāʾ al-ʿulūm" (The Enumeration of the Sciences), "it regulates the character of those who have lost their equilibrium, perfects a character that has not reached perfection, and maintains the equilibrium of those whose character is already balanced. This science is also beneficial for the health of the body, because if the body is sick, the soul also languishes; if the body encounters an obstacle, the soul also encounters an obstacle. Therefore, through the aid of restoring the soul's health by the influence of sounds, the body is also improved, and the soul is healed by the regulation of its powers and its adaptation to its circumstances."

It is said that al-Farabi himself was a skilled performer of the qanun, and a composer. According to legends, he invented a new instrument. In terms of his musical pedagogical views, al-Farabi was of the same opinion as the ancient Greek scholars. They considered music a necessary subject of education and upbringing. According to ancient Greek scholars, just as gymnastics shapes the bodies and physiques of people, music is considered a tool capable of shaping the human soul.

"Eastern music," said our first President I.A. Karimov in his speech at the opening ceremony of the "Sharq Taronalari" (Melodies of the Orient) International Music Festival, "is an integral part of Eastern philosophy and the Eastern world. The role of Eastern music in the global community is immensely great... This music has been purifying the hearts of people and spiritually uplifting them for thousands of years. With its delicate charm, it nourishes world culture and makes a worthy contribution to universal human values."

Music is an educational tool with immense expressive power. Music is a spiritual nourishment that can give life-giving strength to the human psyche. It helps people to enjoy, to revel, to relax, to find solace, to think, and to engage in philosophical reflection.

The educational significance of spiritual and educational events is also evident in promoting the idea of national independence. Since one of the crucial functions of the idea of national independence is the upbringing of youth, spiritual and educational events further enhance their pedagogical impact on young people by promoting this idea.

Instilling the idea of national independence in the minds of student-youth stands at the center of the educational work carried out within the educational system. Various methods and means of education are employed to achieve this goal. Our observations have shown that in some educational institutions, more attention is given to lectures, seminars, and colloquiums on the idea of national independence, while spiritual and educational events held after lessons are not given sufficient importance. However, such events hold immense significance in educating youth and instilling the idea of national independence in their consciousness.

Given the current emphasis on using interactive methods in our country's education system, the application of spiritual and educational events gains even greater importance. The experience of leading educators demonstrates that utilizing spiritual and educational events during lessons significantly increases the engagement of student-youth. Furthermore, forms of conducting classes such as role-playing and service games are, in their essence, cultural events. This is because they emerge from the integration of educational forms with elements of art. Introducing excerpts from literary works, expressive recitation of poems, and performing scenes from plays during lessons serves to sharply increase both the intellectual and emotional activity of students.

Therefore, music should not only be studied as a form of artistic creation and art, but also as a crucial component of spiritual culture.

The great composer Ludwig van Beethoven, speaking about melody, said: "Music is a declaration of the heart, higher than all wisdom and philosophy." We have been amazed, - says the famous musician Abdukhoshim Ismailov, - seeing how much our melodies, our songs and chants, have influenced peoples who do not understand our language, and how our melodies and ghazals have permeated the hearts of people in foreign lands.

Our observations conducted in general education schools, and the information we have gathered from studying the situation, show that students' interest and enthusiasm for art in general, and particularly for music lessons, has declined. The presence of a peculiar indifference to studying our national musical heritage, and the less-than-desirable state of matters concerning aesthetic emotion, aesthetic taste, and aesthetic needs, are clearly evident. These issues are implemented based on unwritten laws. In the land of Uzbekistan, the children of Uzbekistan have found themselves limited in the opportunity to comprehensively and deeply study the musical art of their ancestors, which has been ingrained in their blood and soul since their mother's lullaby.

- For various reasons, schools in our republic, and especially rural schools, have not been adequately supplied with highly knowledgeable and skilled personnel.

- Until now, general education schools have not been sufficiently provided with textbooks, manuals, methodological recommendations, and programs for music lessons.

- In many cases, due to the lack of professional and pedagogical skills among the subject teachers, this task is entrusted to non-specialists, resulting in poorly conducted lessons. The work of arousing aesthetic perception and aesthetic emotion in students through lessons, and of forming musical-aesthetic culture, is neglected, and so on.

In a word, the musical-aesthetic education being implemented in the general education schools of Uzbekistan clearly needs to be re-examined in its entirety and provided with scientific-theoretical foundations and modern methodological tools.

In nurturing students' musical and aesthetic development through lessons at school, extensively utilizing Uzbek folk music and revealing its educational potential plays a crucial role. Just as concepts like Mother Nature and Mother Earth, mother music, which begins with the cradle lullaby, is inherently close to a child's heart, feelings, and perception. The richness of our national musical art's content—be it lullabies, songs, melodies, chants, terma-lapars (folk couplets), yor-o'lan (love songs), katta ashula (grand song), or maqom (classical melodic system)—each genre, with its delightful melodies, lively and captivating rhythms, and elaborate embellishments, reflects the nature of the Uzbek people, their unique customs and traditions, in musical forms. It is natural for every student to understand it, perceive it with emotion, and derive profound joy from this process.

Organizing music lessons in school is carried out relying on important principles such as the interconnectedness of musical education and aesthetic upbringing, the scientific rigor of education, its consciousness, visual clarity, and comprehensibility, the solidity of acquired knowledge, involving all students in aesthetic activities during the educational process, connecting this activity with daily life, and achieving a synthesis of consciousness and emotion.

It is particularly important that during the process of musical education, students' interest in and appreciation for music art grow, their creative activity increases based on music lessons, and skills are formed for singing songs melodiously, listening to music with enthusiasm, perceiving and evaluating the pleasantness, melodiousness, and beauty in music through analyzing musical works.

It is particularly important that the teacher, under the influence of music art, fosters in students an aspiration for beauty, and develops ethical-aesthetic concepts such as politeness, honesty, kindness, and friendship. It is equally crucial for the formation of various qualities of aesthetic culture, such as self-control, modesty, pleasant speech, and neat and elegant attire.

Uzbekistan's independence places upon us the task of elevating the spirituality of youth, fostering high cultural qualities in them, restoring our national values, deeply studying the masterpieces of our national art, and fully and effectively utilizing the educational potential of music art within the school environment. It is with deep conviction that we must view this: musical-aesthetic education within schools, starting from the very first days children enter school, from the lower grades, must be implemented effectively, measured by the scales of reason, and scientifically well-founded. Indeed, a person's early childhood years are the most productive and unique for accumulating wisdom, gathering knowledge, learning discipline, and certainly for shaping qualities of high culture. Utilizing these years with wisdom and great effectiveness must be the sacred duty of every subject teacher.

In the song curriculum included in "Music Culture" lessons in general secondary schools, dozens of works can be found that express independence, our sovereignty, our identity, our holidays and traditions, and boundless feelings for our Motherland. These works serve to foster spirituality in students.

The primary task of musical education is to cultivate students' feelings of beauty and refinement, enrich their understanding and perceptions of the world, assist in the proper formation of their artistic taste, shape moral qualities in them, and, most importantly, nurture feelings of love for the Motherland in young students through art, thereby fostering their spirituality.

These tasks are entrusted to the music teacher. By what means are these serious, pedagogically, and psychologically complex tasks accomplished? There are many paths and tools. One of these is ensuring the development of students' spirituality. This may also seem complex at first glance. However, if the music teacher is sufficiently knowledgeable, loves their work, and derives pleasure from working with children, achieving the goal is certainly possible.

The following paths and tools have been proven to yield good results in fostering spirituality in children during music lessons:

- Starting each lesson with a positive mood. Creating a lively atmosphere in the classroom and among the students, generating interest.

- Selecting a logically sound repertoire for each lesson (the program indicates that the teacher is free to choose the lesson repertoire, and may also use additional sources besides the textbook).

- Judiciously applying new pedagogical technologies in the lesson that arouse the students' interest.

- Taking into account the age characteristics of students, using more creative games, musical riddles, musical rebus puzzles, and kinetic methods.

- Continuously applying diverse activities aimed at enriching students' musical imagination and impressions from lesson to lesson.

- Utilizing live performance more in the lesson. The teacher should provide a live, bright, and expressive performance of each song and musical piece for the young listeners.

- Organizing classroom concerts (once per quarter). In these concerts, students perform the songs they have learned in music lessons individually, in duets, or in small choirs, and they also invite parallel classroom students to these concerts. (Creative musical report concerts).

- Systematically organizing individual work with students who are slow learners (low aptitude) to ensure the clean and bright resonance of the classroom choir.

- Implementing activities that not only enrich the content of the lesson but also serve to foster the creative activity of students, such as taking students beyond the confines of the lesson to various clubs, concerts, and meetings outside the classroom and school.

- Conducting numerous spiritual-educational events (conversations, meetings, debates, Q&A sessions).

In conclusion, we, as mentors and educators, must pass on the essence of national music, inherited from our ancestors, to the younger generation without diminishing its luster. Let us strive to raise music teachers who serve the interests of independent Uzbekistan, who possess a high level of knowledge of its language, religion, historical culture, literature, and art, and who are capable of living in harmony with its joys and concerns.

COMPARATIVE ANALYSIS OF LEVELS OF FORMING STUDENTS' PROBLEM-SOLVING AND EXERCISE-SOLVING SKILLS IN BIOLOGY TEACHING

Ahmedova M.M.
Kokand State University

Summary:. *This article focuses on the formation and development of problem-solving and exercise-solving skills among students in biology education. It examines the issue of improving the methodological basis for developing these skills. Specifically, the article conducts a comparative analysis of various levels or approaches for enhancing this methodological basis, scientifically and methodologically justifying the effectiveness, shortcomings, and ways to overcome them for existing approaches. The analysis identifies the most effective methodological approaches that contribute to strengthening students' practical and theoretical knowledge, and enhancing their logical thinking abilities. The article will be useful for biology teachers, methodologists, education researchers, and all specialists interested in improving the effectiveness of biology education.*

Keywords: *Problem-solving skills, exercise-solving skills, methodological basis, improvement, comparative analysis, teaching methodology, students' skills, logical thinking, didactics.*

Introduction. The educational reforms carried out in our country aim to adapt teaching to modern requirements and modernize it based on advanced foreign experiences. In connection with the modernization of school biology education, it is intended to develop students' subject-specific knowledge, skills, and competencies; generalized methods of cognitive, communicative, practical, and creative activities; and to strengthen teachers' focus on gaining experience in this process. As President Sh. M. Mirziyoyev emphasized: "We will mobilize all the power and capabilities of our state and society so that our youth grow into individuals with high intellectual and spiritual potential who can confidently compete with their peers around the world in any field" [1]. Creating a modern learning environment for students in every subject, directing them toward independent and logical thinking, and fostering their scientific worldview are considered among the main tasks of the continuous education system. In fulfilling these tasks, special attention is paid to ensuring high-quality education in general secondary schools and developing students' ideological immunity and intellectual potential in biology classes, as in other subjects. The National Curriculum for developing school education places particular emphasis on forming students' knowledge and skills and educating them in the spirit of loyalty to national and universal values [2].
